SUPPLEMENT.

THE LIFE OF SIR WALTER SCOTT

End of the Volume.

The numbers of the HISTORICAL NEWSPAPER may be bound in at the end of the volume; interspersed with the Journal according to their dates; or preserved separately. It is recommended to place them at the end of the volume.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM CHAMBERS, AUTHOR OF "THE BOOK OF SCOTLAND," "GAZETTEER OF SCOTLAND," &c.

No. 1. SATURDAY, FEBRUARY 4, 1832. PRICE THREE HALFPENCE.

THE EDITOR'S ADDRESS TO HIS READERS.

It is a custom so ancient, that I do not know when it had a beginning, for editors of newspapers, magazines, and other periodicals, large and small, to commence their labours with an apology for their intrusion, and an expression of sorrow for their deficiencies. With regard to such a venerable usage, I beg entirely to depart from it. I make no apology, and seek no undue favour. The grand leading principle by which I have been actuated, is to take advantage of the universal appetite for instruction which at present exists; to supply to that appetite food of the best kind, and in such form, and at such a price, as must suit the convenience of every man in the British dominions. Every Saturday, when the poorest labourer in the country draws his humble earnings, he shall have it in his power to purchase, with an insignificant portion of even that humble sum, a meal of healthful, useful, and agreeable mental instruction: nay, every school-boy shall be able to purchase with his pocket-money, something permanently useful—something calculated to influence his fate through life—instead of the trash upon which the grown children of the present day were wont to expend it. Entertaining such a design as this—one calculated to be of such extensive service to mankind at large—those apologies, which Johnson has already condemned as being

"With merit needless, and without it vain"—

would be unutterably ridiculous. Whether I succeed in my wishes, a very brief space of time will satisfactorily determine. I throw myself on the good sense of my countrymen for support; all I seek is a fair field wherein to exercise my industry in their service; and should Heaven in its mercy grant me that share of health, which, by its inscrutable Providence, is now denied to so many around me, I do not despair of showing such a specimen of the powers of the printing-press as has hitherto been unexampled in the history of Literature. It may, perhaps, be considered an invidious remark, when I state as my honest conviction, that the people of Great Britain and Ireland have never yet been properly cared for, in the way of presenting knowledge, under its most cheering and captivating aspect, to their immediate observation. The scheme of diffusing knowledge has certainly more than once been attempted on respectable principles, by associations established under all the advantages of an enormous capital, as well as the influence of baronial title, and the endeavour has generally been attended with beneficial results. Yet the great end has not been gained. The dearth of the publications, the harshness of official authority, and, above all, the folly of attaching the interests of political or ecclesiastical corporations to the course of instruction or reading, have, separately or conjunctly, circumscribed the limits of their operation; so that the world, on the whole, is but little the wiser with all the attempts which have in this manner been made. The strongholds of ignorance, though not unassailed, remain still to be carried. Carefully eschewing the errors into which these highly praiseworthy associations have unfortunately fallen, I take a course altogether novel. Whatever may be my political principles—and I would not be in the least degree ashamed to own and defend them—neither these principles, nor any other, which would assuredly be destructive to my present views, shall ever mingle in my observations on the conventional arrangements of civil society. Nothing could afford me more unmitigated pleasure than to learn that CHAMBERS'S EDINBURGH JOURNAL yielded equal edification and delight to the highest conservative party in the state, and to the boldest advocate of an universal democracy: or was read with

as much avidity at the cheerless firesides of the Irish Roman Catholic peasantry, as at those of the more highly cultivated Presbyterian cottars of my native land. I have voluntarily, and unprompted, taken in my hands an engine endowed with the most tremendous possibilities of mischief. I may have it now in my power to instil the most pernicious opinions on almost any subject, into the minds of three millions of human beings. But I see the straight path of moral responsibility before me, and shall, by the blessing of God, adhere to the line of rectitude and duty.

On account of certain existing laws affecting unstamped periodical publications coming out at briefer intervals than twenty-seven days, this Journal, as a matter of course, will not be expected to contain any news of general events, or any political or parliamentary intelligence. All information of that character, when wanted, must be sought for in the ordinary sevenpenny stamped newspapers. The matter which I am allowed by law to introduce into my paper is, however, such as will, I trust, be of value to readers in all grades of society. As I happen to be able to spare room, I shall present—but not too hurriedly one upon another—original and select papers on Literary and Scientific subjects, including articles on the Formation and Arrangements of Society; short Essays on Trade and Commerce; Observations on Education in its different branches, with Investigations into the Properties of our Scholastic and Academic Institutions; Sketches in Topography and Statistics, relative to Agriculture, Gardening, Planting, Sheep-farming, the making of Roads, Bridges, and Canals; the Establishment of Ferries, the best means of Conveyance by Land and Water; Increase of Population; the Uses of Machinery to simplify Human Labour, Manufactures, &c.; all indicative of the vast improvements effected in the United Kingdom and America by the skill and perseverance of their inhabitants, and of what still remains to be accomplished.—For the express use of the poor man, I shall open a continued flow of valuable and correct information for his guidance, should he be disposed or necessitated to emigrate—neither, on the one hand, buoying him up with false hopes, nor, on the other, discouraging him by gloomy anticipation.—For the benefit of poor old men and women who live in cottages among the hills, and who cannot sometimes come to church, because the roads are miry, or because the snow lies deep on the ground, I shall give excellent pithy passages from the works of the great British Moralists, the names of which they hardly ever heard of.—For the recreation of those men who reflect deeply on the constitution of man, I shall from time to time present passages from the works of Newton and Bacon, the learned Encyclopædists, and other English luminaries of the present and preceding ages; so that their dignified knowledge may not remain any longer locked up in leather bindings, in presses, but be brought under the view of my readers, as they lie on their sofas in warm and comfortable rooms.—To Artizans I shall present instructive little paragraphs from the best writers on the various branches of their industry, and notices of new inventions in mechanics.—To the Naturalist I shall, in a similar manner, offer agreeable sketches illustrative of his interesting pursuits.—My short extracts, relative to Domestic and Cottage Economy, will, I doubt not, be received with approbation, from their general utility.—I shall give short analytical notices of and extracts from Books, pointing out which ought preferably to be bought. In this department I shall be altogether beyond the reach of being purchased by publishers, and shall only consult the benefit of the reader. I anxiously desire to remain on the most amicable terms with all my editorial friends;

but I promise them they shall find me a very DAVOUST in literary warfare. Like that eminent general of divison—who thought nothing of marching a body of thirty thousand men a dozen leagues before breakfast, and capturing his enemy before the men had time to powder their hair, or put the necessary daily whitening on the belts of their cartridge-boxes—I shall have a dozen fresh publications dispatched and gutted before they have time to draw on their red morocco slippers.—To the ladies and gentlemen of the "old school" I shall relate innumerable amusing traditional anecdotes, not one of which probably they ever heard before; and I shall tell them many curious particulars of old castles, and abbeys, and monks, and abbots, which, I dare say, will entertain them very agreeably in their easy chairs by their firesides. With the ladies of the "new school," and all my fair young countrywomen in their teens, I hope to be on agreeable terms, and I have no doubt but that in the end I shall turn out a great favourite. I will now tell them what I intend to do for them: I shall make a point of giving them every week, if I can find room, a nice amusing tale, either original, or selected from the best modern authors—no ordinary trash about Italian castles, and daggers, and ghosts in the blue chamber, and similar nonsense, but something really good. I will also inform them of a thousand useful little receipts and modes of housewifery, calculated to make them capital wives; and perhaps I may give them some new insight into the mysteries of sewing maps and footstools, and painting in water colours, and drawing with pencils or chalk, and of singing, and improving their taste in music.

I intend to do a great deal for Boys. I have long been of opinion that these "harmless little men" are an exceedingly ill-used people. I was once a boy myself, and I remember how thankful I was when any body explained things to me. I was many years the worst scholar in the whole school. I never learned anything, because no one would give me a reason for there being certain peculiarities in the construction of Latin words. It was ten years after I left school before I saw through the trick of learning this intricate tongue, which I found altogether consisted of paying the most minute attention to the two last letters in the words; often did I think that mankind had entered into a conspiracy to torment boys with Latin. My distaste of this language drove me from the perusal of every kind of books, and I was near turning out an ignorant blockhead. My father, who was an exceedingly intelligent man, at length saw what I wanted: it was instruction under an alluring, comprehensible form. He tried me first with Gulliver—not a trifling sixpenny Gulliver, which tells only about the little men the size of your finger, but one which tells also of the great tall men the height of a church steeple; and the men who were always apt to fall asleep, and had to be kept awake by flappers; and the men who always began to build their houses from the roof downwards; and of the horses who could speak and drink tea with each other, at one another's houses, and who had a sort of human beings to act as their servants. A relation of these wonderfully curious things opened up a new world to my awakened senses. Robinson Crusoe and the Pilgrim's Progress were soon similarly devoured, and I became a confirmed reader for ever after.

This is what I intend to do for boys: I know the kind of things they would like to read about, and a perusal of which would lead them to more abstruse and valuable studies. I shall give them lots of nice little stories, every one of which will be true, about travellers who went upon long and painful journeys in Asia and Africa, seeking for knowledge regarding the

produce and peculiarities of unknown countries; and how they travelled among the most sublime ruins of empires, of which history scarcely retains a recollection; or across spacious burning deserts and wildernesses, tenanted only by naked savage men, wild beasts of a ferocious character, and snakes of a most frightful size. Or I will describe to them the region in its present degraded condition, in which those miraculous events took place which are recorded in the books of the Old and New Testament; and of who were instrumental in writing these exceedingly ancient productions; and how long they remained unknown to mankind in their present shape; and of how that unfortunate country is now inhabited by an indolent race of men, who wear cambric napkins on their heads instead of hats, and shawls like women; and how they have no chairs in their houses, but sit cross-legged on the floor, like tailors, sipping coffee out of cups not much larger than a thimble, and smoking long pipes made out of the branches of cherry-trees. I have yet a great deal more things in store for boys. If they behave themselves, and learn their lessons at school, I shall tell them all about building rabbit-houses on scientific principles; and, perhaps (but their mothers and fathers are to hear nothing of it), I shall give them an insight into the art of legerdemain. I have yet many nice things in my mind which I am going to tell boys. I shall inform them about matters which their papa does not think of speaking to them about, because he is so busy; such as the meaning and uses of many institutions they will have to be members of when they become big; and, among other things, of how the people of this country, by their good sense and steadiness, have made little paper pictures pass for money in shops, and which are worth twenty round silver shillings with the king's head on them, or a whole capful of penny pieces. Or, as I know that boys are fond of voyages at sea, and like to hear about sailors who were wrecked by storms on desert islands, I will give them a number of stories of that description, of which they have at present no idea. I will also tell them of still more terrific adventures of seamen who have tried to sail their ships round the northern extremity of America, whose vessels were frozen in among large floating islands of ice, and who had a great difficulty in keeping themselves warm, as well as sustaining life, by eating seaweed, till the ices thawed, and their ships were permitted to return home. Finally, I shall give them accounts of men who were at one time poor little boys like themselves, but who, on paying a daily attention to their studies, and being always honest, and having a great desire to become eminent, and not be mere drudges all their days, gradually rose to be great statesmen, and generals, and members of learned professions, and distinguished authors, and to have fine houses and parks; and that at last they even came to be made kings or presidents of powerful nations.

WILLIAM CHAMBERS.

EDINBURGH, February 1, 1832.

ON THE FORMATION OF SCOTTISH SOCIETY.

THE necessary labours, and the frivolous pursuits of man, leave him little leisure to inquire into the early state of that system of society of which he happens to be a member; while few are tempted, from their ordinary course of reading, to search into records pregnant with the most instructive details of the former condition of their native country, or illustrative of the rise and progress of that remarkable organisation which has elevated Britain to the highest pitch of intellectual superiority. For instance, there are not many who can give an explicit account of how the people in the northern part of our island came to speak the generous language which they now employ; how different orders of society originated; or how or why families began to use surnames. Without a knowledge of circumstances of this interesting nature, no Scotsman can properly understand a variety of those institutions which he sees established around him. He will only know that those things had a beginning some time, but when that *some time* was, he cannot rightly tell; and so he will settle down in an ignorant and apathetic contentment, exceedingly prejudicial to his character as a person of intelligence. Before coming to a discussion on these ingenious arrangements, which rule the conduct of modern society, it would be best to explain, in a simple manner, some of those preliminary matters to which we allude; and by this procedure, we shall clear the way of several obstacles which interrupt our progress.

Prior to the tenth century, the greater part of Scotland was the residence of a number of different nations of men, who, though governed by distinct heads, owned the same Celtic original, tracing their descent from that great branch of mankind, which, in the most remote times, crossed the Hellespont, and over-spread the whole of Europe and its islands. Whether named Picts, Scots, or Celts, they all held communication in the Gaelic language, though varying in idiomatic expression. At the period to which we refer, there were few towns in Scotland; almost none of those castles whose remains we now see in the country; none of those abbeys whose picturesque ruins ornament many a rural scene; no feudal usages; no lords, no peers, no trade, and little civilisation. The kingdom lay a savage blank; kings, thanes, priests, and people, spoke the Celtic tongue, and, as

is supposed, wore the Highland garb. An astonishing revolution was, however, destined soon to take place, and to alter, by its influence, the whole system of human society.

The reign of Malcolm III. (or *Canmore*, from *can more*, a great head), which lasted from the year 1057 to 1093, has usually been ascribed as the era of the great revolution which I mention. But it is well understood by antiquaries, that the change began somewhat earlier, and lasted much later. Before the reign of Malcolm, the district called Lothian, which, in point of fact, included the shires of Linlithgow, Edinburgh, Haddington, Berwick, and part of Roxburgh, formed a large portion of the Saxon kingdom of Northumbria, and was, consequently, settled by an Anglo-Saxon people, whose tongue and whose usages were thus early settled in the division of country south of the Forth. About the year 1020, this large and fair portion of Scotland was added to the Scottish crown by Malcolm II.; and when Malcolm Canmore came to the throne, he found himself the first ruler of the whole of Scotland. The settlement of Anglo-Saxons in Lothian prepared the way for a far wider extension of their race over the country; and the troubles in England prior to, and consequent on, the Norman Conquest, produced a continued influx of foreigners into North Britain. The Conquest itself was, indeed, an immediate cause of a prodigious emigration of Anglo-Saxons into Scotland. It will be remembered that Edgar Ætheling, the unfortunate prince who was subdued by William of Normandy, fled with his family on the seizure of his country, and bent his way towards the continental territories of his ancestors. Luckily for Scotland, the ship which bore the dejected prince across the seas, was driven by a tempest into the Firth of Forth, where he landed, and was hospitably received by Malcolm, who resided at the time in Dunfermline. The Scottish monarch was already favourably known to Edgar and his family. The result is well known: Margaret, his sister, became the wife of Malcolm, and proved an inestimable blessing, not only to her royal spouse, but to the whole Scottish nation. She taught him the Saxon tongue, the arts of reading and writing, and several other accomplishments. In consequence of her settlement in Scotland, the country became the ready place of refuge to a vast number of Anglo-Saxon chiefs and their followers. It is not easy to discover the extent of change which this influence of a more civilised people produced on the Scotch at this particular period; for, after the demise of Margaret, a large body of her followers are said to have been chased out of the country by the indignant natives. Malcolm, it seems, had the good sense to give an asylum to the fugitives from the south; he, indeed, aided insurrections in England for the purpose; and during his incursions into Northumberland and Durham, carried away so many of the young men and women, that they were seen many years afterwards not only in every village, but in every house within his dominions. It may therefore be concluded, that such a large introduction of foreigners must have had a permanent influence on society, and could not be eradicated at any future period.

In the reign of Malcolm Canmore, there were not many settlements of Anglo-Saxon barons who left lines of descendants in the higher ranks. The only two which have been noticed were the Earls of Dunbar and of Lennox, both of whose houses have merged in subsequent times. We have thus to look to a period after the decease of Malcolm for the events which occurred to change the customs of the country. On investigating the remote records of history, it is ascertained that the successive reigns of Edgar, Alexander I., and David I.—embracing a period from 1098 to 1153—formed the interesting epoch in which the overthrow of Celtic usages took place; but that in that period, the benignant reign of David I. has the chief claim to be considered the most conducive to such an alteration.

David I., whose extreme piety has been well detailed in history, having been educated at the English court of Henry I., and married an English countess, was followed into North Britain by a thousand Anglo-Normans—that is, English gentlemen of Norman extraction, or perhaps of Anglo-Saxon and Norman lineage—to whom he distributed lands in all parts of the country, where they settled with their retainers, and built castles, churches, mills, and hamlets, for the convenience of themselves and their retainers. The feudal chiefs, who were thus introduced by David, seem to have soon remodelled the order of things previously existing. The barbarous civil code, if code it can be called, dropped in pieces; the greater proportion of those eminently judicious laws now governing the country were established; parliaments and sheriffdoms were organised; guilds and governments of burghs were instituted; the Celtic tongue very soon, and in a most surprising manner, was abandoned; the people in the towns which were built near the castles of the barons, gave it altogether up; speedily it was only spoken by serfs or *villeins*; not long after, they also gave it up, because they were compelled, of necessity, to learn the language of their masters; ultimately, it was forced to linger only in the wilds of Galloway, Carrick, and the Highlands; it was even gradually banished from thence, and in our own times, the only portion of the country which retains it, is the last-mentioned district, and the Western or Hebridean Isles. About the same epoch, there was also an infusion of a

Scandinavian Gothic race in Caithness and the northern islands, who helped to destroy the Celtic tongue, and to extirpate its usages. Thus, in nearly all directions, the naturalised Scotch, the real owners or tillers of the land, the descendants of the original Irish and Scottish tribes, or of the Romanised Britons, sunk, without striking a blow, before the powerful and intelligent domination of Germans, Normans, or Goths, and have left behind them in the Lowlands no farther traces of their presence than those conferred by the names of places, which are, almost without exception, of a Gaelic original, or by physical memorials of their places of devotion and sepulture. The most remarkable part of this singular overthrow was the circumstance of those Germans and Normans settling even in the heart of the Highlands, which, it is pretended, were *never* conquered, and these becoming the heads or chiefs of clans, have ever since been revered as the descendants of the most ancient aborigines. We shall soon have occasion to notice some of those foreign chieftains, whom the Highlanders have in this manner had imposed upon them.

Having now shown when and how this country lost the impress of its Celtic original, it will be a matter of agreeable recreation to go over a list of patrician and respectable Scottish families, who, in the way we have described, settled in the country. We consider it quite unnecessary, in a publication of this kind, to crowd the pages with authorities, but for the authenticity of the details, we may at once pledge ourselves. The first family which we may notice, was that of the *Morvilles*, who came from Burg in Cumberland, and acquired extensive possessions from David I. in Lauderdale, the Lothians, and Ayrshire. Hugh Morville, the first of his race in this country, became Constable of Scotland, an office which descended hereditarily through a long succession of illustrious heirs, both male and female. By Beatrice de Bello Campo, his wife, he acquired still greater possessions, and left a son to inherit his honours, as well as that of principal minister of William the Lion. This distinguished man built the Abbey of Dryburgh, and a great many churches. The Morvilles are frequently mentioned in Scottish history, and at one time they had extensive powers. They surrounded themselves with vassals, a number of whom were from England; and from the chief of these foreign servants there sprung not a few of our most respectable landed proprietors, especially in Cunningham, Haddingtonshire, and Tweeddale. In the latter, one of these gentlemen named *Edufr*, received lands near Peebles, in which arose a village taking from him the name of *Eddleston*. The family at length sunk, or lost its name, in Scotland, by the introduction of three female heirs, one of whom married De Quincy, Earl of Winchester; the second a son of the Earl of Albemarle; and the third, John Baliol, the lord of Bernard Castle, in Yorkshire, from whom sprung John Baliol, some time King of Scots, and a number of distinguished families in Galloway, where the descendants settled, and their families may still be found.—The *Riddels* came at the same time into Scotland, and there was not for many centuries a more respectable family. The first of the race was Gervase Riddel, who came from Ridal, in Yorkshire, and, under David, became one of the earliest sheriffs of Roxburghshire. From this district the family spread into Mid-Lothian, gave a name to a place now or lately called Cranston Ridel, near Dalkeith, and originated a great number of families of the name of Riddel in other parts of Scotland. The first of these Riddels also brought Anglo-Saxons with him as vassals, who contributed to swell the population of the country.—The *Corbets* were coeval with the Riddels, and were equally distinguished for the respectability of their rank and character. The first of the name was Robert Corbet, who came out of Shropshire, which was the original country of his race. He settled in Teviotdale, and seems to have been an opulent and liberal man. The family became conspicuous in the reign of William the Lion, and with their vassals helped considerably to Anglicise the country. Several of the name found their way into the north, and settled in Moray, where, perhaps, their descendants still remain. The main line of the family became extinct in the thirteenth century. Of the Riddels and Corbets, we shall have something remarkable to mention a little farther on.—The highly honourable and respectable family of the *Lindsays* were among the followers of David. Two brothers of the name of Walter de Lindsay and William de Lindsay, came out of Essex, from a place called Lindsay, and, attaching themselves to Earl David, before he ascended the throne, obtained from him, when he became king, extensive possessions in the Upper Ward of Lanarkshire, and Mid and East Lothian. One of their descendants, entitled David de Lindsay, settled in Fife, where he held lands under Ermengarde, the Queen of William the Lion, and originated a family of Lindsays, which has, we believe, ever since stood among the chief freeholders in the county. The Lindsays of Queen Mary's reign were descended from a descendant of one of the former-mentioned Lindsays, who obtained lands in Berwickshire. In modern times, we find families of the name of Lindsay over the whole of Scotland. Perhaps it is not generally known that the distinguished Northumbrian house of *Percy* sent a branch into this northern kingdom. Alan de Percy, like the Lindsays, attached himself to Earl David, and adhered to this beneficent

prince when he became king. With the alacrity and spirit of his race, he accompanied David to the celebrated battle of the Standard, in the year 1138. In return for his valuable services, he received the manors Oxenham and Heton, in Teviotdale. The line of family which Alan de Percy re-established, became munificent endowers of Melrose Abbey; but after sustaining an honourable name for three generations, the family became extinct for lack of heirs. The name of Percy is not common in Scotland, and any which possess it must be descended from the immigrant of modern times.—The *Somervilles* fall the next to be mentioned; but we must stop for the present

EMIGRATION.

It has been mentioned in our prospectus, that the furnishing of valuable and correct information on the subject of Emigration from Britain, shall, if possible, be a prominent object in the design of the present publication. The reason for this may be soon stated. The works of a respectable character, which profess to enlighten us on so momentous a topic, are generally so expensive, or otherwise so difficult to be obtained, that they seldom come within the reach of the humbler classes, who, it is evident, are those to whom information can only be of practical benefit. Under this impression, it becomes our willing office to present, as far as in our power, a variety of details on a point so important to the interests of a large mass of our readers. In looking about for some branch on which to begin with, we do not see any so likely to yield satisfaction as that relative to emigration to Canada and the United States of America; and of these countries we do not perceive any account which contains so much good, sound information, especially of a recent date, as an article "On the Agricultural Condition of Canada and part of the United States," drawn up by Adam Fergusson of Woodhill, just published, among other papers, under the auspices of the Highland Society. The directors of this beneficial institution having been apprised by Mr Fergusson of his intention to visit these places, it appeared to them a favourable opportunity of obtaining such information as might prove beneficial to rural economy, and the useful arts at home. The result has proved the correctness of those views. Mr Fergusson visited America in the course of the last year, 1831, and has now presented a statement which cannot be too highly prized. He gives us an outline of his excursion through the provinces of Lower and Upper Canada, and his visit to the States, the author every where giving a distinct view of the state and appearance of the country, the nature of soils, the crops which the lands produce, the price and rent of farms, and the market value of all kinds of stock. The author never *palavers* on any subject, but comes at once to the point; and that is what gives his paper its greatest value. No sort of abridgement is thus necessary in offering our readers a specimen of the production, and so we hurry to let the traveller speak for himself.

"To those ignorant of the geographical position, there is something in the term *Lower*, strongly indicative of a superiority in climate, which is by no means borne out by actual circumstances. Winter, in the Lower Province, wears a more severe and protracted form than it does on the great table-land above. Many decisive facts in confirmation of this might be adduced. I shall only mention that wheat cannot here withstand the severity of winter, requiring to be sown in spring, and occasioning thereby both loss and inconvenience to the farmer in wet and late seasons; while quails, or Virginian partridges, it may be observed, which abound in the Upper, are totally unknown in the Lower Province.

The soil is generally a fertile clay, which has hardly been yet brought, in any instance, to the test of what it may produce. It is generally occupied in small possessions, which continue, with the exception of some large seignories and church-lands, to fritter more and more away, from the absence of a check in the law of primogeniture, and a want of enterprise in the people, which might lead them to counteract this effect, by entering on new land. The population is chiefly French, and the religion Roman Catholic. The *habitants* are industrious, frugal, and contented; but their condition, to say the least, is almost stationary, and the habits or practices of their fathers are far too scrupulously revered.

I had an opportunity of seeing and conversing with several British emigrants, who either occupy or possess farms in Lower Canada, and the uniform conclusion, to which all of them came, was an advice to look at the Upper Province before I formed an opinion upon the eligibility of a settlement. I am quite aware that several of these individuals are prospering, in a measure which might possibly be curtailed, if too many farmers of a like stamp should become located beside them; but I am equally satisfied that no such jealousy influenced the advice I received, and that the established conviction of all who are experimentally acquainted with Canada, is in favour of the Upper Province, as a settlement for British agriculturists. Those emigrants who have obtained land near Quebec or Montreal, and who are industrious and active, profit, of course, very handsomely by the vicinity of these cities.

Dairy produce brings in excellent returns, and every thing finds a market; and although mere locality cannot avail so much as formerly, when steam

navigation was unknown, still great advantages remain to the occupier of land near large towns. It is to be remarked, too, that the greater supply of farm produce, occasioned by the introduction of steam-boats, has materially increased the consumption, and has thereby compensated to the farmer the fall in price which necessarily followed. Fresh butter, which sold in 1817 for 1s. 6d. per pound in Montreal, may now be had for 6d. In summer it is a perishable article, and must be sold when it comes to market. But hay, straw, potatoes, &c., and the very soil itself, are becoming, in the vicinity of Montreal, what an Angus farmer termed to me, 'mischievously dear;' and those who are in possession of farms in that vicinity will reap an abundant harvest. My Angus friend, who seemed to be in the enjoyment of very easy circumstances, affords a proof, among hundreds, of what an industrious and steady man may do for himself in Canada. He came out in 1817, was wrecked in the Gulf of St Lawrence, suffered many hardships, and finally landed at Montreal, devoid of every resource, save his own hands and good spirits. He soon found employment, and in due time took a lease of a farm, which he finds to succeed extremely well. His wheat and potatoes, he says, are excellent; oats, inferior. He cultivates green crops, taking mangel wurzel instead of turnips, which suffer from the fly. He uses horses in preference to oxen; he has iron ploughs, and follows what he called a sort of rotation; 1st, Wheat; 2d, Green crop; 3d, Clover; 4th, Timothy for hay; and, 5th, Pasture. Several farms are at this time to let in this quarter. The rent expected is 10s. or 12s. per acre.

The Canadian farmers pursue the old Scottish practice of infield and outfield, taking crop after crop of grain from their fields, until nothing but weeds remain, and looking to Nature for that renovation which their own industry ought to have effected.

It may appear almost incredible, but I was assured of the fact, that it was by no means unusual, as winter occupation among the *habitants*, to drive out dung from their farm-yards, and deposit it upon the glassy surface of the St Lawrence, there to await the breaking up in spring, as a riddance from what they consider a worthless incumbrance.

On tracing a route upwards from Montreal, the eye of an emigrant is speedily arrested by the junction of the Ottawas, or Grand River, falling into the St Lawrence. I did not visit the settlements of this district, and do not therefore speak of them from personal observation; but they are well known to be valuable, extensive, and increasing. The Ottawas has of late years attracted the notice of government, as a safe route for troops and stores to the Upper Province, in the event of war with the United States. In surveying its banks, and applying its course to this purpose, extensive tracts of fine land have been located, and several very promising settlements have been established. Of these, I may notice Perth, Richmond, and Lanark, the two former chiefly composed of retired officers and reduced soldiers; the latter, of families from the manufacturing districts in the west of Scotland, who came out in 1820, and all, I believe, as communities, doing well. All of these were assisted and fostered by government. A military road communicates between Ottawas and Kingston, upon Lake Ontario, a distance of 240 miles. The Rideau Canal passes through a part of the country between this line of road and the St Lawrence.

The soil of this part of Canada is good; but the country is flat, the lakes shallow, and the streams frequently sluggish, which must be necessarily accompanied, for a time, with fever and ague to a greater extent than more airy and better watered situations present. There can be no doubt, however, that the settlements already formed, and to be formed in this quarter, will prosper. Government has done much for them by public works, which can scarce fail to benefit the country, whether they do or do not effect the objects for which they were planned; and the steam communication upon the Ottawas with Montreal is already in operation.

Returning to the St Lawrence, we enter the Upper Province, the Ottawas here forming the boundary line. As we ascend the river, we find numerous settlers, and thousands of acres well adapted for the farmer. One of the first settlements we meet with is the Glen-garry district, an extensive tract of good land, enjoying the advantages of water carriage. The language, the customs, the native courage of their Celtic sires, still distinguish the clan, though at the same time, we are afraid, accompanied by some of those less profitable traits which stamp the Highlander as more at home in wielding the claymore, or extracting mountain dew, than in guiding the ploughshare to slow but certain results. The farms are but indifferently improved, considering the advantages they have enjoyed; and much valuable time is expended in the depths of the forest, in a demi-savage life, cutting and preparing timber for the lumber merchant, which, if steadily devoted to the cultivation of the land, would certainly be attended with infinitely greater benefit, both in a physical and moral point of view.

Very conflicting opinions exist in Canada regarding the lumber-trade, and the subject was frequently discussed at this period, from the late proposal of ministers to lower the duties upon Baltic timber. It is certain that a large circulation is occasioned by the trade, perhaps a million sterling, in one way or another, and that it employs, during winter, many who may gain

perhaps L.20 for their winter labour when nothing else could be done.

To go minutely into the statistics of even the banks of the river, would far exceed the limits to which I must necessarily restrict myself. Suffice it to say, that a constant succession of eligible situations present themselves for estates and farms. I was much pleased with the Matilda district, and consider it capable of great improvement. The soil is a fine mellow sandy loam, sometimes perhaps rather light, but admirably adapted for turnip husbandry and fine-woolled sheep, with numerous beautiful situations for a residence, the noble St Lawrence ever forming a prominent feature, its surface varied by lovely wooded islands, similar to those we so justly admire on many of our British lakes. In approaching Kingston, or the east end of Lake Ontario, the river Guananoque falls into the St Lawrence, and, at its mouth, is the establishment of Messrs M'Donell, two brothers who came about eight years ago to the colony, and who, by steady enterprise, without original capital, have realised considerable wealth, while, along with it, they have secured the respect and esteem of all who know them. They have here, what is called in America, a valuable water privilege or fall, and have erected flour and saw-mills to a large extent. Last season they sent down to Montreal 24,000 barrels of flour; and a friend of mine who was their agent, informed me that one of the brothers having resolved upon becoming their own agent in Montreal, it would be a loss of some hundreds a-year to his house in commission. They have a very clever cooperage worked by water, similar to the steam cooperage at Glasgow, and the articles turned out are uncommonly reasonable, substantial, and neat. I regretted much not having it in my power to form an acquaintance with these spirited colonists, more especially as they farm likewise to a large extent. The farm at Guananoque extends to 1200 acres, and the mansion-house and barns are commodious and handsome.

Having received very encouraging accounts at Kingston, of the country along the Bay of Quinty, a deep inlet of Lake Ontario, formed by a peninsula called Prince Edward's Island, I made an excursion into that district. The scenery was pleasing, in many places very fine; and settlements are forming on every hand. The soil is partly clay, partly loam and sand, sufficiently rich to yield fifteen crops of good wheat, with impunity, in a period of twenty years. Granite, limestone, and schistus, or claystone, are successively met with. Wherever a stream or creek of any importance falls into the lake, there we find a mill-seat and a village growing up, the embryo, in many cases, of considerable towns.

To the patriot or philanthropist, it is highly gratifying to remark, how the wants of the farmer and the interests of the trader or mechanic co-operate in the rapid progress of general improvement and civilisation. Holywell, Sophiaburgh, and Belville, are all thriving villages of this description; and many individuals are to be met with in each, who, from the humble situation of merchants' clerks, &c. are rapidly acquiring independence. The last is the county town of Hastings, which has already three churches, a court-house, and projected jail; a valuable mill-power and fine situation for houses; the high road from York to Kingston passes through it, and, altogether, it seems destined to become a place of some note. I was really astonished at the frequent calls which the steam-boat made for produce, and, ere we reached Kingston, our deck was absolutely heaped with flour barrels."—*Agricultural Journal*.—To be continued.

LADY JEAN.

The Verl o' Wigton had three daughters,
Oh, braw wale! they were bonnie!
The youngest o' them and the bonniest too,
Has fallen in love wi' Richie Storie.—*Old Ballad*.

The Earl of Wigton, whose name figures in Scottish annals of the reign of Charles II., had three daughters, named Lady Frances, Lady Grizel, and Lady Jean—the last being by several years the youngest, and by many degrees the most beautiful. All the three usually resided with their mother at the chief seat of the family, Cumbernauld House, in Stirlingshire; but the two eldest were occasionally permitted to attend their father at Edinburgh, in order that they might have some chance of obtaining lovers at the court held there by the Duke of Lauderdale, while Lady Jean was kept constantly at home, and debarred from the society of the capital, lest her superior beauty might interfere with, and foil, the attractions of her sisters, who, according to the notion of that age, had a sort of right of primogeniture in matrimony, as well as in what was called *heirship*.

It may be easily imagined, that, while the two marriageable ladies were enjoying all the delights of a third flat in one of the *closets* of the Canongate, spending their days in seeing beaux, and their nights in dreaming of them, Lady Jean led no pleasant life amidst the remote and solitary splendours of Cumbernauld, where her chief employment was the disagreeable one of attending her mother, a very infirm and querulous old dame, much given (it was said) to strong waters. At the period when our tale opens, Lady Jean's charms, though never seen in the capital, had begun to make some noise there; and the curiosity excited respecting them amongst the juvenile party of the vice-regal court, had induced Lord Wigton to confine her ladyship even more strictly than

heretofore, lest perchance some gallant might make a pilgrimage to his country seat, in order to behold her, and, from less to more, induce her to quit her retirement, in such a way as would effectually discomfit his schemes for the pre-advancement of his elder daughters. He had been at pains to send an express to Cumbernauld, ordering Lady Jean to be confined to the precincts of the house and the terrace-garden, and to be closely attended in all her movements by a trusty domestic. The consequence was, that the young lady complained most piteously to her deaf old lady-mother of the tedium and listlessness of her life, and wished with all her heart that she was as ugly, old, and happy as her sisters.

Lord Wigton was not insensible to the cruelty of his policy, however well he might be convinced of its advantage and necessity; he loved his youngest daughter more than the rest; and it was only in obedience to what he conceived to be the commands of duty, that he subjected her to the restraint. His lordship, therefore, felt anxious to alleviate in some measure the *désagrémens* of her solitary confinement; and knowing her to be fond of music, he had sent to her by the last messenger, a theorbó lute, with which he thought she would be able to amuse herself in a way very much to her mind—not considering that, as she could not play upon the instrument, it would be little better to her than an unmeaning toy. By the return of his messenger, he received a letter from Lady Jean, thanking him for the theorbó, but making him aware of his oversight, and begging him to send some person who could teach her to play.

The earl, whose acquirements in the philosophy of politics had never been questioned, felt ashamed of having committed such a solecism in so trivial a matter; and, like all men anxious to repair or conceal an error in judgment, immediately ran into another of ten times greater consequence and magnitude;—he gratified his daughter in her wish.

The gentry of Scotland were at that time in the custom of occasionally employing a species of servants, whose accomplishments and duties would now appear of a very anomalous character, though at that time naturally arising from the peculiar situation of this country, in respect to its southern neighbour. They were, in general, humble men who had travelled a good deal, and acquired many foreign accomplishments; who, returning to their native country after an absence of a few years, usually entered into the service of the higher class of families, partly as ordinary livery-men, and partly with the purpose of instructing the youth of both sexes, as they grew up and required such exercises, in dancing, music, writing, &c., besides a vast variety of other arts, comprehended in the general phrase of *breeding*. Though these men received much higher wages, and were a thousand times more unmanageable than common serving men, they served a good purpose in those days, when young people had scarcely any other opportunities of acquiring the ornamental branches of education, except by going abroad. It so happened, that not many days after Lord Wigton received his daughter's letter, he was applied to for employment by one of these useful personages, a tall and handsome youth, apparently five-and-twenty, with dark Italian-looking features, a slight moustache, and as much foreign peculiarity in his dress, as indicated that he was just returned from his travels. After putting a few questions, his lordship discovered that the youth was possessed of many agreeable accomplishments; was, in particular, perfectly well qualified to teach the theorbó, and had no objection to entering the service of a young lady of quality—only, with the proviso that he was to be spared the disgrace of a livery. Lord Wigton then made no scruple in engaging him for a certain period; and next day saw the youth on the way to Cumbernauld, with a letter from his lordship to Lady Jean, setting forth all his good qualities, and containing among other endearing expressions, a hope that she would both benefit by his instructions, and be in the meantime content on their account with her present residence.

Any occurrence at Cumbernauld, of higher import than the breaking of a needle in embroidering, or the miscarriage of a brewing of currant wine, would have been quite an incident in the eyes of Lady Jean; and even to have given alms at the castle-gate to an extraordinary beggar, or to see so much as a stranger in the candle, might have supplied her with amusement infinite, and speculation boundless. What, then, must have been her delight, when the goodly and youthful figure of Richard Storie alighted one dull summer afternoon at the gate, and when the credentials he presented disclosed to her the agreeable purpose of his mission! Her joy knew no bounds; nor did she know in what terms to welcome the stranger: she ran from one end of the house to the other, up stairs and down stairs, in search of she knew not what; and finally, in her transports, she shook her mother out of a drunken slumber, which the old lady was enjoying as usual in her large chair in the parlour.

Master Richard, as he was commonly designated, soon found himself comfortably established in the good graces of the whole household of Cumbernauld, and not less so in the particular favour of his young mistress. Even the sour old lady of the large chair was pleased with his handsome appearance, and was occasionally seen to give a preternatural nod and smile at some of his musical exhibitions, as much as to say she knew when he performed well, and was willing to en-

courage humble merit. As for Lady Jean, whose disposition was equally lively and generous, she could not express, in sufficiently warm terms, her admiration of his performances, or the delight she experienced from them. Nor was she ever content without having Master Richard in her presence, either to play himself, or to teach her the enchanting art. She was a most apt scholar—so apt, that in a few days she was able to accompany him with the theorbó and voice, while he played upon an ancient harpsichord belonging to the old lady, which he had rescued from a lumber-room, and been at some pains to repair. The exclusive preference thus given to music, for the time threw his other accomplishments into the shade, while it, moreover, occasioned his more constant presence in the apartments of the ladies than he would have been otherwise entitled to. The consequence was, that in a short time he almost ceased to be looked upon as a servant, and began gradually to assume the more interesting character of a friend and equal.

It was Lady Jean's practice to take a walk prescribed by her father, every day in the garden, on which occasions the countess conceived herself as acting up to the letter of her husband's commands, when she ordered Master Richard to attend his pupil. This arrangement was exceedingly agreeable to Lady Jean, as they sometimes took out the theorbó, and added music to the other pleasures of the walk. Another out-of-doors amusement, in which music formed a chief part, was suggested to them by the appropriate frontispiece of a book of instruction for the theorbó, which Master Richard had brought with him from Edinburgh. This engraving represented a beautiful young shepherdess, dressed in the fashionable costume of that period—a stupendous tower of hair hung round with diamonds, and a voluminous silk gown with a jewel-adorned stomacher, a theorbó in her arms and a crook by her side—sitting on a flowery bank under a tree, with sheep planted at regular distances around her. At a little distance appeared a shepherd with dressed hair, long-skirted coat, and silk stockings, who seemed to survey his mistress with a languishing air of admiration, that appeared singularly ridiculous as contrasted with the coquettish and contemptuous aspect of the lady. The plate referred to a particular song in a book, entitled "A Dialogue betwixt Strephon and Lydia, or the proud Shepherdess's Courtship," the music of which was exceedingly beautiful, while the verses were the tamest and most affected trash imaginable. It occurred to Lady Jean's lively fancy, that if she and her teacher were to personify the shepherdess and shepherd, and thus, as it were, to transform the song to a sort of opera, making the terrace-garden the scene, not a little amusement might be added to the pleasure she experienced from the mere music alone. This fancy was easily reduced to execution; for, by seating herself under a tree, in her ordinary dress, with the horticultural implement called a rake by her side, she looked the very Lydia of the copperplate; while Richard, standing at his customary respectful distance, with his handsome person, and somewhat foreign apparel, was a sufficiently good representation of Strephon. After arranging themselves thus, Master Richard opened the drama by addressing Lady Jean in the first verse of the song, which contained, besides some description of sunrise, a comparison between the beauties of nature at that delightful period, and the charms of Lydia, the superiority being of course awarded to the latter. Lady Jean, with the help of the theorbó, replied to this in a very disdainful style, affecting to hold the compliments of lovers very cheap, and asseverating that she had no regard for any being on earth besides her father and mother, and no care but for these dear innocent sheep (here she looked kindly aside upon a neighbouring bed of cabbages), which they had entrusted to her charge. Other verses of similar nonsense succeeded, during which the representative of the fair Lydia could not help feeling rather more emotion at hearing the ardent addresses of Strephon than was strictly consistent with her part. At the last it was her duty to rise and walk softly away from her swain, declaring herself utterly insensible to both his praises and his passion, and her resolution never again to see or speak to him. This she did in admirable style, though perhaps rather with the dignified gait and sweeping majesty of tragedy-queen, than with anything like the pettish or sullen strut of a disdainful rustic; meanwhile, Strephon was supposed to be left inconsolable. Her ladyship continued to support her assumed character for a few yards, till a turn of the walk concealed her from Master Richard; when, resuming her natural manner, she turned back, with sparkling eyes, in order to ask his opinion of her performances; and it was with some confusion, and no little surprise, that on bursting again into his sight, she discovered that Richard had not yet thrown off his character. He was standing still, as she had left him, fixed immovably upon the spot in an attitude expressive of sorrow for her departure, and bending forwards as if imploring her return. It was the expression of his face that astonished her most; for it was not at all an expression appropriate to either his own character or to that which he had assumed. It was an expression of earnest and impassioned admiration; his whole soul seemed thrown into his face, which was directed towards her, or rather the place where she had disappeared; and his eyes were projected in the same direction, with such a look as that perhaps of an enraptured saint of old

at the moment when a divinity parted from his presence. This lasted, however, but for a moment; for scarcely had that minute space of time elapsed, before Richard, startled from his reverie by Lady Jean's sudden return, dismissed from his face all trace of any extraordinary expression, and stood before her (endeavouring to appear) just what he was, her ladyship's respectful servant and teacher. Nevertheless, this transformation did not take place so quickly as to prevent her ladyship from observing the present expression, nor was it accomplished with such address as to leave her room for passing it over as unobserved. She was surprised—she hesitated—she seemed, in spite of herself, conscious of something awkward—and finally she blushed slightly. Richard caught the contagion of her confusion in a double degree; and Lady Jean again became more confused, on observing that he was aware of her confusion. Richard was the first to recover himself and speak. He made some remarks upon her singing and her acting—not, however, upon her admirable performance of the latter part of the drama; this encouraged her also to speak, and both soon became somewhat composed. Shortly afterwards they returned to the house; but from that moment a chain of the most delicate, yet indissoluble sympathies began to connect the hearts of these youthful beings, so alike in all natural qualities, and so dissimilar in every extraneous thing which the world is accustomed to value.

After this interview there took place a slight estrangement between Master Richard and Lady Jean, that lasted a few days, during which they had much less of both conversation and music than for some time before. Both observed this circumstance; but each ascribed it to accident, while it was in reality occasioned by mutual reserve. Master Richard was afraid that Lady Jean might be offended were he to propose anything like a repetition of the garden drama; and Lady Jean, on her part, could not, consistently with the rules of maidenly modesty, utter even a hint at such a thing, however she might secretly wish or long for it. The very consciousness, reciprocally felt, of having something on their minds, of which neither durst speak, was sufficient to produce the said reserve, though the emotions of "the tender passion" had not come in, as they did, for a large share of the cause.

At length, however, this reserve was so far softened down, that they began to resume their former practice of walking together in the garden; but though the theorbó continued to make one of the party, no more operatic performances took place. Nevertheless, the mutual affection which had taken root in their hearts experienced on this account no abatement, but, on the contrary, continued to increase. As for Master Richard, it was no wonder that he should be deeply smitten with the charms of his mistress; for ever as he stole a long, furtive glance at her graceful form, he thought he had never seen, in Spain or in Italy, any such specimens of female loveliness; and (if we may let the reader so far into the secret) he had indeed come to Cumbernauld with the very purpose of falling in love. Different causes had operated upon Lady Jean. Richard being the first love-worthy object she had seen since the period when the female heart becomes most susceptible—the admiration with which she knew he beheld her—his musical accomplishments, which had tended so much to her gratification—all conspired to render him precious in her sight. In the words of a beautiful modern ballad, "all impulses of soul and sense had thrilled" her gentle and guileless heart—

—hopes, and fears that kindled hopes,
An undistinguishable throng,
And gentle wishes, long subdued,
Subdued and cherished long,

had exercised their tender and delightful influence over her; like a flower thrown upon one of the streams of her own native land, whose course was through the beauties, the splendours, and the terrors of nature, she was borne away in a dream, the magic scenery of which was alternately pleasing, fearful, and glorious, and from which she could no more wake, than could the flower restrain its course on the gliding waters. The habit of contemplating her lover every day, and that in the dignified character of an instructor, gradually blinded her in a great measure to his humbler quality, and to the probable sentiments of her father and the world upon the subject of her passion. If, by any chance, such a consideration was forced upon her notice, and she found occasion to tremble lest the sentiments in which she was so luxuriously indulging, should end in disgrace and disaster, she soon quieted her fears, by reverting to an idea which had lately occurred to her—namely, that Richard was not what he seemed. She had heard and read of love assuming strange disguises. A Lord Belhaven, in the immediately preceding period of the civil war, had taken refuge from the fury of Cromwell in the service of an English nobleman, whose daughter's heart he won under the humble disguise of a gardener, and whom, on the recurrence of better times, he carried home to Scotland as his lady. This story was then quite popular, and at least one of the parties still survived to attest its truth. But even in nursery tales Lady Jean could find examples which justified her own passion. The vilest animals, she knew, on finding some beautiful dame, who was so disinterested as to fall in love with them, usually turned out to be the most beautiful princes that ever were seen, and invariably married and made happy

the ladies whose affection had restored them to their natural form and just inheritance. Who knows, she thought, but Richard may some day, in a transport of passion, throw open his coat, exhibit the star of nobility glittering on his breast, and ask me to become a countess!

Such are the excuses which love suggests to reason, and which the reason of lovers easily accepts; while those who are neither youthful nor in love wonder at the hallucination of their impassioned juniors. Experience soon teaches us that this world is not one of romance, and that few incidents in life ever occur out of the ordinary way. But before we acquire this experience by actual observation, we, all of us, regard things in a very different light. The truth seems to be, that, in the eyes of youth, "the days of chivalry" do not appear to be "gone;" our ideas are then contemplative, or upon a par with the early romantic ages of the world; and it is only by mingling with mature men, and looking at things as they are, that we at length advance towards, and ultimately settle down in, the *real era* of our existence. Was there ever yet youth who did not feel some chivalrous impulses—some thirst for more glorious scenes than those around him—some aspirations after lofty passion and supreme excellence—or who did not cherish some pure first-love, that could not prudentially be gratified?

The greater part of the rest of the summer passed away before the lovers came to an *eclaircissement*; and such, indeed, was their mutual reserve upon the subject, that, had it not been for the occurrence of a singular and deciding circumstance, there appeared little probability of this ever otherwise taking place. The Earl of Home, a gay and somewhat foolish young nobleman, one morning after attending a convivial party where the charms of Lady Jean Fleming formed the principal topic of discourse, left Edinburgh, and took the way to Cumbernauld, on the very pilgrimage, and with the very purpose, which Lord Wigton had before anticipated. Resolved, first to see, then to love, and, lastly, to run away with, the young lady, his lordship skulked about for a few days, and at last had the pleasure of seeing the hidden beauty over the garden-wall, as she was walking with Master Richard. He thought he had never seen any lady who could be at all compared to Lady Jean, and, as a matter of course, resolved to make her his own, and surprise all his companions at Edinburgh with his success and her beauty. He watched again next day, and happening to meet Master Richard out of the bounds of Cumbernauld policy, accosted him, with the intention of securing his services in making his way towards Lady Jean. After a few words of course, he proposed the subject to Richard, and offered a considerable bribe, to induce him to work for his interest. Richard at first rejected the offer, but immediately after, on bethinking himself, saw fit to accept it. He was to mention his lordship's purpose to Lady Jean, and to prepare the way for a private interview with her. On the afternoon of the succeeding day, he was to meet Lord Home at the same place, and tell him how Lady Jean had received his proposals. With this they parted—Richard to muse on this unexpected circumstance, which he saw might blast all his hopes, unless he should resolve upon prompt and active measures, and the Earl of Home to enjoy himself at the humble inn of the village of Cumbernauld, where he had for the last few days enacted the character of "the daft lad frae Edinburgh, that seemed to ha'e mair siller than sense."

On the morning of the tenth day after Master Richard's first interview with Lord Home, that faithful serving-man found himself jogging swiftly along the road to Edinburgh, mounted on a stout nag, with the fair Lady Jean seated comfortably on a pillion behind him. It was a fine morning in autumn, and the road had a peculiarly gay appearance from the multitude of country people, mounted and dismounted, who seemed also hastening towards the capital. Master Richard, upon inquiry, discovered that it was the *market-day*, a circumstance which seemed favourable to his design, by the additional assurance it gave him of not being recognised among the extraordinary number of strangers who might be expected to crowd the city on such an occasion. The lovers approached the city by the west, and the first street they entered was the suburban one called Portsburgh, which leads towards the great market-place of Edinburgh. Here Richard, impatient as he was, found himself obliged, like many other rustic cavaliers, to reduce the pace of his horse to a walk, on account of the narrowness and crowded state of the street. This he felt the more disagreeable, as it subjected him and his interesting companion to the close and leisurely scrutiny of the inhabitants. Both had endeavoured to disguise every thing remarkable in their appearance, so far as dress and demeanour could be disguised; yet as Lady Jean could not conceal her extraordinary beauty, and Richard had not found it possible to part with a slight and dearly beloved moustache, it naturally followed that they were honoured with a good deal of staring. Many an urchin upon the street threw up his arms as they passed along, exclaiming, "Oh! the black-bearded man!" or, "Oh! the bonnie leddie!"—the men all admired Lady Jean, the women Master Richard—and many an old shoemaker ogled them earnestly over his half-door, with his spectacles pushed up above his dingy cowl. The lovers, who had thus to run a sort of gauntlet of admiration and remark, were glad when

they reached an inn, which Richard, who was slightly acquainted with the town, knew to be a proper place for the performance of a *half-merk marriage*. They alighted, and were civilly received by an obsequious landlady, who conducted them into an apartment at the back of the house. There Lady Jean was for a short time left to make some arrangements about her dress, while Richard disclosed to the landlady in another room the purpose upon which he was come to her house, and consulted her about procuring a clergyman. The dame of the house, to whom a clandestine marriage was the merest matter of course, showed the utmost willingness to facilitate the design of her guests, and said that she believed a clerical official might be procured in a few minutes, provided that neither had any scruples of conscience, as "most part of fouk frae the west had," in accepting the services of an Episcopal clergyman. The lover assured her that, so far from having any objection to "a government minister," for so they were sometimes termed, he would prefer such to any other, as both he and his bride belonged to that persuasion. The landlady heard this declaration with complacency, which showed that she loved her guests the better for it, and told Richard that, if he pleased, she would immediately introduce to him the Dean of St Giles, who, honest man, was just now taking his *meridian* in the little back garret parlour, along with his friend and gossip, Bowed Andrew, the waiter of the west port. To this Richard joyfully assented, and speedily he and Lady Jean were joined in their room by the said Dean—a squat little gentleman, with a drunken but important-looking face, and an air of consequentiality even in his stagger, that was partly imposing and partly ridiculous. He addressed his clients with a patronising simper, of which the effect was grievously disconcerted by an unlucky hiccup, and in a speech which might have had the intended tone of paternal and reverend authority, had it not been smattered and degraded into shreds by the crapulous insufficiency of his tongue. Richard cut short his ill-sustained attempts at dignity, by requesting him to partake of some liquor. His reverence almost leaped at the proffered jug, which contained ale. He first took a tasting, then a sip—shaking his head between—next a small draught, with a still more convulsion-like shake of the head; and, lastly, he took a hearty and persevering swill, from the effects of which his lungs did not recover for at least twenty respirations. The impatient lover then begged him to proceed with the ceremony; which he forthwith commenced in presence of the landlady and the above-mentioned Bowed Andrew; and in a few minutes Richard and Lady Jean were united in the holy bands of matrimony.—*To be concluded in our next.*

BIOGRAPHIC SKETCHES.

DR ADAM.

PERHAPS no country in the world, in proportion to its size, has produced so many eminent men, who have risen from the humble ranks of life, as Scotland; and no species of reading with which we are acquainted can yield such striking instances of the value of honest perseverance, under the most adverse circumstances, as the biography of the individuals who have so distinguished themselves. A most instructive lesson of this nature is afforded us in the life of the late Dr Adam, at one time rector of the High School of Edinburgh, and the author of a number of meritorious classic works, well known to every young man who attends our schools and colleges.

Alexander Adam, LL.D., was born at the hamlet of Coates of Burgie, in the parish of Rafford, and county of Moray, about the month of June 1741. His father, John Adam, rented one of those small farms which were formerly so common in the north of Scotland. In his earlier years, like many children of his own class, and even of a class higher removed above poverty, he occasionally tended his father's cattle. Being destined by his parents, poor as they were, for a learned profession, he was kept at the parish school till he was thought fit to come forward as an exhibitor, or, as it is called in Scotland, a bursar, at the University of Aberdeen. He made this attempt, but failed, from the alleged inferiority of his acquirements, and was requested by the judges to go back and study for another year at school. This incident did not mortify the young student, but only stimulated him to fresh exertions. He was prevented, however, from renewing his attempts at Aberdeen, by the representations of the Rev. Mr Watson, a minister at Edinburgh, and a relation of his mother, who induced him to try his fortune in the metropolis. He removed thither early in the year 1758, but, it appears, without any assured means of supporting himself during the progress of his studies. For a considerable time while attending the classes at the college, the only means of subsistence he enjoyed consisted of the small sum of one guinea per quarter, which he derived from Mr Allan Macconochie (afterwards Lord Meadowbank), for assisting him in the capacity of a tutor. The details of his system of life at this period, as given by his biographer Mr Henderson, are painfully interesting. "He lodged in a small room at Restalrig, in the north-eastern suburbs; and for this accommodation he paid fourpence a-week. All his meals, except dinner, uniformly consisted of oatmeal made into porridge, together with small beer, of which he only allowed himself half a bottle at a time. When he wished to dine, he purchased a penny loaf at the

nearest baker's shop: and if the day was fair, he would dispatch his meal in a walk to the Meadows or Hope Park, which is adjoining to the southern part of the city; but if the weather was foul, he had recourse to some long and lonely stair, which he would climb, eating his dinner at every step. By this means all expense for cookery was avoided, and he wasted neither coal nor candles; for when he was chill, he used to run till his blood began to glow, and his evening studies were always prosecuted under the roof of some one or other of his companions." There are many instances, we believe, among Scottish students, of the most rigid self-denial, crowned at length by splendid success; but there is certainly no case known in which the self-denial was so chastened, and the triumph so grand, as that of Dr Adam. Ere he had yet reached his twenty-first year, he was employed as a teacher in George Watson's Hospital at Edinburgh, an institution designed for the support and education of a certain number of boys. In 1761, when he was exactly twenty, he stood a trial for the situation of head teacher in this establishment, and was successful. In this place he is said to have continued about three years; during which period, besides discharging the duties of his office, he was anxiously engaged in cultivating an intimacy with the classics—reading, with great care, and in a critical manner, the works of Herodotus, Thucydides, Xenophon, Cicero, and Livy. At the same time he began to make a collection of books connected with the studies which he afterwards prosecuted with so much success. His views were now directed towards the church, and it is said he was on the eve of being licensed as a preacher of the gospel, when suddenly a prospect opened before him of becoming assistant, with the prospect of being eventually the successor, of Mr Matheson, rector of the High School. It would appear that his pretensions were fortified on this occasion by the influence of Mr Kincaid, Provost of Edinburgh, whose son he had for some time attended as tutor. It was not till 1771 that the increased infirmities of Mr Matheson threw the whole of this charge into the hands of Mr Adam; the retired rector was then permitted to draw the whole of the salary given by the town (about L.30), besides L.20 given by Mr Adam out of the school fees, the remainder furnishing a scanty provision for the man who performed the duty.

The time when Adam assumed this respectable office was very fortunate. Every department of knowledge in Scotland was at this period adorned by higher names than had ever before graced it; and hence the office of master in the principal elementary school of the country presented to a man of superior qualifications a fair opportunity of distinguishing himself. This opportunity was not lost upon Mr Adam. He devoted himself, with singular assiduity, to his laborious duties; and, under his auspices, the school gradually increased in numbers and reputation. Soon after his appointment, he began to compose a series of works adapted to facilitate the study of the Latin language. His Rudiments of Latin and English Grammar were published in 1772, and, though composed in a style which appeared to the generality of teachers as a dreadful schism and heresy, met with the approbation of a discerning few, whose praise was sufficient to overbalance the censure of the multitude. The mind of Dr Adam was that of a liberal; that is to say, he had more regard for new things with the appearance of much utility, than dread of forsaking old things, of which a small degree of good was ascertained with a great deal of evil. It had occurred to him that the hitherto universal practice of teaching children Latin in the language which they were yet to learn, was a solecism. He therefore had composed his grammar in English. Experience has now shown the propriety of this course; and the same system, we believe, must speedily be adopted in all other foreign and dead languages.

The next work of Dr Adam is entitled, *A Summary of Geography and History*, but the date of the first edition is not mentioned by his biographer. In 1791, he published his excellent Compendium of Roman Antiquities. For the copyright of this work he received L.600. His Classical Biography made its appearance in 1800, and half of the above sum was given for the copyright. Dr Adam's last, and perhaps his most laborious work, was his Latin Dictionary, published in 1805. Towards the beginning, his illustrations are brief, but, as he proceeds, they gradually become more copious. It was his intention to add an English-and-Latin part, and to enlarge the other to a considerable extent. In this favourite plan he had made some progress at the time of his death.

The latter part of Dr Adam's life was considerably embittered by the political aspect of the times. It scarcely requires to be explained, that the extreme danger in which the institutions of this country were placed by the French Revolution, caused the ban of the government, and of the major portion of society, to fall upon all who had given tokens of disaffection to the existing state of things, or even of a theoretical prepossession in favour of the abstract idea of liberty. The character of Dr Adam's mind, as already hinted, was that of a liberal in politics. He thus became so obnoxious a person, that many of even those who had been his pupils, could pass him by upon the street without notice. It is testified, however, by his eloquent biographer, Mr Henderson, that his character "derived a lustre of no common kind from his deportment amidst the harassing obstructions which were

raised up against his philological lessons, and from his firmness during the rage of political terrorism. He had to cope with prejudice in all its most malignant forms; yet in maintaining a contest, under which the powers of an ordinary mind would have sunk, he never absented himself from his official avocations for a single day. While he thus fulfilled his duties to the public, he also continued, with the utmost calmness, his extensive classical researches. This composure of mind he must have derived from no other source than a full conviction of the rectitude of those principles upon which he set out, and of the propriety of his conduct. Such a conviction must have been strengthened, and in a great measure formed, by the previous habit of proving to himself, by a course of rigid self-examination, the expediency or impropriety of every act before it was committed. Exertions of this sort can only be made by a most vigorous mind. When they have been improved into regular habits, however, the great affairs of human life become plain and easy. But how few ever attain such habits! and how seldom does the mind submit to such discipline, without much apparent effect!" We learn from the same source, that, by dint of his uncommon self-command, Dr Adam in a great measure withdrew himself from all pretensions to a political character. He had even the fortitude to abstain in a great measure from reading newspapers; a species of publication in which, as he remarked with a pathos that must appeal to every free heart, he felt scarcely any interest after the period of the French Revolution. His modesty at length had its reward, and gained back to respect those individuals who had formerly regarded the venerable grammarian with suspicion, and perhaps with worse feelings.

On the 13th of December 1809, Dr Adam was seized in the High School with an alarming indisposition, which had all the appearance of apoplexy. Having been conducted home, he was put to bed, and enjoyed a sound sleep, which appeared to have arrested the progress of the disease, for he was afterwards able to walk about his room. The apoplectic symptoms, however, returned in a few days, and he fell into a state of stupor. His last words marked the gradual darkening of the ray of life and intellect beneath this mortal disorder. He said, "It grows dark, boys—you may go," his mind evidently wandering at that moment to the scene where he had spent the better part of his life. This *crepusculum* soon settled down into the night of death; he expired early in the morning of the 18th of December 1809.—*Chambers's Scottish Biographical Dictionary*.

PLAGUE—CHOLERA.

In the course of the last five hundred years, the island of Great Britain has been visited by PLAGUE about twelve times, at every appearance assuming peculiar characteristics, and of a virulence more or less fatal to human life. In nearly every instance, the pestilence came out of the East, from whence it progressed to the most westerly parts of Europe. During the reign of Edward III., England was visited by a most destructive pestilence, which had swept away nearly a third of the inhabitants in every country which it attacked. It was more fatal in large cities than in the country; and about fifty thousand souls are said to have perished of it in London alone. During the reign of Elizabeth, another plague visited this island. Infection was caught by the English soldiers in France; and the bad diet and fatigue of the men, adding force to its operation, it swept off vast numbers: the remainder coming home to England, they brought the infection with them, and again the city of London was subjected to its ravages. In that city alone, twenty thousand persons died in one year of this dreadful malady. A still more fatal plague visited the metropolis in the reign of James I., when in one year, thirty thousand are computed to have died of it, though the whole population was then little more than one hundred and fifty thousand. In the succeeding reign of Charles I., another plague found its way to London, and committed great havoc; the Parliament had in consequence to be assembled at Oxford; but it soon after visited that place. All these plagues are, however, trifling in comparison to one which visited England in the year 1665, during the reign of Charles II., and which seems to have swallowed up all recollections of the preceding. De Foe has written a history of this truly terrific pestilence, as it took place in London; but, unfortunately, he has so much dressed it up in the garb of romance, that his details are unworthy of implicit credit. The most faithful account we have of the great plague in London, is one drawn up by a person called William Boghurst, an apothecary, as it appeared under his own experience; it is now to be found in manuscript in the British Museum, among the papers of Sir Hans Sloane.

Speaking of the "Evil Signs or Presages of the Plague," the writer says, "Among these were spots of different colours, hicough, vomiting, carbuncles or buboes, shortness of breath, stoppage of urine, drowsiness and thirstiness, contraction of the jaws, and large and extended tumours. Almost all that caught the disease with fear, died with tokens in two or three days. About the beginning, most men got the disease with fuddling, surfeiting, overheating themselves, and disorderly living.

Tokens appeared not much till about the middle of

June, and carbuncles not till the latter end of July, but were very rife in the fall about September and October, and seized most on old people, adult, choleric, and melancholy people, and generally on dry and lean bodies. Children had none. If very hot weather followed a shower of rain, the disease increased. This plague was ushered in with seven months' dry weather and westerly winds.

Those that married in the heat of this disease (if they had not had it before) almost all fell into it in a week or a fortnight after it, both in city and country, of which most died, especially the men.

Black men of thin and lean constitutions were heavy laden with this disease, and died, all that I saw, in two or three days. People of the best complexions and merry dispositions had least of the disease; and if they had it, fared the best under it. Pregnant females fared miserably. Strength of constitution was no safety. Death made the strongest assault upon strong bodies. All that I saw, that were let blood in the disease, if they had been sick two, three, four, five days, or more, died the same day. More of the good died than of the bad; more men than women; and more of dull complexions than fair.

In the summer before the plague, in 1664, there was such a multitude of flies, that they lined the insides of houses, and if any thread or string did hang down in any place, it was presently thick set with flies like a rope of onions, and swarms of ants covered the highways, that you might have taken a handful at a time. Also the small-pox was so rife in our parish, that betwixt the church and the pond in St Giles's, which is not above six score paces, above forty families had the small-pox.

The plague fell first upon the highest grounds; for our parish is the highest ground about London, and the best air, yet was the first infected. Highbate, Hampstead, and Acton, also shared in it.

Those that died of the plague, died a very easy death generally: first, because it was speedy; secondly, because they died without convulsions. They did but of a sudden fetch their breath a little thick and short, and were presently gone; so that I have heard some say, 'How much am I bound to God, who takes me away by such an easy death!'

One friend growing melancholy for another, was one main cause of its going through a family, especially when they were shut up, which bred a sad apprehension and consternation on their spirits.

Many women giving suck, freed themselves of the plague, by their children sucking it from them; but some continued well some days, sometimes weeks, and then fell into the disease after their children were dead.

The wind blowing westward so long together from before Christmas until July, about seven months, was the cause the plague began first at the west end of the city, as at St Giles's, St Martin's, Westminster. Afterwards it gradually insinuated and crept down Holborn and the Strand, and then into the city, and at last to the east end of the suburbs; so that it was half a year at the west end of the city before the east end and Stepney were infected, which was about the middle of July. Southwark, being the south suburb, was infected almost as soon as the west end.

The disease spread not altogether by contagion at first, nor began only at one place, and spread farther and farther, as an eating spreading sore doth all over the body, but fell upon several places of the city and suburbs like rain, even at the first, as St Giles's, St Martin's, Chancery Lane, Southwark, Houndsditch, and some places within the city, as at Proctor's Houses.

Of all the common hackney prostitutes of Lutener's Lane, Dog Yard, Cross Lane, Baldwin's Gardens, Hatton Garden, and other places, the common criers of oranges, oysters, fruit, &c.; all the impudent, drunken, drabbing bayles, and fellows, and many others of the Rouge Route, there are but few missing.

Authors speak of several kinds of plagues, which took only children, others maids, others young people under thirty; but this of ours took all sorts, yet it fell not very thick upon old people till about the middle or slack of the disease, and most in the decrease and declining of the disease.

Cats, dogs, oxen, horses, sheep, hogs, conies, all wild beasts, hens, geese, pigeons, turkeys, &c., and all wildfowl, were free from infection.

Great doubting and disputing there is in the world (says this author), whether the plague be infectious or catching or not; because some think if it were infectious, it would infect all, as the fire heats, and heats all it comes near; but the plague leaves as many as it takes; thus are they gruelled at such arguments, and cannot solve their doubts; and Van Helmont thinks all people catch it by fear: and generally every one is apt to judge by his experience; for if they have been in never so little danger, and yet have escaped without catching it, they presently think the disease not infectious; and if any one may draw his conclusion from this, I have as much reason almost as any to think it is not infectious, having passed through a multitude of continual dangers *cum summo vita periculo*, being employed all day till ten o'clock at night, out of one house into another, dressing sores, and being always in the breath and sweat of patients, without catching the disease of any, through God's protection; and so did many nurses who were in the like danger; yet I count it to be the most subtle, in-

fectious disease of any, and that all catch it not by fear neither (though this doth much, as Helmont thinks), for then children and confident people would not have the disease; but we see many of them also have it, and children especially most of any."

Such is an accurate account of the peculiarities of the plague in London. If that city and other towns in England thus suffered by these loathsome distempers, Scotland was not exempted from similar visitations. Till a comparatively recent period, this part of the island was continually suffering by "plagues, pestilence, and famines;" dearths, or scarcities of provisions, being ordinarily preliminary, or attendant on disorders of this nature. In the same manner that London was the chief seat of the plague in England, so Edinburgh usually suffered beyond all other towns in Scotland. We find that in the reign of James IV., in 1513 (the year before the fatal battle of Flodden), Edinburgh was visited by a severe plague. On its appearance, the whole town was thrown into consternation, and the magistrates having imprudently ordered the shops and booths to be shut for fifteen days, and neither doors nor windows to be opened within that time, but on extraordinary occasions, the malady, from such confinement of air, got leave to riot almost at will among the houses. Having at length exhausted itself, as much from the want of materials to operate upon as any thing else, it was gradually stayed, and at length disappeared. Edinburgh was not again attacked with pestilence till the year 1645, in the reign of Charles I., much about the time it affected London, Oxford, and other places. This instance of plague is still spoken of with horror by the people of Scotland. It stalked across the land as a destroying angel. All business and intercourse was suspended. The jails were every where opened, and their unhappy inmates released. Nothing stayed the visitation or modified the asperity of this dreadful scourge. The evils it produced were soon awfully enhanced by a famine, which either prepared victims for its approach, or smote them on its departure. To crown the national calamity, the country was at the very time cursed by the presence of a civil war, carried on between Charles and his Scottish subjects, and which tore society asunder. Edinburgh, Leith, Glasgow, and all the provincial towns, became objects of the utmost commiseration; the metropolis, however, and its seaport, Leith, suffered most. To such an unparalleled degree was this city spoiled by these complicated ravages, that, after the battle of Kilsyth, when Montrose threatened to reduce it to ashes, unless certain painful conditions were granted, it could with great difficulty raise sixty men capable of bearing arms! It seems that on this and similar visitations of plague to Edinburgh, the persons affected were, if possible, hurried out of the town to an hospital on the Boroughmoor—spacious downs south-west from the city.

Leith, we have said, suffered jointly with Edinburgh, though at the time numbering only from four to five thousand inhabitants. This devoted town, in eight months, namely, from April till December 1645, lost about 3000 individuals by plague; so that, as the record affectingly mentions, "the number of the dead was greater than that of the living." This predigious mortality soon filled both the churchyards, and the bodies were hence buried in all directions in the vicinity. No coffins on these melancholy occasions were used. As soon as the last breath of the sufferers gave token of death, they were swathed in the blankets in which they happened to be lying, and committed to the earth. This indeed has been substantiated in recent times, by the bones of these unfortunate plague-stricken individuals being occasionally dug up along with shreds of old-fashioned plaiding, when trenching the gardens and other grounds in the neighbourhood. The great famine followed, as usual, and reduced the town to the most pitiable condition; and such was the dearth, that the Scots Parliament gave the local authorities the power of seizing grain or food wherever it could be found.

The whole history of the plague, its course, and its character, are shrouded in impenetrable mystery. The disease used to enter at one end of a street, and clear all before it on one side, leaving the other free of its visit for a season. It used also to be stopped by water-courses, sometimes of the most trifling nature; thus, at Peebles, it took off nearly all the inhabitants on the western side of a gutter which runs across the main street (now covered up), while those on the other side were not affected. Though in general no respecter of persons, it seems to have attacked those who had a predisposing cause of some kind, there having been some people who, notwithstanding a constant contact with it for months, never took it at all. When the plague occurred in Dundee, early in the sixteenth century, all the infected were compelled to retire from the town, and either reside in the suburbs, or bivouac in the fields without the walls. A massive fragment of the ancient wall of the town, containing the gateway of what is called the East Port, still remains in one of the streets of Dundee. Upon the top of this, Wishart, the celebrated reformer, is said to have preached to those infected with the pestilence, who lay upon the ground below. It has survived all the rest of the wall, and was lately repaired at a considerable expense, out of reverence to the memory of Wishart. In a wild and secluded spot in Teviotdale, a considerable mound of earth is shown, under which it is said the plague was buried. There is a singular and awful distinctness in the tradition connected with

this spot. It was originally, say the people, a cottage, which contained the large family of a poor shepherd. At the present time, no trace of a place of habitation is discernible; it is a plain ordinary-looking hillock, upon the surface of which the sward grows as green, and the field-daisy blooms as sweetly, as if it were not, what it is, the tomb of human misery and mortal disease. The plague was introduced into this house by a piece of finery which the shepherd's wife purchased from a wandering pedlar, and wore for some time upon her head. She was speedily seized with the dreadful distemper, and took to her bed. Some of the children also beginning to feel affected, the shepherd himself went to the nearest farm-house to seek assistance. The inhabitants of this place, alarmed in the highest degree for their own safety, rose in a body, and, instead of attempting to relieve the infected family, spread the intelligence to the neighbours, who, being equally apprehensive with themselves, readily joined them in the dreadful decision, that mercy to individuals should be postponed to a regard for the general health. With this resolution, and disregarding the entreaties of the poor shepherd, they went *en masse*, and, closing the door upon the unfortunate family, proceeded to throw up earth round and over the cottage, till it was buried at least five feet beneath the surface. All the time of this operation, about half a day, the inmates, aware of their fate, cried dreadfully; and it was not till a large turf had been laid upon the top of the chimney, and a deep stratum of earth deposited over all, that their wailings were heard finally to subside. The shepherd is described as having for some time gone round and round the place like one demented, uttering fearful cries, and invoking heaven to save his family, till at last, being driven away by the people, he departed from the awful scene in a state of distraction, and was never more heard of or seen in the district.

At Linlithgow, there is preserved a curious relic of the plague—namely, a coffin or box, which was used in conveying all the persons who died of that distemper to their last abode. It possesses no peculiarity of appearance, except that it seems calculated to contain a body of the largest size, and that the bottom is a lid, moving on hinges, with a pin which serves by way of lock. The tradition of the town bears that the bodies of the dead were conveyed to their graves successively in this general coffin, and when brought over the hole, permitted to drop in, by merely withdrawing the pin. This indecorous mode of interment, so opposite to the ordinary customs of the Scottish people, presents us with a dreadful idea of this disorder, and of the hardening effect which its ravages gradually produced upon the feelings and ordinary sympathies of humanity. In Edinburgh, various superstitious ideas were cherished among the common people respecting the plague, which scourged the city in 1645. Throughout the Old Town, various places used to be shown where it was said the plague was shut up, and one in particular was pointed out as its burial-place. The former were certain old houses in Beth's Wynd, Mary King's Close, &c., the doors and windows of which were either almost or altogether buried beneath the adjacent ground, or covered up with such a thick layer of dust and mud, as it appeared they could only have contracted during the lapse of several centuries. When the old pest-houses of Beth's Wynd were removed in 1808, to make way for the extension of the Advocates' Library—for that storehouse of learning now occupies the site of the said dwelling-places of superstition—serious apprehensions were entertained by the gossips of the wynd, lest the plague should burst forth from its place of confinement, and do as much mischief in the neighbourhood as before it had been bound over to keep the peace. No result of any importance followed the destruction of the houses, however, except that beneath the floor of one of them, two workmen found a pot full of gold and silver coins, which had probably been buried there by an infected person, under the dread of being spoiled during his illness (which is said to have often been the case) by the cleansers, and never recovered by the unfortunate owner. We have not learned that any other valuables were found in these houses at their demolition; but can, with not the less safety, avouch that it was customary, when a house was shut up for the plague, to leave the whole of the furniture within. We were once informed, by an aged lady who had lived a good deal more than eighty years in Edinburgh, that when she was a girl, there were some houses in the close where she resided (Allan's, first east from the Exchange), said to be shut up on account of the plague, with all the furniture within, precisely in the same state as it had been left by the owners when they died. Though it was known that coin, plate, and other things of value, were deposited in one or more of these houses, they had been permitted to remain undisturbed for a century, and might have continued shut for a much longer period, but for a particular circumstance. When the Highland army came to Edinburgh in 1745, many of the soldiers, at the risk of military punishment, as is well known, committed such acts of rapacity as to give that gallant enterprise but too much of the appearance of a predatory invasion. Some, hearing of the treasures supposed to be concealed in the pest-houses of Allan's Close, and entertaining no fear of an enemy so long dead as the plague, resolved to break them open, and possess themselves of whatever they found—an innocent species of plunder, as they thought, which neither "ta law nor

ta prince" could be expected to visit with the punishment promised to the robbery of the living. They did break open the houses, and, as was expected, found many valuable articles, though, contrary to the anxious apprehensions of the neighbours, no fatal consequences ensued. The plate, which was all marked with engraven coats-of-arms, and the other things worth taking, were divided among the adventurers; and after the spell was thus broken, the houses were inhabited by poor people, who willingly encountered all the danger that could be supposed to remain, for the sake of a free habitation. What was very remarkable, one of the Highlanders, when the army afterwards visited Glasgow, lodged in the house of a relation of our informant, who discovered, by the arms engraved on a silver drinking cup in the man's possession, that the plundered house from which it was taken had belonged to his ancestor, and accordingly made an effort to take by force, and finally was glad to purchase, the said piece of plate, which he retained all his life afterwards as a family piece. The old lady from whom we derived this singular story, had also a tradition, that the ancestress of a certain wealthy family in Edinburgh had accumulated a vast quantity of money and things of value, by attending those who were dying of the plague, which she was enabled to do with perfect safety, on account of her having had the distemper before, and being, therefore, incapable of taking it again. The sick-nurses and cleansers, it seems, were usually the heirs of the dead, and many of them, like this person, laid the foundations of vast fortunes, which were, however, it was remarked, for the most part dissipated by their immediate successors. In Stirling, such were the ravages of the distemper, that all the magistrates and town-council died. The executioner also died. A mound is shown in the churchyard of Stirling as the burial-place of those who perished. It is said to be a vault of stone-work, but is now covered over with soil. Two particular men, who alone performed, or could perform, the duties of attending the sick, became, as is known from authentic records, proprietors of much more than the half of the town; yet so little does this seem to have affected the distribution of property in the long-run, that the only descendant of any of those two men, known to exist some years ago, was an old woman, who did not possess an inch of land, built or unbuilt; and there has been, ever since the oldest inhabitants can remember, just as plentiful a variety of "lairds" at Stirling as any other town of its extent. The memory of the circumstance is preserved by certain tenements and pieces of ground, which, though now in the hands of various proprietors, still retain the names of those who inherited them in the singular way mentioned.

One of the most picturesque anecdotes of the plague which we have collected in Edinburgh, bears, that, during the calamitous period, when the town was abandoned to the rapacious and the dying, the awful silence which pervaded the streets, quite as much by day as through the night, used only to be broken, in the dusk of the evening, by a cart going through the city, attended by a man, who rung a bell, and cried with a loud and solemn voice, "Throw out your deid!" Scarcely any thing could be conceived more awful than such a ceremony, performed under such circumstances. The place in Edinburgh where "the plague was buried," is situated in Leith Wynd. This ancient though much modernised street, as may be known to some readers, is skirted on one side by a fragment of the wall of the city. In the inside of this memorial of a former age, the soil rises almost to the very top, and is, for the most part, employed in the capacity of a garden. Towards the bottom of the wynd, a small part of the ground seems enclosed as a sort of bleaching green, being bounded on the west by a peculiarly tall house, in which there was once a Roman Catholic chapel (burnt by the Protestant mobs of 1779). From the wynd, the place is marked by a bulge, and peculiar blackness in the external wall, as if occasioned by the press and nature of the mould within—and by one or two spectre-like trees, which throw their dismal forms half over the rampart, apparently bleached by the dews which would have nourished them in their younger days, and not bearing any leaves even in summer. Beneath these trees, which seem to have been brought to their marrow-bones by the dreadful juxtaposition, "lies the plague." It was buried here, says an old female informant, "by candle-light, at three o'clock in the morning, by Mr Gusthart, minister, long ago of the Trinity or College Kirk, in presence of two witnesses, and not without ceremonies, such as praying and the like"—the aversion of the Scottish church to the burial service having been apparently done away with in the extraordinary case of "the plague." What "the plague" was, this worthy lady did not well know, but she promised to inquire. At a second visit, she informed our ignorance that it was a thing which long ago used to come into people's houses, "in the shape of long silken threads, palpable to the eye, but not to the touch, and which, flying about hither and thither in the air, cut the breaths of all with whom it came in contact. That her account of the funeral of the plague was true, she was quite certain; for she herself had been at the sewing-school, when a girl, with two Misses Gusthart, who were the granddaughters of the minister, and who told her the story. Her great-grandfather, moreover, who died at a most advanced age, while she was very young, "had seen the plague!"—so there was no occasion for incredulity.

Although popular tradition points to Leith Wynd as the place of burial of many who died of the plague in Edinburgh, and although such be quite correct in point of fact, as this place formed part of the churchyard of the neighbouring collegiate church, it is fully more consistent with record to mention, that many of those who died of the distemper were buried in the Greyfriars churchyard, in large graves, "seven fute wyde, and verie deepe." Many were also buried at the small remote chapel of St Roque, to the south of Burntsfield Links. We are informed, by historical evidence, that this had been from early times a place of sepulture for those who were carried off by the Edinburgh plagues. Why this religious establishment should have been selected for a purpose of this kind, is not adverted to by the historians of Edinburgh; and it is left for us to mention that St Roque, or Rochus, was long esteemed by our ancestors as the patron saint of those afflicted with pestilence. In the Breviary of Aberdeen, one of the earliest specimens of Scottish typography, we have some curious particulars regarding him. He was of foreign birth, and flourished in the fourteenth century. There is no end of the miracles he is said to have wrought, both before and after his death. "Vale, Roche angelice," concludes the Breviary, "voce citatus famine optimisti deifice a cunctis pestem peller." At the Reformation this sainted physician lost his reputation—the revenues of his chaplain were seized, and his chapel demolished; still the force of ancient custom remained, and the people of Edinburgh continued to inter their plague-stricken relations in the little burying-ground. But we are probably tiring our readers with these melancholy memoranda of times to which the present has too lamentable a resemblance; so we pass on to the plague of our own days.

The spasmodic cholera of modern times is evidently one of those oriental plagues, which, though greatly modified in its effects, and different in its mode of attack and symptoms, has been in the same manner generated in the pestilential jungles of Hindostan, and in the same manner has progressed a distance of eight thousand miles towards the north-west, laying every principality and power successively under contribution to its insatiate appetite. All that is known of plague and cholera is a number of isolated facts, often of a contradictory nature, and no way capable of forming a body of evidence on which any correct theory can be founded. Cholera is certainly far more capricious than plague. It will travel against the wind at the rate of more than a hundred miles a-day. It despises the temperature of the atmosphere, and will malignantly frolic under a frost which withers every species of vegetation. Sometimes it keeps to a line of road, or a river, captivating town after town, as they happen to fall in its way; and at other periods it will skip over two or three towns at a time, just stooping here and there to pick up a victim, as it were, out of the mere wantonness of mischief. In our opinion, he would be a cowardly and short-sighted man who would leave a town because cholera threatened an invasion. If he fly, he may either meet it or overtake it, while all the time it has never come near the house he has left. Going to the country is utterly useless, for it may pounce upon you in an instant, though you were immersed in the innermost recess of a mountainous wilderness. In a city you are surrounded by an innumerable body of the most intelligent physicians, all acting in concert, and each contributing his solitary fact to swell the mass of useful knowledge on the subject. Under a visitation of plague, mankind might always be allowed to repine; but under a visitation of cholera, they have much to comfort them. Its general selection of victims from among the dissolute and famished, in which it entirely differs from plague; its general aversion of those of regular habits who enjoy good food and raiment; its putting to death only a third or a half of those it attacks; its premonitory symptoms or warnings; its liability to be cured by certain specific remedies; the safety with which medical men may attend it; the great chance of escaping it by retaining a perfect cheerfulness of disposition; but, above all, this remarkable fact, that in most countries which it has visited, it has not increased the amount of mortality in the aggregate, reckoning in a whole year; for it seems, in some measure, only to take those persons who would catch any sort of epidemic that happened to be going. Taking these and other peculiarities of cholera into account, it may be safely pronounced an exceedingly modified species of plague. Having already exhausted itself on the Continent of Europe, it is now passing over the island of Britain, always keeping onwards towards the west. Whether, on arriving at the shores of the Atlantic, it will venture to cross that spacious sea, of three thousand miles in breadth, and will land, re-invigorated by its voyage, among the nations of America, is a problem that cannot long be in being elucidated. These lines will probably never meet the eye of a living soul in that great Western World, otherwise we would beseech its inhabitants instantly to prepare, with the manliness and intelligence of men descended from a British ancestry, for the reception of this hated scourge; and in using those means for its prevention and cure, placed by the good providence of God within the scope of their comprehension, will in the end, we trust, oblige it to pass innocuously over their settlements.

This article has been necessarily drawn to an extraordinary length, and leaves us to regret the space

which it has occupied; we therefore, without one word of comment, conclude by offering the following advice to families, regarding the means to be used to prevent and cure the cholera now in progress, extracted from the works of the best medical practitioners:—

CLEANLINESS.—Personal cleanliness is strongly recommended, and a careful removal of every source of filth which may render the air impure. Great care should also be taken that rooms and houses be well ventilated.

DIET.—Indigestible articles of diet, such as undressed fruits, should be avoided.

TEMPERANCE.—The abuse of spirituous liquors tends greatly to lessen the influence of remedial means, and, consequently, to render the disease more fatal. Temperance is therefore strongly enjoined.

SYMPTOMS OF THE DISEASE.—The disease is preceded by languor, coldness, giddiness, and slight bowel complaint. It usually comes on with purging, vomiting, and cramp; then follow smallness of the pulse and coldness of the skin; the features become sharp and contracted; and the eye sinks. These early symptoms are more or less felt from one to three days before the attack.

REMEDIAL MEANS.—It is of the utmost importance that the premonitory or early symptoms should be attended to, and medical assistance procured as early as possible; but as the disease may occur under circumstances where medical advice cannot be immediately obtained, the following measures may be safely and beneficially employed.—All means tending to restore the circulation and maintain the warmth of the body should be had recourse to without delay. The patient should always be immediately put to bed, wrapped up in hot blankets, and the warmth of the body should be sustained by the application of bags, containing hot salt or bran, to different parts of it. For the same purpose, stone bottles or tin canisters, filled with hot water, should be employed. Two teaspoonfuls of the flour of mustard-seed, mixed with half a tumbler of warm water, to be given to excite full vomiting; afterwards, a wine-glassful of brandy or whisky, mixed with hot water, will be useful. If the disease continues, from twenty to forty drops of laudanum may be administered, along with two teaspoonfuls of magnesia in peppermint water. If there be pain of the stomach, a mustard poultice ought to be applied over it. Should the symptoms not abate in an hour, or an hour and a half, the draught, with laudanum, may be repeated.

THE MUSSULMAUN'S SABBATH.

As a religious rest, the Sabbath is but partially observed by Mussulmauns. The Soonees, I have remarked, pay much more attention to its institutions than the Sheahs; but with either sect, the day is less strictly kept than might have been expected from people who really seem to make religion their study and the great business of their lives. Both sects have extra prayers for the day, besides the usual Namaaz, which the religious people perform with great punctuality, whether they carry their devotions to the great mosque, or offer their prayers in due form in their own abode. On the Sabbath they make it a point to bathe and change their apparel; the public offices are closed, and the shops partially shut until mid-day; the rulers—as Kings or Nuwaubs—distinguish the day, by not receiving their courtiers and the public visitors, as on other days. Charitable donations are likewise more bountifully dispensed from the rich to the poor on Friday. These observances serve to convince us that they believe in the constituted Sabbath; still there is not that strict respect for the holy day which could satisfy the scrupulous feelings of a Christian; the servants are quite as much employed on Friday as on any other day; the dhurzie (tailor), dhobie (washerwoman), and indeed the whole establishment of servants and slaves, male and female, find their work undiminished on the Sabbath. The ladies amuse themselves with cards and dice, the singing women even are quite as much in request as on other days; and all the amusements of life are indulged in, without once seeming to suspect that they are disobeying the law of God, or infringing on their actual duties. Indeed, I believe they would keep the day strictly, if they thought doing so was a necessary duty; but I have often observed, that as Friday is one of their “fortunate days,” works of any importance are commenced on this day; whether it be building a house—planting a garden or a field—writing a book—negotiating a marriage—going a journey—making a garment, or any other business of this life which they wish should prosper. With them, therefore, the day of rest is made one of the busiest in the calendar; but I must do them the justice to say, that they believe their hearts are more pure after the ablutions and prayers have been performed. And that as nothing, however trifling or important, according to their praiseworthy ideas, should ever be commenced without being first dedicated to God—from whose mercy they implore aid and blessings on the labour of their hands—they set apart Friday for commencing whatever business they are anxious should prosper. This was the excuse made by the pious Meer Hadjee Shaah.—*Mrs Meer Hassan Ali's Hindoostan.*

THE WASP.

The manners of wasps are truly curious; but we are not about to enter upon a particular description of them. It is one quality only that we would at present mention—the power of the wasp to make paper. The substance of which the wasp's nest is made is actually paper; and the wasps knew how to make paper long before man did. And it is particularly worth notice, that at this very time a new method of making paper is said to have been discovered—namely, to make the paste (or pulp) for the paper with the fibres of rotten wood. A French gentleman, M. Brad, says he was determined to try whether he could not devote to some useful purpose a substance which seemed so useless. He took a large quantity of rotten wood, and removed the knots and parts from it. This was then put into an oil-mill, and ground; it was watered, and afterwards put into sacks to drain off. The paste thus formed was taken to a paper manufactory; and after going through the usual process, about 500 lbs. of greyish paper were produced, fit to be written on, although no glue had been applied to it. By pasting a number of sheets together, he formed a pasteboard sufficiently solid and light for ordinary uses. The wasp is a paper-maker, and a most perfect and intelligent one. Whilst mankind were arriving by slow degrees at the art of forming this valuable substance, the wasp was making it before their eyes, by very much the same process as that by which human hands now manufacture it with the best aid of chemistry and machinery. While some nations carved their records on wood, and stone, and brass, and leaden tablets, others more advanced wrote with a pointed instrument on wax; others employed the inner bark of trees; and others the skins of animals rudely prepared—the wasp was manufacturing a firm and durable paper. Even when the papyrus—the flag growing on the banks of the river Nile in Egypt—was by a process of art made to serve for paper, the wasp was a better artisan than the Egyptians; for the early attempts at paper-making were so rude, that the substance produced was almost useless, having no firmness of texture. The paper of the papyrus was formed of the leaves of the plant, dried, pressed, and polished. The wasp alone knew how to reduce vegetable fibres to a pulp, and then unite them by a size of glue, spreading the substance out into a smooth and delicate leaf. This is exactly the process of paper-making. It would seem that the wasp knows, as the modern paper-makers know, that the fibres of rags are not the only materials used in the formation of paper. She employs other vegetable matters, converting them into a proper consistency by her laborious exertions. In some respects she is more skillful even than our paper-makers; for she takes care to keep fibres of a sufficient length, by which she renders her paper as strong as she requires. Many manufacturers of the present day cut their material into small bits, and thus produce a rotten article. One great distinction between good and bad paper is its toughness; and this difference is produced by the fibre being long, and therefore tough, or short, and therefore easily pulled to pieces.

A JUDGMENT OF GOD.

It was upon one of these occasions, when Jeroboam stood by his altar at Beth-el, that God sent a prophet from Judea to rebuke the idolatrous monarch, and to predict the overthrow of that very altar, by a prince of David's line, called Josias. Jeroboam, incensed at the insolence of the speaker, stretched out his hand to arrest him, but he had scarcely done so when the arm withered, and he was unable to draw it back. Alarmed, rather than conscience-struck by the judgment, Jeroboam entreated the prophet to pray for him, which was done, and the use of his arm restored; but the king took no further notice of the prophet's rebuke, except by inviting him to his house with the promise of a reward. This, however, the stranger declined, declaring that God had positively forbidden him to eat or drink within the bounds of the impious kingdom, and that even to return by the way which he had followed in coming was prohibited. He accordingly mounted his ass, and leaving the assembly to think what they might, took a new direction homewards.—*History of the Bible.*

CATS.

We are informed by Brown, in his *Natural History of Jamaica*, that cats are considered a very dainty dish among the negroes; and Goethe, in his *Rifelman's Comrade*, says—“At Palermo, some of the soldiers caught a cat belonging to a convent, and having skinned the carcase, it was cut into pieces, and soaked twenty-four hours in vinegar, then anointed with garlic and honey, until the strong flavour had left it, after which it formed an excellent *fricassée*. To be serious,” continues our author, “I can assure my readers that the flesh of a well-fed cat is extremely good. It is indeed (presuming her to be properly dressed) not only agreeable in taste, but actually a dainty; and it is imagination and prejudice alone which protect the feline race amongst us from the uses of the gastronomic art.”—*Brown's Anecdotes of Quadrupeds.*—[The people of Palermo have a right to exercise their own taste in cooking and eating the gigots of cats, and I shall not quarrel with them for doing so; for my part, I prefer to stick to our good old Scottish fare, and would recommend all my readers to do the same.]

ANECDOTE OF MR JEFFREY.

The present Lord Advocate for Scotland was the son of an under-clerk of Session, and was born in the upper part of a house in the Lawnmarket, very near the spot where the celebrated David Hume is said also to have first seen the light. The house happened to take fire at the time when the future Lord Advocate was only about a year old, and in the hurry of saving other things, the child in the garret was for a long time forgotten. When it was almost too late, he was remembered, and an honest man, by trade a slater, volunteered his services in rescuing the infant from his perilous situation. With much difficulty, and no little danger, he was brought forth from the burning house, and delivered into the arms of his anxious friends. Thus was a life, which assuredly has been of some importance in Scottish literary and political history, preserved by the courage of a poor tradesman. It is pleasant to have it to record, that many years after this event, when Mr Jeffrey had commenced his career at the bar, the poor slater, happening to get involved, by no misconduct of his own, in a ruinous series of legal troubles, applied for advice to Mr J., who, in gratitude to his disinterested preserver, exerted himself in such a way as completely to extricate him in a very short time. We believe we may safely add, that this conduct on the part of the Lord Advocate is no more than what all who know him would expect from him under such circumstances.

FOWLS.

It is perhaps seldom that fowls can be kept conveniently about a cottage; but when they can, three, four, or half a dozen hens, to lay in winter, when the wife is at home the greater part of the time, are worth attention. They would require but little room, might be bought in November and sold in April, and six of them, with proper care, might be made to clear every week the price of a gallon of flour. If the labour were great, I should not think of it; but it is none; and I am for neglecting nothing in the way of pains, in order to ensure a hot dinner every day in winter when the man comes home from work. As to the *fattening* of fowls, information can be of no use to those who live in a cottage all their lives; but it may be of some use to those who are born in cottages, and go to have the care of poultry at richer persons' houses. Fowls should be put to fat about a fortnight before they are wanted to be killed. The best food is barley-meal wetted with milk, but not wetted too much. They should have clear water to drink, and it should be frequently changed.—*Cobbett's Cottage Economy.*

SMOKING.

The smoke of tobacco drawn into the mouth, without being inhaled into the lungs, acts powerfully on the nervous system, and produces the effects of a stupefying narcotic: hence its use among the lower orders. The chewing of tobacco has the same influence; and if the saliva be swallowed, its effects are powerful and dangerous. The powder of tobacco, called snuff, drawn into the nostrils, produces on those unaccustomed to its use, immediate but momentary intoxication, along with much sickness. This baneful plant is supposed to have been introduced into England by the fleet of Sir Francis Drake, in 1586.—*Lardner's Cabinet Cyclopædia.*

HAARLEM.

We paid a sovereign for an hour's enjoyment of the organ in the Cathedral of St Bavon, which is admitted to be the finest in the world. It has eight thousand pipes, and sixty-eight stops. The largest pipe is thirty-two feet long, and sixteen inches in diameter. One of the pieces we heard, represented a band with every variety of music; another, a storm of rain and thunder, the effect of which was astonishing. The loud peals of thunder seemed to roll over the building, while drops of rain beat violently on the roof. The storm gradually exhausted itself, and all was calm.—*Elliot's Letters from the North of Europe.*

UNNATURAL CHARACTERS IN FICTION.

No character can enter a human imagination which is not within the compass of Nature's possibility, but there is much in Nature which has never entered the imagination. What imagination ever conceived any thing so outrageous as Jack Mitford's acknowledgment that his love of gin was so great, that if his soul were on one table, and a gin-bottle on the other, he would barter the former for the latter?

THE KING OF NAPLES.

The late king of Naples, playing once at cards, exclaimed, on making a fault, “I am an ass.” Duke —, whom he was playing with, made a mistake soon after, and said, “And I am a greater ass than your majesty.” The king never played with him again.

EDINBURGH: Published, weekly, by W. and R. Chambers, 19, Waterloo Place; ORR & SMITH, Paternoster-row, London; and YOUNG AND CUNNINGHAM, Dublin. Agent in Glasgow, JOHN MACLEOD, 20, Argyle Street; and sold by all other Booksellers in Great Britain and Ireland.—“Chambers's Historical Newspaper,” a Supplement to the present publication, is published on the first of every month; and “Chambers's Information for the People,” of which every number is a distinct branch of human knowledge, appears once every fortnight.—Subscribers in Edinburgh may have these papers left at their houses as they appear, by giving their addresses at 19, Waterloo Place, and paying subscriptions for a quarter, a half year, or a year, in advance.—Price of a quarter of the Journal, 1s. 6d.
From the Steam-press of W. and R. Chambers.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM CHAMBERS, AUTHOR OF "THE BOOK OF SCOTLAND," "GAZETTEER OF SCOTLAND," &c.

No. 2.

SATURDAY, FEBRUARY 11, 1832.

PRICE THREE HALFPENCE.

RETROSPECTIVE REVIEW.

I AM fond of a walk through an ancient library, in which the long dim vista is partially illuminated by coloured streaks of light darted through the painted windows, so as to leave the room, here and there, in gloomy shade. How awful and sublime it is to plant one's self in the midst of this dignified silence, with a sombre Gothic roof overhead, and where, all around you, is built up the concentrated knowledge of man! How solemn the reflection, that, here, you stand the only living soul—the only being that breathes, and has power to speak, and can use a pen with his fingers; while, standing so near you, there are thousands of disembodied authors, whose mortal frames have long since sunk into the dust, to which you yourself must ere long be also carried! How transcendent was the idea! how Godlike was the invention! of transferring the greatest minds of the past and passing ages into books; so that, at the distance of hundreds of years, their successors on this ever-shifting stage are enabled to receive their instructions as fresh as from their living lips. How sweet and edifying is the converse which may be held amidst the chequered lights of such a chamber, with the sages of other years! How superior is such an enjoyment to those procured from many of the vain frivolities of the passing world! With what thankfulness do I lay down my friendly monitor!—with what reverence do I commit the instrument of his instruction to its little receptacle, there to remain till again consulted by some similar visitor, probably a century after I shall have joined the spirit with whom I have been meditating. There is something agreeable to the feelings of a living visitor, in these occasional researches amongst the volumes of almost neglected libraries. In the delight of drawing forth and consulting some volume, upon which the dust of years has been permitted to repose, the visitor, if himself engaged in the task of diffusing knowledge by the press, is apt to reflect, that, when his works are perhaps consigned to a place in the range of volumes, he may be indebted to some similar enthusiast for the compliment of having *his own dust* swept away, and his instructions brought once more into actual use. While he is gratifying, as he half supposes, the unseen spirits of the place, he reflectively gratifies himself. Having lately sauntered, in the mood of mind now described, through a large library of neglected books, I was impressed with the idea, that, to take up a dust-covered volume at random, and communicate to the present generation some part of whatever wisdom it contained, would not only be an act of homage from the living to the dead, in itself highly commendable, but might be attended with much benefit. At the bottom of a neighbouring pilaster lay a tattered volume, of old-fashioned appearance, which seemed to be so much despised as not to be conceived worthy of a place on the shelves; this, I thought, is a favourable specimen with which to commence my experiment. I therefore took it up, brushed off its coat of dust, and found it to be entitled, "Thoughts, Moral and Divine, upon Various Subjects, by Wellins Callcott, Gent., London." The reader will be able, after perusing the following extract from its pages, to say whether my resolution be one worthy of being pursued any farther; but, in the meantime, I must express my own admiration of the fine strain of moral feeling which pervades the passage which follows, as well as the simple grandeur of its style. Probably, every successive week, I shall present to my readers a short piece of solemn or pious composition, equally calculated to fill their minds with virtuous or sacred reflection. The subject is *Honour*.

"The nearest way to honour is for a man so to live that he might be found to be that in truth he would be thought to be. 'Tis honourable to support the glory of one's ancestors, by actions which correspond with

their reputation; and it is also glorious to leave a title to one's descendants which is not borrowed from our predecessors; to become the head and author of our own nobility; and (to use the expression of Tiberius, who was desirous of hiding the defect of birth in Curtius Rufus, though otherwise a very great man) to be born of one's own self.

"True honour is seated in the soul. It rises from a generous heart, and flows with a natural and easy descent into all the different traces of life and channels of duty, refreshing, invigorating, and adorning all the faculties of the soul, the language of the tongue, the very air of the face, and motions of the body. It displays itself in a natural unaffected greatness and firmness of mind, improved by a train of wise and religious reflections and generous actions, in which personal virtue and real merit truly consist. The Jewish Cabalists had a pretty allegory to express this truth, as founded in the original make and frame of nature. They tell us, that, when Moses describes the great river of Eden branching out into four streams, we are to understand by paradise the mind or soul of man. The river was this original fountain of truth and virtue, arising from the very root and essence of the soul, and branching out into the four cardinal virtues, and all the other lower degrees and kinds of virtue—even the inferior morals of affability, politeness, good nature, and good manners; and that, in short, there lies hid in the root of every human soul, however defaced by ignorance and deformed by vice, a fund of good, an oracle of truth, which, when assisted by a happy concurrence of external causes—such as, particularly, the structure of the organs and the texture of the blood and spirits—will, by due culture and discipline, naturally exert itself into a train of great, generous, and beneficent actions, suitable to the original grandeur and dignity of its nature. This, in the present debased state of human nature, lies very often buried under the ruins of ignorance and vice, like valuable coins, medals, statues, pillars, and other beautiful ornaments of architecture—or, to speak more properly, that order, symmetry, and proportion, which were as the soul of the structure—lie buried under the ruins of a once famous and magnificent building. Hence it comes to pass, that many an excellent genius is lost to the world—lies hid amongst the rubbish of mankind—who, with proper assistance, due culture, and in a happy situation, might have done honour to human nature, and been a public blessing to mankind. A man of honour, considered in this light, performs not only all the acts of virtue in public and private life, but does them with a peculiar propriety and dignity of behaviour, as the connoisseurs in writing, painting, music, architecture, or even dress, execute even the justest designs, not only with proportion and truth, but with such decorations, embellishments, and graces, as naturally flow from a fine taste and an improved understanding. This alone, in high life, makes glorious princes, illustrious heroes, gallant commanders, vigilant magistrates, and honourable counsellors; and, in the lower degree of social life, indulgent husbands, tender fathers, affectionate friends, merciful landlords and masters, faithful tenants and servants; and executes all the relative duties of life with justice and honour. This is the true and real virtue, the only proper foundation of all the honourable distinctions among men in all the different stations of life. The bulk of mankind are caught by noise and show. The pompous sound of titles and glitter of ornaments strike their senses, attract their attention, raise their admiration, and extort from them all that reverence and regard which are due only to eminent and distinguished merit; while real virtue and true honour pass silently through the world, unheeded and unregarded but by the happy

discerning few who are sensible of its merit, or enjoy the blessed communication of its influence. When those glorious spirits, whom Providence has appointed to be our guardians and protectors in this present state of imperfection and probation, survey the disordered state of human nature, agitated by blind passions, prejudiced by false opinions, into erroneous conclusions and wild pursuits, they view us with the same light, and with the same emotions of compassion and charity, as Monroe did his lunatic patients in Bedlam, who misal and misapply almost every instance in which their duty and happiness is concerned. To those blessed intelligences, the silent life of a generous, compassionate, beneficent man, is more truly honourable than the pageantry of princes, the pomp of conquerors, and all the glorious impertinence of state. To them, an obscure good man, doing secret acts of charity, relieving the distressed, comforting the miserable, and approving himself, by habits of piety and devotion, to the great Author of his being, appears more truly glorious than the conqueror at the head of an hundred thousand men. To them the Man of Ross appears in a fairer light in the Book of Remembrance, and will ever make a much more illustrious figure at the last great day, than Alexander, or Cæsar, or William the Conqueror, though a Christian. For to do good, to be lovers of mankind, to alleviate the distressed, and promote the peace and happiness of our fellow-creatures, is the highest honour, the noblest ambition, that can enter into the heart of man. But the greatest part of mankind judge quite otherwise. Noise and show, title and equipage, glitter and grandeur, constitute the whole idea of honour; and whoever can command an interest sufficient to procure, and an affluence sufficient to support them, becomes thereby not only a man of honour, but even a subordinate fountain of honour to others."

BURNS'S "JOLLY BEGGARS."

THE scene of the "Jolly Beggars" was an hostel in Mauchline of the lowest possible description, to which beggars and vagrants resorted for lodging and food. It was adapted for the entertainment of such characters only, and no other sort of persons ever entered it, excepting, perhaps, such wags as Burns himself, when bent upon amusement, and desirous of seeing the lowest scenes which human nature can exhibit.

At the time Burns composed his poem, there were several houses of this kind in the country. At that period there were infinitely more beggars than at present, and their lodging-houses were of course more numerous. Begging might be said to have been then a much better trade, partly on account of the greater hospitality of the times, and partly by reason of its professors being generally useful in retired places, as news-venders, as tale-tellers, and occasionally as smugglers. The "randie gangrel bodies" of 1785 were therefore a more opulent and riotous class than those of the present degenerate days. They could afford to spend between ten and twenty shillings in a week upon the pleasures of a lodging-house, and to sit at their liquor from Saturday night till Tuesday or Wednesday morning; not that a lodging-house was preferred before other places of abode—as indeed a farmer's stable, loft, or outhouse, with a good supper before bed, and their "parritch" in the morning when they rose, was invariably a more delectable object, as being perfectly eleemosynary—but it was generally made a fixed point among them to taste the luxuries of "Poosie's" hovel at least once a-week, if funds were answerable, in order to refit for the next campaign, and see their friends. The regularity of their meetings may be authenticated from Burns's own words:—"In Poosie Nansie's held the splot," the

use of the definite article indicating that it was a constant custom.

The person who supplies the information contained in this article happened, about the year 1794, to be personally intimate with the scenes so imitatively described in the poem, it being part of his duty, as a citizen-constable, to visit, every night, the house to which the Jolly Beggars resorted, to see that every thing was quiet and orderly. To the admirers of the cantata it may be interesting to have a more minute account of this scene in every particular than Burns has given; and though his sketch must fall infinitely short of the poet's outline, he will at least pledge himself to give a faithful transcript of his own recollections.

Poosie Nansie's cottage was a ruinous hovel of one story, with the thatch broken in several places, so that the family were sometimes blessed with the dews of heaven in the most direct manner. From without, the house appeared to have two windows, one at each side of a low oval-shaped door; so that the contour of the whole bore no small resemblance to the visage of a cat; the two chimnies rising from the roof being supposed to represent the erect ears of the animal. On entering, you were not troubled with the ceremony of an inner door, nor was there any extent of lobby to traverse. About one yard forward from the outer door, on turning the corner of a small projection, the whole scene lay exposed to view. One end of the tenement was the room common to all. The price of lodging in this part of the domicile was one penny. The accommodations were of course by no means elegant. Here there was no form of beds, but merely a common heap of straw, of which a couch could be made by the guests themselves, according to their own pleasure, or the means they possessed of dressing it. The straw was squalid to the utmost degree, and chopped so small, by long service, that it was more like chaff than straw. However, a covering of "orra duds" made it quite as pleasant as if it had been less equivocal in its appearance. The chimney stood out from the gable of this apartment, like a pulpit, and almost as large. Here in the evenings an immense fire was lighted, where Poosie herself—an old, bearded dame—was eternally engaged in cooking, and round which all the wretches gathered, to drink their "dear Kilbagie," &c. The furniture consisted of the merest fragments: stools, originally quadruped, degraded into tripods, and even, in some instances, into bipeds; a long deal table with turned legs, one limb tethered to the other to keep the whole from straggling, and propped into a horizontal position by supplementary peats; pots that, in the course of time, had come to answer completely the fanciful description of the Irishman, "wanting feet, ears, and cheeks, with a hare-lip into the bargain;" even the articles of stoneware seemed to be in the most dilapidated condition; the most of them had ceased to be vessels of quantity, and become mere shreds of plain surface; or if a hollow was attained, it was only at the expense of a larger vessel; for instance, a cup was perhaps fashioned out of the larboard side of a tureen.

Such was the apartment of Poosie Nansie's house, in which lodging was to be had at the low price of one penny. This was the House of Commons: now for the House of Peers! The House of Peers was the *spence*, or better part of the dwelling, in which the more respectable sort of beggars were deposited, apart from the vulgar throng. A division was accomplished by means of a partition formed of straw, curiously wattled and mixed with clay. The accommodations here were considerably superior to those of the meaner apartment. Here there were actually beds!—beds formed of straw, it is true, but yet possessed of the inestimable advantage of a species of covering like horse-rugs. Here there were also chairs, generally with bottoms, and sometimes even with backs. One side of the Chamber of Peers was entirely occupied by two ranges of beds in tiers; and "the kipples" in this part of the house were covered with a firm footing, and filled with receptacles like "chicken-cavies" ranged all round, which were accessible from below by an infirm trap-stair, fashioned like a hen's ladder. The price of lodging in this magnificent quarter was twopence.

But what avails it to describe the mere externals of the immortal Poosie Nansie's hostelry, if its internal economy, its wonderful inmates, and its glorious "splores," are to remain undelineated? Oh, for the pen of Burns, to fill up the exquisite outline which he has left us—to paint a Saturday night scene in all its depth and breadth of colouring, and with that minute faithfulness of touch so necessary to a general comprehension of the whole! Alas, the only hand that could do it justice is torpid, and forgetful of its cunning! The sun himself is set, and a dim "gloamin'" alone remains, capable of throwing but little light upon the subject. We have promised, however, to do our best.

As the approach of night calls home all the creatures of animated nature to rest and enjoyment, so, in these good old times, did Saturday night, the sunset of the week, bring to roost all the stray sons of poverty, bent upon compensating, by the festivity of one night, the contumelies, the wanderings, the hunger, cold, pain, and abstinence, of the rest. On that evening, therefore, whole fleets of mendicants might be seen thronging the roads, bound for Poosie Nansie's, to "haud the splore," and pouring in at all the "town-ends" in Mauchline. The oval-shaped door

we have described received them within its *crater*, as the bughole in the genie's cask, in the *Arabian Nights' Entertainments*, received the vapour into which the fisherman had caused him to dissolve himself. Then would there be recognitions of acquaintance, and the most ceremonious shaking of hands imaginable; for they were always ceremonious, till such time as the ice of politeness was thawed by the genial warmth of a few preliminary drams; when, of course, there was a greater community of friendly feeling throughout. But not more wonders in the dissolution of ceremony did Poosie's Kilbagie achieve, than did her large pulpit-looking fire round which they gathered, in respect of relaxing with equally potent heat the cripple limbs of the company. It was truly amazing to witness the miracles wrought by Poosie's wonderful fire. The miserable wretch who perished with the rheumatism, and walked double through the week, was cured in an instant, as if the demon of the disease had fled from his bones on coming within the influence of a spell. The "po-or oul'd bli-nd man," who had howled forth the terrible circumstances of his condition, vexing the ears of the lieges, for six long days, suddenly opened his eyes to the blessings before him, as if he had only awoke from a long sleep. The "poor sailor lad," too, who had lost an arm with Rodney, on the glorious 12th of August 1782, seemed suddenly to forget all the effects of the engagement, and, in the twinkling of a hand-spike, the long deceased limb sprang from the jacket, into all its pristine health and vigour. More astonishing resurrections than even that took place. Legs accustomed to "limp wi' the spavie," recovered their vigour and proportion. Legs grew down from trunks formerly truncated, and arms sprang from shoulders erst apparently stumps. Immense blotches, that, in week days, excited the commiseration of the charitable, in the character of plague-spots upon the skin, at once disappeared, "and, like the haselless fabric of a vision, left not a wreck behind." The man "with a brown leg and a blue one," who had "had the black scurvy in Jamaica, and come home a poor helpless object," became in a moment the soundest and liveliest man in the company; and the wretch who trembled through the week between two crutches, as if every part of his body were taking leave of the other, now shivering with the ague, and at other times agonised by the cramp, threw by his wooden friends, and was "himself again." In short, the transformations and cures accomplished at Poosie Nansie's fire-side were miraculous and manifold. Suffice it to say, that the blind saw, the deaf heard, the dumb spoke (nay, "ranted and sang"), the lame walked—and *all drank*. In the latter department, there was not a single inefficient member.

No sooner were the window-shutters of night all fairly closed in, and every thing snug, than the festivities of the evening commenced. Tea was paraded by the females of the company, and drunk from *buggies*, *caups*, and *finnies*, all of them vessels not easily broken. Fowls and pieces of meat were sometimes produced from secret wallets, and bacon ham was no unusual dish; all of which were hastily prepared by frying, for they had no delicacy of taste in cooking. To these were added savoury messes, consisting of cold meat, eggs, hares, and other articles of food the most incongruous in association, seasoned highly with salt, pepper, onions, and occasionally garlic. As soon as the feast was pretty well over—for it never could be said to be altogether done—the fiercer debaucheries began, and the hostess was in perpetual demand for supplies of more liquor. Nansie did not retail spirits herself, but procured what was wanted from a neighbouring shop, where she was allowed a small emolument for her custom, which she contrived to increase not a little by cheating her guests of an enormous commission (in kind) for her trouble. Kilbagie was then sold so low as one penny per gill;* of course, it was quite possible to get completely intoxicated for fourpence. Over this stuff they were wont to carouse till midnight, when the mirth and fun generally grew so fast and furious, that nothing could contain them, and their joy could only find vent in the confusion of a dance, or a squabble. If the former amicable method chanced to be adopted, the floor was cleared in an instant for action. The whole of Nansie's furniture was promiscuously huddled into a corner, and to it they set, men, women, and children, like a parcel of infuriated Bacchanals, tossing their limbs wildly about, and using gesticulations, and *setting* into attitudes, that no language can paint. After tiring of this exercise, they would again sit down to deep debauch, and drink till morning light, about which time all that had survived the soporific effects of the liquor were commonly engaged in a Polymachia, or battle general; which exertion was for the most part quite as effectual in laying the company low, as the Kilbagie. They seemed to fight themselves out, in short; and one by one dropped from the scene, till not a combatant was left. All were on the floor, dead, flat, and peaceable. Sunday morning, which, rising in Scotland, finds all nature reduced to a state of perfect calm, usually found the inmates of Poosie Nansie's hotel in the same circumstances. All was quiet; but

* Kilbagie was the greatest distillery of spirituous liquors at that time in Scotland. There were then so few others, that more usquebae was produced there than at all the rest together. It was not of the best quality; but it was the cheapest to be had—and that was a sufficient reason for its being a favourite with Poosie Nansie's clubs.

it was the quiet of desolation. The whole apartment seemed strewn with the ruins of the human race—"reliquiæ Danaum"—a heterogeneous chaos of carcases, heads, arms, women, children, wooden legs, and other fragments of humanity, together with the no less disabled pieces of Nansie's furniture, that were in every respect analogous to the strange beings who used them on the preceding evening.

Through the course of Sunday, it was observed that the inmates of Nansie's mansion were wonderfully quiet and orderly. If the weather was good, many put off the day by sitting upon turf seats at the door, smoking and talking; while the children lay half naked upon the green, amusing themselves with every species of feat and play, like Nereids sporting on the azure wave. In proportion as the debauch or battle of the preceding evening had been fierce and fatal, the conversations of Sunday were harmonious, and the harmony universal. Whatever were the injuries received in the fray, none of them were remembered. It seemed to be then the general wish that an amnesty should be agreed upon, and no revenge taken for former aggressions. At the close of night, however, the splore was again commenced with considerable briskness. But the festivities of this evening never reached within many degrees of their Saturday night jollifications, in intenseness of enjoyment, or obstreperousness of mirth—partly for the sake of decorum, partly on account of low finances, and principally because their spirits, which, suppressed through the week, burst out into the most violent expression on Saturday night, were so far exhausted by the first overflow, that little material remained to be expended upon the second. On Monday morning, it was a rich sight to see the crapulous wretches take their departure from Mauchline, with empty wallets, sore heads, and sneaking aspects—so completely spent in every respect by the excesses they had committed, that their wretched appearance looked a thousand times more wretched; and what had formerly seemed only ruins of humanity was now the wreck of ruins.

THE ART OF PRINTING.

THE exceedingly ingenious invention of printing with metal types, on paper, was first brought to light in Germany, a country lying near the heart of the Continent of Europe, and most remarkable in the history of mankind for having furnished not only this, but some other very important improvements in the mechanical arts. Until this invention took place, in the course of the fifteenth century, no nation in the world possessed a distinct knowledge of its neighbour, or was even acquainted with its own internal properties. All communications had to be effected by means of writing, or by special messengers, and the knowledge gleaned by one generation ran always a risk of being lost to those which came after it, for want of a permanent medium of communication. To investigate properly, says Hansard, the origin of printing, it is necessary to carry our research to a period far more remote than that at which the art became applicable to the making of books. The early inhabitants of the earth would naturally desire to perpetuate their useful discoveries, as well as the important events of their time; and it may be therefore fairly presumed, that they had some mode of communicating their ideas to succeeding generations before the invention of an alphabet. The scanty traditions received concerning the antediluvians do not enable us to come to any determination relative to their proficiency in communicating the transactions of their time; whether, therefore, they employed stamps of any kind, or had any means whatever of transmitting knowledge, except by oral tradition, we have neither history nor relics to inform us. But that period which immediately followed the deluge, and which some chronologers have termed the second age of the world, affords convincing proofs of the art of forming impressions being then practised; and most probably with a view to propagate science—to inculcate special facts—and as a general means of preserving to posterity certain useful memorials. Purposes such as these, it is reasonable to conclude, were contemplated by the ancient Chaldeans when they stamped, or printed, their tiles or bricks with various figures, hieroglyphics, or inscriptions. In some instances, these ancient specimens seem to have been sun-baked; yet, for the most part, they appear kiln-burnt to a surprising degree of hardness, even to partial vitrification. Of such materials was built the original city and celebrated tower of Babylon; and although a period of four thousand years has rolled away since the construction of the superb metropolis, whose name they bear still, even to the present day do the Babylonian bricks, which have supplied the antiquary and orientalist with so many curious subjects for reflection and discussion, continue to be found. The great city, "whose towers, whose temples, and whose palaces, were built with brick dried in the sun, or baked in the furnace," and whose walls were ornamented with animals modelled to resemble life, richly painted in their natural colours upon the bricks of which they were composed, and into which they were afterwards burnt—what inexhaustible emotions must the spectacle of opulencè presented by the real pile, at the zenith of its glory, have excited! And what must reasoning creatures think of human grandeur, looking now at the bald and desolate site that once boasted such a display of sumptuous edifices—such a gorgeous scene of civic ostentation!

LADY JEAN.

Concluded from No. 1.

WHEN the ceremony was concluded, and both the clergyman and the witnesses had been satisfied and dismissed, the lovers left the house, with the design of walking forwards into the city. In conformity to a previous arrangement, Lady Jean walked first, like a lady of quality, and Richard followed closely behind, with the dress and deportment of her servant. Her ladyship was dressed in her finest suit, and adorned with her finest jewels, all which she had brought from Cumbernauld on purpose, in a mail or leathern trunk—for such was the name then given to the convenience now entitled a portmanteau. Her step was light, and her bearing gay, as she moved along—not on account of the success which had attended her expedition, or her satisfaction in being now united to the man of her choice, but because she anticipated the highest pleasure in the sight of a place whereof she had heard such wonderful stories, and from a participation in whose delights she had been so long withheld. Like all persons educated in the country, she had been regaled in her infancy with magnificent descriptions of the capital—of its buildings, that seemed to mingle with the clouds—its shops, which apparently contained more wealth than all the world beside—of its paved streets (for paved streets were then wonders in Scotland)—and above all, of the grand folks who thronged its Highgates, its Canon-gates, and its Cowgates—people whose lives seemed a perpetual holiday, whose attire was ever new, and who all lived in their several palaces. Though, of course, Edinburgh had then little to boast of, the country people who occasionally visited it did not regard it with less admiration than that with which the peasantry of our own day may be supposed to view it now that it is something so very different. It was then, as well as now, the capital of the country, and, as such, bore the same disproportion in point of magnificence to inferior towns, and to the country in general. In one respect it was superior to what it is at the present day—namely, in being the seat of government and of a court. Lady Jean had often heard all its glorious peculiarities described by her sisters, who, moreover, sometimes took occasion to colour the picture too highly, in order to raise her envy, and make themselves appear great in their alliance and association with so much greatness. She was, therefore, prepared to see a scene of the utmost splendour—a scene in which nothing horrible or paltry mingled, but which was altogether calculated to awe or to delight the senses.

Her ladyship was destined to be disappointed at the commencement, at least, of her acquaintance with the city. The first remarkable object which struck her eye, after leaving the inn, was the high bow, or arch, of the gate called the West Port. In this itself there was nothing worthy of particular attention, and she rather directed her eyes through the opening beneath, which half disclosed a wide space beyond, apparently crowded with people. But when she came close up to the gate, and cast, before passing, a last glance at the arch, she shuddered at the sight then presented to her eyes. On the very pinnacle of the arch was stuck the ghastly and weatherworn remains of a human head, the features of which, half flesh half bone, were shaded and rendered still more indistinctly horrible by the long dark hair, which hung in meagre tresses around them. "Oh, Richard, Richard!" she exclaimed, stopping and turning round, "what is that dreadful-looking thing?" "That, madam," said Richard, without any emotion, "is the broken remnant of a west country preacher, spiked up there to warn his countrymen who may approach this port, against doing any thing to incur the fate which has overtaken himself. Methinks he has preached to small purpose, for yonder stands the gallows, ready, I suppose, to bring him some brother in affliction." "Horrible!" exclaimed Lady Jean; "and is this really the fine town of Edinburgh, where I was taught to expect so many grand sights! I thought it was just one universal palace, and it turns out to be a great charnel-house?" "It is indeed more like that than any thing else at times," said Richard; "but, my dear Lady Jean, you are not going to start at this bugbear, which the very children, you see, do not heed in passing." "Indeed, I think, Richard," answered her ladyship, "if Edinburgh is to be all like this, it would be just as good to turn back at once, and postpone our visit till better times." "But it is not all like this," replied Richard; "I assure you it is not. For heaven's sake, my lady, move on. The people are beginning to stare at us. You shall soon see grand sights enough, if we were once fairly out of this place. Make for the opposite corner of the Grassmarket, and ascend the street to the left of that horrible gibbet. We may yet get past it before the criminals are produced."

Thus admonished, Lady Jean passed, not without a shudder, under the dreadful arch, and entered the spacious oblong square called the Grassmarket. This place was crowded at the west end with rustics engaged in all the bustle of a grain and cattle market, and at the eastern and most distant extremity with a mob of idlers, who had gathered around the gibbet in order to witness the awful ceremony that was about to take place. The crowd, which was scarcely so dense as that which attends the rarer scene of a modern execution, made way on both sides for Lady Jean as she moved along; and wherever she went, she left

behind her a wake, as it were, of admiration and confusion. So exquisite and so new a beauty, so splendid a suit of female attire, and such a stout and handsome attendant—these were all alike calculated to inspire reverence in the minds of the beholders. Her carriage at the same time was so steady and so graceful, that no one could be so rude as to interrupt or disturb it. The people, therefore, parted when she approached, and left a free passage for her on all sides, as if she had been an angel or a spirit come to walk amidst a mortal crowd, and whose person could not be touched, and might scarcely be beheld—whose motions were not to be interfered with by those among whom she chose to walk—but who was to be received with prostration of spirit, and permitted to depart as she had come, unquestioned and unapproached. In traversing the Grassmarket, two or three young coxcombs, with voluminous wigs, short cloaks, rapiers, and rose-knots at their knees and shoes, who, on observing her at a distance, had prepared to treat her with a condescending stare, fell back, awed and confounded, at her near approach, and spent the gaze, perhaps, upon the humbler mark of her follower, or upon vacancy.

Having at length passed the gibbet, Lady Jean began to ascend the steep and tortuous street denominated the West Bow. She had hitherto been unable to direct any attention to what she was most anxious to behold—the scenic wonders of the capital. But having now got clear of the crowd, and no longer fearing to see the gallows, she ventured to lift up her eyes and look around. The tallness and massiveness of the buildings, some of which bore the cross of the Knights Templars on their pinnacles, while others seemed to be surmounted or overtopped by still taller edifices beyond, impressed her imagination; and the effect was rendered still more striking by the countless human figures which crowded the windows, and even the roofs of the houses, all alike bending their attention, as she thought, towards herself. The scene before her looked like an amphitheatre, filled with spectators, while she and Richard seemed as the objects upon the arena. The thought caused her to hurry on, and she soon found herself in a great measure screened from observation by the overhanging projections of the narrower part of the West Bow, which she now entered. With slow and difficult, but stately and graceful steps, she then proceeded, till she reached the upper angle of the street, where a novel and unexpected scene awaited her. A sound like that of rushing waters seemed first to proceed from the part of the street still concealed from her view, and presently appeared round the angle, the first rank of an impetuous crowd, who, rushing downward with prodigious force, would certainly have overwhelmed her delicate form, had she not dexterously avoided them, by stepping aside upon a projecting stair, to which Richard also sprang, just in time to save himself from a similar fate. From this place of safety, which was not without its own crowd of children, women, and sage-looking elderly mechanics, with Kilmarnock cows, both in the next moment saw the massive mob rush past, like the first wave of a flood, bearing either along or down every thing that came in their way. Immediately after, but at a more deliberate pace, followed a procession of figures, which struck the heart of Lady Jean with as heavy a sense of sorrow as the crowd had just impressed with terror and surprise. First came a small company of the veterans of the city guard, some of whom had perhaps figured in the campaigns of Middleton and Montrose, and whose bronzed inflexible faces bore on this melancholy occasion precisely the same expression which they ordinarily exhibited on the joyful one of attending the magistrates at the drinking of the king's health on the 29th of May. Behind these, and encircled by some other soldiers of the same band, appeared two figures of a different sort. One of them was a young looking, but pale and woe-worn man, the impressive wretchedness of whose appearance was strikingly increased by the ghastly dress which he wore. He was attired from head to foot in a white shroud, such as was sometimes worn in Scotland by criminals at the gallows, but which was, in the present instance, partly assumed as a badge of innocence. The excessive whiteness and emaciation of his countenance suited well with this dismal apparel, and, with the wild enthusiasm that kindled in his eyes, gave an almost supernatural effect to the whole scene, which rather resembled a pageant of the dead than a procession of earthly men. He was the only criminal: the person who walked by his side, and occasionally supported his steps, being—as the crowd whispered around, with many a varied expression of sympathy—his father. The old man had the air of a devout Presbyterian, with harsh, intelligent features, and a dress which bespoke his being a countryman of the lower rank. According to the report of the bystanders, he had educated this, his only son, for the unfortunate church of Scotland, and now attended him to the fate which his talents and violent temperament had conspired to draw down upon his head. If he ever felt any pride in the popular admiration with which his son was honoured, no traces of such a sentiment now appeared. On the contrary, he seemed humbled to the very earth with sorrow; and though he had perhaps contemplated the issue now about to take place, with no small portion of satisfaction, so long as it was at a distance and uncertain, the feelings of a father had evidently proved too much for his fortitude, when the event approached in all its dreadful reality. The emotions perceptible in that

rough and rigid countenance were the more striking, as being so much at variance with its natural and characteristic expression; and the tear which gathered in his eye excited the greater commiseration, in so far as it seemed a stranger there. But the hero and heroine of our tale had little time to make observations on this piteous scene, for the train passed quickly on, and was soon beyond their sight. When it was gone, the people of the Bow, who seemed accustomed to such sights, uttered various expressions of pity, indignation, and horror, according to their respective feelings, and then slowly retired to their dens in the stairs and booths which lined the whole of this ancient and singular street.

Lady Jean, whose beautiful eyes were suffused with tears at beholding so melancholy a spectacle, was then admonished by her attendant to proceed. With a heart deadened to all sensations of wonder and delight, she moved forward, and was soon ushered into the place called the Lawnmarket, then perhaps the most fashionable district in Edinburgh, but the grandeur and spaciousness of which she beheld almost without admiration. The scene here was, however, much gay, and approached more nearly to her splendid preconceptions of the capital than any she had yet seen. The shops were, in her estimation, very fine, and some of the people on the street were of that noble description of which she had believed all inhabitants of cities to be. There was no crowd on the street, which, therefore, afforded room for a better display of her stately and beautiful person; and as she walked steadily onwards, still *ush*ed (for such was then the phrase) by her handsome and noble-looking attendant, a greater degree of admiration was excited amongst the gay idlers whom she passed, than even that which marked her progress through the humbler crowd of the Grassmarket. Various noblemen, in passing towards their homes in the Castle Hill, lifted their feathered hats and bowed profoundly to the lovely vision; and one or two magnificent dames, sweeping along with their long silk trains, borne up by liveries, stared at or eyed askance the charms which threw their own so completely into shade. By the time Lady Jean arrived at the bottom of the Lawnmarket, that is to say, where it was partially closed up by the Tolbooth, she had in a great measure recovered her spirits, and found herself prepared to enjoy the sight of the public buildings, which were so thickly clustered together at this central part of the city. She was directed by Richard to pass along the narrow road which then led between the houses and the Tolbooth on the south, and which, being continued by a still narrower passage skirting the west end of St Giles's church, formed the western approach to the Parliament Close. Obeying his guidance in this tortuous passage, she soon found herself at the opening or the square space, so styled on account of its being closed on more than one side by the meeting-place of the legislative assembly of Scotland. Here a splendid scene awaited her. The whole square was filled with the members of the Scottish Parliament, barons and commons, who had just left the house in which they sat together—with ladies, who on days of unusual ceremony were allowed to attend the house—and with horses richly caparisoned, and covered with gold embroidered foot-cloths, some of which were mounted by their owners, while others were held in readiness by footmen. All was bustle and magnificence. Noblemen and gentlemen in splendid attire threaded the crowd in search of their horses; ladies tripped after them with timid and careful steps, endeavouring, by all in their power, to avoid contact with such objects as were calculated to injure their fineries; grooms strode heavily about, and more nimble lacqueys jumped every where, here and there, some of them as drunk as the Parliament Close claret could make them, but all intent on doing the duties of attendance and respect to their masters. Some smart and well-dressed young gentlemen were arranging their cloaks and swords, and preparing to leave the square on foot, by the passage which had given entry to Master Richard and Lady Jean.

At sight of our heroine, most of these gallants stood still in admiration, and one of them, with the trained assurance of a rake, observing her to be beautiful, a stranger, and not too well protected, accosted her in a strain of language which caused her at once to blush and tremble. Richard's brow reddened with anger, as he hesitated not a moment in stepping up and telling the offender to leave the lady alone, on pain of certain consequences which might not prove agreeable. "And who are you, my brave fellow?" said the youth, with bold assurance. "Sirrah!" exclaimed Richard, so indignant as to forget himself, "I am that lady's husband—her servant, I mean;" and here he stopped short in some confusion. "Admirable!" exclaimed the other. "Ha! ha! ha! ha! Here, sirs, is a lady lacquey, who does not know whether he is his mistress's servant or her husband. Let us give him up to the town-guard, to see whether the black-hell will make him remember the real state of the case. So saying, he attempted to push Richard aside and take hold of the lady. But he had not time to touch her garments with so much as a finger, before her protector had a rapier flourishing in his eyes, and threatened him with instant death, unless he desisted from his profane purpose. At sight of the bright steel, he stepped back one or two paces, drew his own sword, and was preparing to fight, when one of his more graceful associates called out, "For shame Rollo!—with a

lady's lacquey, too, and in the presence of the duke and duchess! I see their royal highnesses, already alarmed, are inquiring the cause of the disturbance." It was even as this gentleman said, and presently came up to the scene of contention some of the most distinguished personages in the crowd, one of whom demanded from the parties an explanation of so disgraceful an occurrence. "Why, here is a fellow, my lord," answered Rollo, "who says he is the husband of a lady whom he attends as a liveryman, and a lady, too, the bonniest, I dare say, that has been seen in Scotland since the days of Queen Magdalen!" "And what matters it to you," said the inquirer, who seemed to be a Judge of the Session, "in what relation this man stands to his lady? Let the parties both come forward, and tell their ain tale. May it please your royal highness," he continued, addressing a very grave dignitary who sat on horseback behind him, as stiff and formal as a sign-post, "to hear the *declaratur* of thir twa strange incomers. But see—see—what is the matter with Lord Wigton?" he added, pointing to an aged personage on horseback, who had just pushed forward, and seemed about to faint, and fall from his horse. The person alluded to, at sight of his daughter in this unexpected place, was, in reality, confounded, and it was some time before he mastered voice enough to ejaculate, "O, Jean, Jean! what's this ye've been about? or what has brocht you to Edinburgh?" "And Lord have a care o' us!" exclaimed at this juncture another venerable peer, who had just come up, "what has brocht my sonsie son, Ritchie Livingstone, to Edinburgh, when he should have been fechtin the Dutch by this time in Transylvania?" The two lovers, thus recognised by their respective parents, stood with downcast looks, and perfectly silent, while all was buzz and confusion in the brilliant circle around them; for the parties concerned were not more surprised at the aspect of their affairs, than were all the rest at the beauty of the far-famed, but hitherto unseen, Lady Jean Fleming. The Earl of Linlithgow, Richard's father, was the first to speak aloud, after the general astonishment had for some time subsided; and this he did in a laconic though important query, which he couched in the simple words, "Are you married, bairns?" "Yes, dearest father," said his son, gathering courage, and coming close up to his saddle-bow; "and I beseech you to extricate Lady Jean and me from this crowd, and I shall tell you all when we are alone." "A pretty man ye are, truly," said the old man, who never took any thing very seriously to heart, "to be staying at hame, and getting yourself married, all the time you should have been abroad, winning honour and wealth, as your gallant granduncle did, wi' Gustavus i' the thretties! However, since better mayna be, I maun try and console my Lord Wigton, who, I doot, has the worst o' the bargain, ye ne'er do weel!" He then went up to Lady Jean's father, shook him by the hand, and said, "that though they had been made relations against their wills, he hoped they would continue good friends. The young people," he observed, "are no that ill-matched; and it is not the first time that the Flemings and the Livingstones have melled together, as witness the blythe marriage of the Queen's Marie to Lord Fleming, in the fifteen-sixty-five. At ony rate, my lord, let us put a good face on the matter, afore thae glowing gentles, and whizzer-snapper duchesses. I'll get horses for the two, and they'll join the ridin' down the street; and de'il ha'e me, if Lady Jean disna outshine them, the hale o' them!" "My Lord Linlithgow," responded the graver and more implacable Earl of Wigton, "it may set you to take this matter blythely; but, let me tell you, it's a muckle mair serious affair for me. What think ye am I to do wi' Kate and Grizzly noo?" "Hoot, toot, my lord," said Linlithgow, with a sly smile, "their chance is as gude as ever it was, I assure you, and sae will every body think that kens them. *I maun ca'* horses though, or the young folk will be ridden over, afore ever they do mair gude, by thae rampaugin' young men." So saying, and taking Lord Wigton's moody silence for assent, he proceeded to cry to his servants for the best pair of horses they could get; and these being speedily procured, Lord Richard and his bride were requested to mount; after which they were formally introduced to the gracious notice of the Duke and Duchess of York, and the Princess Anne, who happened to attend Parliament on this the last day of its session, when it was customary for all the members to ride both to and from the house in an orderly cavalcade. The order was now given to proceed, and the lovers were soon relieved, in a great measure, from the embarrassing notice of the crowd, by assuming a particular place in the procession, and finding themselves confounded with more than three hundred equally splendid figures. As the pageant, however, moved down the High Street, in a continuous and open line, it was impossible not to distinguish the singular loveliness of Lady Jean, and the gallant carriage of her husband, from all the rest. Accordingly, the very trained bands and city guard, who lined the street, and who were in general quite as insensible to the splendours of the *Riding*, as are the musicians in a modern orchestra to the wonders of a melodrama in its fortieth night—even they perceived and admired the graces of the young couple, whom they could not help gazing after with a stupid and lingering delight. From the windows, too, and the *stair-heads*, their beauty was well observed, and amply conjectured and commented on; while many a young cavalier endea-

voured, by all sorts of pretences, to find occasion to break the order of the cavalcade, and get himself haply placed nearer to the exquisite figure, of which he had got just one killing glance in the square. Slowly and majestically the brilliant train paced down the great street of Edinburgh—the acclamations of the multitude ceaselessly expressing the delight which the people of Scotland felt in this sensible type and emblem of their ancient independence. At length they reached the court-yard of Holyrood-house, where the duke and duchess invited the whole assemblage to a ball, which they designed to give that evening in the hall of the palace; after which, all departed to their respective residences throughout the town, Lords Wigton and Linlithgow taking their young friends under their immediate protection, and seeking the residence of the former nobleman, a little way up the Canongate. In riding thither, the lovers had leisure to explain to their parents the singular circumstances of their union, and address enough to obtain unqualified forgiveness for their imprudence. On alighting at Lord Wigton's house, Lady Jean found her sisters confined to their rooms with headaches, or some such serious indisposition, and in the utmost dejection on account of having been thereby withheld from the Riding of the Parliament. Their spirits, as may be supposed, were not much elevated, when, on coming forth in dishabille to welcome their sister, they found she had had the good fortune to be married before them. Their ill luck was, however, irremediable; and so, making a merit of submitting to it, they condescended to be rather agreeable during the dinner and the afternoon. It was not long before all parties were perfectly reconciled to what had taken place; and by the time it was necessary to dress for the ball, the elder young ladies declared themselves so much recovered as to be able to accompany their happy sister. The Earl of Linlithgow and his son then sent a servant for proper dresses, and prepared themselves for the occasion without leaving the house. When all were ready, a number of chairs were called to transport their dainty persons down the street. The news of Lady Jean's arrival and of her marriage having now spread abroad, the court in front of the house, the alley, and even the open street, were crowded with people of all ranks, anxious to catch a passing glimpse of the heroine of so strange a tale. As her chair was carried along, a buzz of admiration from all who were so happy as to be near it, marked its progress. Happy, too, was the gentleman who had the good luck to be near her chair as it was set down at the palace gate, and assist her in stepping from it upon the lighted pavement. From the outer gate, along the piazza of the inner court, and all the way up the broad staircase to the illuminated hall, two rows of noblemen and gentlemen formed a brilliant avenue, as she passed along, while an hundred plumed caps were doffed in honour of so much beauty, and as many youthful eyes glanced bright with satisfaction at beholding it. The object of all this attention tripped modestly along in the hand of the Earl of Linlithgow, acknowledging, with many a graceful flexure and undulation of person, the compliments of the spectators. At length the company entered the spacious and splendid room in which the ball was to be held. At the extremity opposite to the entry, upon an elevated platform, sat the three royal personages, all of whom, on Lady Jean's introduction, rose and came forward to welcome her and her husband to the entertainments of Holyrood, and to hope that her ladyship would often adorn their circle. In a short time the dancing commenced; and amidst all the ladies who exhibited their charms and their magnificent attire in that captivating exercise, who was, either in person or dress, half so brilliant as Lady Jean?

OLD SCOTTISH MODE OF DISCOVERING MURDER.

In tracing the customs of our ancestors, we alternately pity their superstitious usages, and are amused at the credulity of the legislature, in continuing absurdities which would now be scoffed at even by children. There was a superstitious notion once exceedingly prevalent, regarding the discovery of the murderer by the touch of the dead body. In Germany, this experiment was called *bahr recht*, or the law of the bier, because, the murdered body being stretched upon a bier, the suspected person was obliged to put one hand upon the wound, and the other upon the mouth of the deceased, and in that posture call upon heaven to attest his innocence. If during this ceremony the blood gushed from the mouth, nose, or wound, a circumstance not unlikely to happen in the course of shifting or stirring the body, it was held sufficient evidence of the guilt of the party. The same singular kind of evidence was admitted in the Scottish criminal courts, at the short distance of little more than a century. Fountainhall relates a most dreadful instance of this perversion of jurisprudence. The case was that of Philip Stanfield, tried upon the 30th November 1687, for cursing his father (which by the Scottish law is a capital crime, act 1661, chap. 20), and for being accessory to the murder. Sir James Stanfield, the deceased, was a person of melancholy temperament; so that, when his body was found in a pond near his own house of Newmilns, he was at first generally supposed to have drowned himself. But the body having been hastily buried, a report arose that he had been strangled by ruffians, insti-

gated by his son Philip, a profligate youth, whom he had disinherited on account of his gross debauchery. Upon this rumour the Privy Council granted warrant to two surgeons of character, named Crawford and Muirhead, to dig up the body, and to report the state in which they should find it. Philip was present on this occasion, and the evidence of both surgeons bears distinctly, that he stood for some time at a distance from the body of his parent; but being called upon to assist in stretching out the corpse, he put his hand to the head, when the mouth and nostrils instantly gushed with blood. This circumstance, with the evident symptoms of terror and remorse exhibited by young Stanfield, seems to have had considerable weight with the jury, and is thus stated in the indictment:—"That his (the deceased's) nearest relatives being required to lift the corpse into the coffin, after it had been inspected, upon the said Philip Stanfield touching of it (*according to God's usual mode of discovering murder*), it bled afresh upon the said Philip; and that thereupon he let the body fall, and fled from it in the greatest consternation, crying, 'Lord have mercy upon me!'" The prisoner was found guilty of being accessory to the murder of his father, although there was little more than strong presumptions against him. It is true, he was at the same time separately convicted of the distinct crimes of having cursed his father, and drunk damnation to the monarchy and hierarchy. His sentence, which was to have his tongue cut out, and hand struck off, previous to his being hanged, was executed with the utmost rigour. He denied the murder with his last breath. "It is," says a contemporary judge, "a dark case of divination, to be remitted to the great day, whether he was guilty or innocent. Only, it is certain he was a bad youth, and may serve as a beacon to all profligate persons."

BIOGRAPHIC SKETCHES.

JAMES FERGUSON

In the first number of the Journal, I presented a sketch of the life and character of our late distinguished townsman, Dr Adam, in whom *genius* was early manifested, and ultimately rewarded. I may now offer a similar biographic sketch of our illustrious countryman, James Ferguson, the Astronomer. These I hold up to my juvenile friends as patterns truly worthy of their imitation; and fully impressed with the conviction that such sketches may be found beneficial, I shall, in the language of the author of a work entitled "the Pursuit of Knowledge under Difficulties," continue to select, from the records of philosophy, literature, and art, in all ages and countries, a body of examples, to show how the most unpropitious circumstances have been unable to conquer an ardent desire for the acquisition of knowledge. Every man has difficulties to encounter in this pursuit; and, therefore, every man is interested in learning what are the real hindrances which have opposed themselves to the progress of some of the most distinguished persons, and how those obstacles have been surmounted. The love of knowledge will of itself do a great deal towards its acquisition; and if it exist with that force and constancy which it exhibits in the characters of all truly great men, it will induce that ardent but humble spirit of observation and inquiry, without which there can be no success.

"Among self-educated men there are few who claim more of our admiration than the celebrated James Ferguson. If ever any one was literally his own instructor in the very elements of knowledge, it was he. Acquisitions that have scarcely in any other case, and, probably, never by one so young, been made without the assistance either of books or a living teacher, were the discoveries of his solitary and almost illiterate boyhood. There are few more interesting narratives in any language than the account which Ferguson himself has given of his early history. He was born in the year 1710, a few miles from the village of Keith, in Banffshire; his parents, as he tells us, being in the humblest condition of life (for his father was merely a day-labourer), but religious and honest. It was his father's practice to teach his children himself to read and write, as they successively reached what he deemed the proper age; but James was too impatient to wait till his regular turn came. While his father was teaching one of his elder brothers, James was secretly occupied in listening to what was going on; and, as soon as he was left alone, used to get hold of the book, and work hard in endeavouring to master the lesson which he had thus heard gone over. Being ashamed, as he says, to let his father know what he was about, he was wont to apply to an old woman who lived in a neighbouring cottage to solve the difficulties. In this way he actually learned to read tolerably well before his father had any suspicion that he knew his letters. His father, at last, very much to his surprise, detected him one day reading by himself, and thus found out his secret.

When he was about seven or eight years of age, a simple incident occurred, which seems to have given his mind its first bias to what became afterwards its favourite kind of pursuit. The roof of the cottage having partially fallen in, his father, in order to raise it again, applied to it a beam, resting on a prop in the manner of a lever, and was thus enabled, with comparative ease, to produce what seemed to his son quite a stupendous effect. The circumstance set our young philosopher-a-thinking; and after a while, it struck him that his father, in using the beam, had applied his

strength to its extremity; and this, he immediately concluded, was probably an important circumstance in the matter. He proceeded to verify his notion by experiment; and having made several levers, which he called bars, soon not only found that he was right in his conjecture as to the importance of applying the moving force at the point most distant from the fulcrum, but discovered the rule, or law of the machine, namely, that the effect of any form or weight made to bear upon it is always exactly proportioned to the distance of the point on which it rests from the fulcrum. 'I then,' says he, 'thought that it was a great pity that by means of this bar a weight could be raised but a very little way. On this, I soon imagined that, by pulling round a wheel, the weight might be raised to any height, by tying a rope to the weight, and winding the rope round the axle of the wheel; and that the power gained must be just as great as the wheel was broader than the axle was thick; and found it to be exactly so, by hanging one weight to a rope put round the wheel, and another to the rope that coiled round the axle.' The child had thus, it will be observed, actually discovered two of the most important elementary truths in mechanics—the lever and the wheel and axle. He afterwards hit upon others; and all the while, he had not only possessed neither book nor teacher to assist him, but was without any other tools than a simple turning-lathe of his father's, and a little knife wherewith to fashion his blocks and wheels, and the other contrivances he needed for his experiments. After having made his discoveries, however, he next, he tells up, proceeded to write an account of them; thinking his little work, which contained sketches of the different machines drawn with a pen, to be the first treatise ever composed of the sort. When, some time after, a gentleman showed him the whole in a printed book, although he found that he had been anticipated in his inventions, he was much pleased, as he was well entitled to be, on thus perceiving that his unaided genius had already carried him so far into what was acknowledged to be the region of true philosophy.

It is a ludicrous blunder that the French astronomer, Lalande, makes, in speaking of Ferguson, when he designates him as '*Berger au Roi d'Angleterre en Ecosse*,' the King of England's Shepherd for Scotland. He had no claim to this pompous title; but it is true that he spent some of his early years as a keeper of sheep, though in the employment not of the state, but of a small farmer in the neighbourhood of his native place. He was sent to this occupation, he tells us, as being of weak body; and while his flock was feeding around him, he used to busy himself in making models of mills, spinning-wheels, &c. during the day, and in studying the stars at night, like his predecessors of Chaldea. When a little older, he went into the service of another farmer, a respectable man called James Glashan, whose name well deserves to be remembered. After the labours of the day, young Ferguson used to go at night to the fields, with a blanket about him, and a lighted candle, and there, laying himself down on his back, pursued, for long hours, his observations on the heavenly bodies. 'I used to stretch,' says he, 'a thread, with small beads on it, at arm's length, between my eye and the stars, sliding the beads upon it, till they hid such and such stars from my eye, in order to take their apparent distances from one another; and then laying the thread down on a paper, I marked the star thereon by the beads. My master,' he adds, 'at first laughed at me; but when I explained my meaning to him, he encouraged me to go on; and that I might make fair copies in the daytime of what I had done in the night, he often worked for me himself. I shall always have a respect for the memory of that man.' Having been employed by his master to carry a message to Mr Gilchrist, the minister of Keith, he took with him the drawings he had been making, and showed them to that gentleman. Mr Gilchrist upon this put a map into his hands, and having supplied him with compasses, ruler, pens, ink, and paper, desired him to take it home with him, and bring back a copy of it. 'For this pleasant employment,' says he, 'my master gave me more time than I could reasonably expect, and often took the thrashing-flail out of my hands, and worked himself, while I sat by him in the barn, busy with my compasses, ruler, and pen.' This is a beautiful, we may well say, and even a touching picture—the good man so generously appreciating the worth of knowledge and genius, that, although the master, he voluntarily exchanges situations with his servant, and insists upon doing the work that must be done, himself, in order that the latter may give his more precious talents to their more appropriate vocation. We know not that there is on record an act of homage to science and learning more honourable to the author.

Having finished his map, Ferguson carried it to Mr Gilchrist's, and there he met Mr Grant of Achonamey, who offered to take him into his house, and make his butler give him lessons. 'I told Squire Grant,' says he, 'that I should rejoice to be at his house, as soon as the time was expired for which I was engaged with my present master. He very politely offered to put one in my place, but this I declined.' When the period in question arrived, accordingly, he went to Mr Grant's, being now in his twentieth year. Here he found both a good friend and a very extraordinary man in Cantley, the butler, who had first fixed his attention, by a sun-dial which

he happened to be engaged in painting on the village school-house, as Ferguson was passing along the road, on his second visit to Mr Gilchrist. Dialling, however, was only one of the many accomplishments of this learned butler, who, Ferguson assures us, was profoundly conversant both with arithmetic and mathematics; played on every known musical instrument except the harp; understood Latin, French, and Greek; and could let blood, and prescribe for diseases. These multifarious attainments he owed, we are told, entirely to himself and to nature; on which account Ferguson designates him 'God Almighty's scholar.'

From this person Ferguson received instructions in decimal fractions and algebra, having already made himself master of vulgar arithmetic, by the assistance of books. Just as he was about, however, to begin geometry, Cantley left his place for another in the establishment of the Earl of Fife, and his pupil thereupon determined to return home to his father.

Cantley, on parting with him, had made him a present of a copy of Gorton's Geographical Grammar. The book contains a description of an artificial globe, which is not, however, illustrated by any figure. Nevertheless, 'from this description,' says Ferguson, 'I made a globe in three weeks at my father's, having turned the ball thereof out of a piece of wood; which ball I covered with paper, and delineated a map of the world upon it; made the meridian ring and horizon of wood, covered them with paper, and graduated them; and was happy to find, that, by my globe (which was the first I ever saw) I could solve the problems.'

For some time after this, he was very unfortunate. Finding that it would not do to remain idle at home, he engaged in the service of a miller in the neighbourhood, who, feeling, probably, that he could trust to the honesty and capacity of his servant, soon began to spend all his own time in the alehouse, and to leave poor Ferguson at home, not only with every thing to do, but with very frequently nothing to eat. A little oatmeal, mixed with cold water, was often, he tells us, all he was allowed. Yet in this situation he remained a year, and then returned to his father's, very much the weaker for his fasting. His next master was a Dr Young, who, having induced him to enter his service by a promise to instruct him in medicine, not only broke his engagement as to this point, but used him in other respects so tyrannically, that, although engaged for half a year, he found he could not remain beyond the first quarter; at the expiration of which, accordingly, he came away without receiving any wages, having 'wrought for the last fortnight,' says he, 'as much as possible with one hand and arm, when I could not lift the other from my side.' This was in consequence of a severe hurt he had received, which the doctor was too busy to look to, and by which he was confined to his bed for two months after his return home.

Reduced as he was, however, by exhaustion and actual pain, he could not be idle. 'In order,' says he, 'to amuse myself in this low state, I made a wooden clock, the frame of which was also of wood, and it kept time pretty well. The bell on which the hammer struck the hours, was the neck of a broken bottle.' A short time after this, when he had recovered his health, he gave a still more extraordinary proof of his ingenuity, and the fertility of his resources for mechanical invention, by actually constructing a time-piece, or watch, moved by a spring. But we must allow him to give the history of this matter in his own words.

'Having then,' he says, 'no idea how any time-piece could go but by a weight and a line, I wondered how a watch could go in all positions, and was sorry that I had never thought of asking Mr Cantley, who could very easily have informed me. But happening one day to see a gentleman ride by my father's house (which was close by a public road), I asked him what o'clock it then was. He looked at his watch, and told me. As he did that with so much good nature, I begged of him to show me the inside of his watch; and though he was an entire stranger, he immediately opened the watch, and put it into my hands. I saw the spring-box with part of the chain round it, and asked him what it was that made the box turn round. He told me that it was turned round by a steel spring within it. Having then never seen any other spring than that of my father's gun-lock, I asked how a spring within a box could turn the box so often round as to wind all the chain upon it? He answered, that the spring was long and thin; that one end of it was fastened to the axis of the box, and the other end to the inside of the box; that the axis was fixed, and the box was loose upon it. I told him that I did not yet thoroughly understand the matter. 'Well, my lad,' says he, 'take a long thin piece of whalebone, hold one end of it fast between your finger and thumb, and wind it round your finger; it will then endeavour to unwind itself; and if you fix the other end of it to the inside of a small hoop, and leave it to itself, it will turn the hoop round and round, and wind up a thread tied to the outside of the hoop.' I thanked the gentleman, and told him that I understood the thing very well. I then tried to make a watch with wooden wheels, and made the spring of whalebone, but found that I could not make the wheel go when the balance was put on, because the teeth of the wheels were rather too weak to bear the force of a spring sufficient to move the balance, although the wheels would run fast enough when the balance was taken off. I

enclosed the whole in a wooden case, very little bigger than a breakfast teacup; but a clumsy neighbour one day looking at my watch, happened to let it fall, and, turning hastily about to pick it up, set his foot upon it, and crushed it all to pieces; which so provoked my father, that he was almost ready to beat the man, and discouraged me so much, that I never attempted to make such another machine again, especially as I was thoroughly convinced I could never make one that would be of any real use.'

What a vivid picture is this of an ingenious mind thirsting for knowledge! and who is there, too, that does not envy the pleasure that must have been felt by the courteous and intelligent stranger by whom the young mechanician was carried over his first great difficulty, if he ever chanced to learn how greatly his unknown questioner had profited from their brief interview? That stranger might probably have read the above narrative, as given to the world by Ferguson, after the talents which this little incident probably contributed to develop, had raised him from his obscurity to a distinguished place among the philosophers of his age; and if he did know this, he must have felt that encouragement in well-doing which a benevolent man may always gather, either from the positive effects of acts of kindness upon others, or their influence upon his own heart. Civility, charity, generosity, may sometimes meet an ill return, but one person *must* be benefited by their exercise: the kind heart has its own abundant reward, whatever be the gratitude of others. The case of Ferguson shows that the seed does not always fall on stony ground. It may appear somewhat absurd to dwell upon the benefit of a slight civility, which cost, at most, but a few minutes of attention; but it is really important that those who are easy in the world—who have all the advantages of wealth and knowledge at their command—should feel of how much value is the slightest encouragement and assistance to those who are toiling up the steep of emulation. 'Too often "the scoff of pride" is superadded to the "bar of poverty," and thus it is that many a one of the best talents and the most generous feelings

"Has sunk into the grave, unpitied and unknown,"

because the wealthy and powerful have never understood the value of a helping hand to him who is struggling with fortune."—*Library of Entertaining Knowledge.*

[Such is the history of Ferguson's struggles in the early part of his life. He afterwards applied himself, apparently without the least effort, to the business of portrait-painting, by which he subsisted for several years in Edinburgh and London; till finally his philosophical powers obtained the notice and patronage which they deserved, and he stood forth one of the first men of the age. His numerous publications are well known, and have been translated into most of the European languages. He died in 1776, having for some years enjoyed a pension from George III., whose beneficence to men of science has conferred great lustre upon his reign, as well as upon his own private character.]

A SEA-FIGHT BETWEEN THE BRITISH AND FRENCH.

ON the 30th of December 1794, the British twelve-pounder, thirty-two gun frigate, *Blanche*, Captain Robert Faulknor, cruising off the island of Désirade, one of the dependencies of Guadaloupe, and in French possession, chased a large French armed schooner, under the fort at the bottom of the bay. This being accomplished, "the *Blanche*, at about 6 p. m., steered straight for Pointe-à-Pitre, and, on arriving within four miles of the port, lay to for the night. On the next day, the 4th, at daybreak, the *Blanche* discovered the *Pique* lying at anchor just outside of the harbour. At about 8 h. 30 m. the *Blanche* made sail to meet the French ship and schooner, until nearly within gunshot of Fort Fleur-d'Épée; when finding the *Pique* apparently disinclined to come out from the batteries, the *Blanche*, who had hove to, made sail to board a schooner running down along Grande-terre. At this time Pointe-à-Pitre bore from the *Blanche* north-west, distant two leagues, and the French frigate north-north-west, distant three miles.

At half-past noon, the *Pique* filled, and made sail towards the *Blanche*. At 2 p. m., the *Pique* crossed the *Blanche* on the opposite tack, and, hoisting French colours, fired four shots at her. This challenge, as it might be considered, the British frigate answered, by firing a shot to windward. The battery at Gosier also fired two shots; but they, like those of the frigate, fell short. At 2 h. 30 m. p. m., finding that the *Pique* had tacked, and was standing towards her, the *Blanche* shortened sail for the French frigate to come up; but at 3 h. 30 m. p. m., the latter tacked and stood away.

In hope to induce the *Pique* to follow her, the *Blanche*, under topsails and courses, stood towards Marie-Galante. At 7 p. m., observing the *Pique* sail under Grande-terre, Captain Faulknor took out the American crew from the schooner, and sent on board a petty officer and party of men. The *Blanche* then wore, and stood towards the island of Dominique, with the schooner in tow. At about 8 p. m., the French frigate was descried astern, about two leagues distant, standing after the *Blanche*. The latter immediately cast off the schooner, and, tacking, made all sail in chase.

At about a quarter past midnight, the *Blanche*, on the starboard tack, passed under the lee of the *Pique* on the larboard tack, and returned the distant broadside which the *Pique* had fired at her. At half-past midnight, having got nearly in the wake of her opponent, the *Blanche* tacked, and, at a few minutes before 1 A. M., on the 5th, just as she had arrived within musket-shot upon the starboard quarter of the *Pique*, the latter wore, with the intention of crossing her opponent's hawse, and raking her ahead. To frustrate this manœuvre, the *Blanche* wore also; and the two frigates became closely engaged, broadside to broadside.

At about 2 h. 30 m. A. M., the *Blanche*, having shot ahead, was in the act of luffing up to port, to rake the *Pique* ahead, when the former's wounded mizen and mainmasts, in succession, fell over the side. Almost immediately after this, the *Pique* ran foul of the *Blanche* on her larboard quarter, and made several attempts to board. These attempts the British crew successfully resisted; and the larboard quarter-deck guns, and such of the main-deck ones as would bear, were fired with destructive effect into the *Pique*'s starboard bow; she returning the fire from her tops, as well as from some of her quarter-deck guns, run in amid-ships fore and aft. At a few minutes before 3 A. M., while assisting his second lieutenant, Mr David Milne, and one or two others of his crew, in lashing, with such ropes as were handy, the bowsprit of the *Pique* to the capstan of the *Blanche*, preparatory to a more secure fastening, by means of a hawser, which was getting up from below, the young and gallant Captain Faulknor fell by a musket-ball through his heart.

At this moment, or very soon afterwards, the lashings broke loose; and the *Pique*, crossing the stern of the *Blanche*, who had now begun to pay off for the want of after-sail, fell on board the latter, a second time, upon the starboard quarter. In an instant, the British crew, with the hawser which just had before been got on deck, lashed the bowsprit of the *Pique* to the stump of their own mainmast. In this manner, the *Blanche*, commanded now by Lieutenant Frederick Watkins, towed before the wind her resolute opponent, whose repeated attempts to cut away this second lashing were defeated by the quick and well-directed fire of the British marines. In the meanwhile, the constant stream of musketry poured upon the quarter-deck of the *Blanche*, from the fore-castle and tops of the *Pique*, and a well-directed fire from the latter's quarter-deck guns, pointed forward, gave great annoyance to the former; particularly as, having, like many other ships in the British navy at this period, no stern-ports on the main-deck, the cannonade on the part of the *Blanche* was confined to two quarter-deck six-pounders. The carpenters having in vain tried to cut down the upper transom beam, no alternative remained but to blow away a part of it on each side. As soon, therefore, as the firemen with their buckets were assembled in the cabin, the two after-guns were pointed against the stern-frame. The discharge made a clear breach on both sides, and the activity of the bucket-men quickly extinguished the fire it had occasioned in the woodwork. The two twelve-pounders of the *Blanche*, thus brought into use, soon played havoc upon the *Pique*'s decks.

At about 3 h. 15 m. A. M., the mainmast of the French frigate (her fore and mizenmast having previously come down) fell over the side. In this utterly defenceless state, without a gun, which, on account of the wreck of her masts, she could now bring to bear, the *Pique* sustained the raking fire of the *Blanche* until 5 h. 15 m. A. M.; when some of the French crew, from the bowsprit end, called aloud for quarter. The *Blanche* immediately ceased her fire; and every boat in both vessels having been destroyed by shot, Lieutenant Milne, followed by ten seamen, endeavoured to reach the prize by means of the hawser that still held her; but their weight bringing the bight of the rope down in the water, they had to swim a part of the distance.

The *Blanche*, besides her 32 long 12 and 6-pounders, mounted six 18-pounder carronades, total, 38 guns; and having sent away in prizes two master's mates and 12 seamen, she had on board no more than 198 men and boys. Of these, the *Blanche* lost her commander, one midshipman, five seamen, and one private marine killed; one midshipman, two quartermasters, the armourer, one sergeant of marines, twelve seamen, and four private marines, wounded; total, eight killed and twenty-one wounded.

The *Pique* was armed with two carriage-guns, 6-pounders, less than her establishment, or 38 in all; but she mounted, along her gunwale on each side, several brass swivels. Respecting the number composing the crew of the *Pique*, the accounts are very contradictory. Lieutenant Watkins, in his official letter, states the number at 360; and Vice-Admiral Caldwell, at Martinique, when enclosing that letter to the Admiralty, says, 'many more than 360.' On the other hand, the three French officers, examined before the surrogate of the colonial vice-admiralty court, subsequently deposed, two of them, to 'between 260 and 270 men,' and the third, to 'about 270 men,' as the total number on board their ship when the action commenced. Upon these certificates, head-money was paid for 265 men; but according to the documents transmitted along with those certificates, the actual number of men on board was 279."—*James's Naval History*.

EMIGRATION.

"I HAVE said nothing," continues Mr Fergusson, "hitherto of the price or value of land in Canada, and it is extremely difficult, in the settled parts of either province, to ascertain any thing like a fair average rate. Prices are perpetually fluctuating, and must be regulated by the circumstances of the seller; one man being willing to sell his farm for five dollars an acre, under a strong desire to commence anew upon a forest tract, or labouring under necessity, while his next neighbour may probably refuse to part with similar land for less than ten or twelve dollars per acre. Of this, however, there is no doubt, that very eligible and advantageous purchases may at all times be made by a prudent capitalist, and that land is every year increasing in value, wherever it is desirable to possess it. Great bargains are sometimes obtained at public sales, by warrant of the sheriff, for payment of land taxes. Land thus sold is subject, for a certain short period, to be redeemed by the individual, or his heirs, who originally obtained the grant; but as it seldom exceeds, at a sheriff sale, 6d. or 7d. per acre, it is well worthy of a trial. Steam navigation may be said to have been created for America, and it is difficult to estimate the advances which the States and the Canadas will soon make under its influence. To emigrants it not only affords a safe, cheap, and agreeable conveyance, but from the large concourse of passengers, a fund of valuable local information may always be procured, and useful acquaintances formed; while it is impossible to overlook the silent but important effects, in clearing the forest, which the consumption of fuel on board the steam-boats is destined to accomplish. Perhaps it is not fanciful to assert that the woods of America are now actually clearing by means of steam.

York, the capital of Upper Canada, and seat of government, is a very desirable station for a settler to choose as head-quarters, in looking about for a purchase. He is sure, at this place, to meet with numerous offers of farms, regarding which he will do well to act with caution; and he will be able to inspect the plans of public lands in the government land-office, under the superintendence of Mr P. Robinson, a gentleman able and willing to afford him every facility. The rich and heavy land of Upper Canada is not to be found in general upon the immediate banks of the lakes and rivers. It lies, for the most part, from twelve to twenty miles back, and thus compensates the enterprising settler for plunging into the forest. Government have still, I believe, about four millions and a half of acres to dispose of, besides seven or eight millions more, beyond the lines of what has been surveyed. No land is now granted to individuals without payment, the price varying according to situation and quality, and subject to the regulation of clearing and fencing five acres within two years, erecting a house sixteen feet by twenty, and also clearing half of the road in front.

Another land-office, highly interesting to emigrants, is likewise to be found in York. It is here that the commissioners of the Canada Company reside, and have their principal establishment. This Company, as is well known, purchased from government two and a half millions of acres in the Upper Province, with the view of disposing of it in lots to settlers, at an advanced price. The Company is yet too much in its infancy to speculate upon results; but no reasonable doubt can be entertained that it must operate favourably in procuring settlers.

A great progress has been made in the formation of roads, bridges, mills, &c., which government would not, and private individuals could not, have effected in the short period which had elapsed since the establishment of the Company; and although a feeling inimical to their measures showed itself in some quarters, I confess myself unable to discover for that jealousy any reasonable cause. I had very full discussions with the commissioners and agents, from which, as well as from their published proposals, I feel satisfied that emigrants of every class may commit themselves to the Canada Company, in perfect assurance of experiencing the most kind, honourable, and liberal treatment. Circumstances dependent upon the state of a new country may delay the execution of plans beyond the promised period; but there can be no doubt of the Company fulfilling all their engagements as speedily as possible. The prices of land vary from 7s. 6d. to 15s. per acre. I was much impressed with a favourable opinion of the Great Huron Tract, from the fact that many steady Dutch settlers, in the possession of old productive farms near York, were, at the period of my visit, disposing of their property and removing to Goderich—a change which the calculating Dutchman would not have readily adopted, without pretty reasonable prospects of bettering himself to a considerable amount. The township of Goderich contains about four hundred inhabitants already, and several Dutch families from the neighbourhood of York have sold, or are endeavouring to sell, their cultivated and valuable farms, and have purchased lands from the Company in the Huron Tract. About 6000 acres have been sold them in the neighbourhood of Goderich within the last six months. In Guelph a very valuable mill has lately been erected, and one in Goderich is now in progress.

In a young and thinly-settled country such as Canada, every accession of an industrious family or individual tends to the welfare of all; and it is there-

fore natural to suppose that such a corporation as the Canada Company would be fully awake to this principle. We find, accordingly, that in forming arrangements for forwarding emigrants to their own lands, they have offered very favourable proposals to emigrants at large. They state, that 'all persons depositing £20 with the Canada Company's agents in Quebec and Montreal, will be forwarded to the head of Lake Ontario by steam-boats, free of expense, and have liberty to select land in any part of the province, at the current price charged by the Company, when the whole amount of their deposit will be placed to their credit on account of their land. But should they prefer purchasing from individuals, and not the Company, then the expense of their conveyance will be deducted from the amount deposited, and the balance paid over to them. Persons depositing a sum equal to their conveyance, with their families and luggage, from Quebec to the head of the lake, may avail themselves of the Company's contracts with the forwarders; and should they, within three months after arrival, select land in Guelph, and pay one-fifth of the purchase-money, then the amount of their deposit in Quebec will also be placed to their credit, and they, their families, &c. be thus conveyed from Quebec free of expense.'—*Agricultural Journal*.—*To be continued*.

ON THE STUDY OF NATURAL PHILOSOPHY.

THE situation of man on the globe he inhabits, and over which he has obtained the control, is in many respects exceedingly remarkable. Compared with its other denizens, he seems, if we regard only his physical constitution, in almost every respect their inferior, and equally unprovided for the supply of his natural wants, and his defence against the innumerable enemies which surround him. No other animal passes so large a portion of its existence in a state of absolute helplessness, or falls in old age into such protracted and lamentable imbecility. To no other warm-blooded animal has nature denied that indispensable covering, without which, the vicissitudes of a temperate, and the rigours of a cold, climate, are equally insupportable; and to scarcely any has she been so sparing in external weapons, whether for attack or defence. Destitute alike of speed to avoid, and of arms to repel the aggressions of his voracious foes; tenderly susceptible of atmospheric influences, and unfitted for the coarse ailments which the earth affords spontaneously, during at least two-thirds of the year, even in temperate climates—man, if abandoned to mere instinct, would be of all creatures the most destitute and miserable. Distracted by terror, and goaded by famine; driven to the most abject expedients for concealment from his enemies, and to the most cowardly devices for the seizure and destruction of his nobler prey, his existence would be one continued subterfuge or stratagem; his dwelling would be in dens of the earth, in clefts of rocks, or in the hollow of trees; his food worms and the lower reptiles, or such few and crude productions of the soil as his organs could be brought to assimilate, varied with occasional relics, mangled by more powerful beasts of prey, or contemned by their more pampered choice. Remarkable only for the absence of those powers and qualities which obtain for other animals a degree of security and respect, he would be disregarded by some, and hunted down by others, till after a few generations his species would become altogether extinct, or, at best, would be restricted to a few islands in tropical regions, where the warmth of the climate, the paucity of enemies, and the abundance of vegetable food, might permit it to linger.

Yet man is the undisputed lord of the creation. The strongest and fiercest of his fellow-creatures—the whale, the elephant, the eagle, and the tiger—are slaughtered by him to supply his most capricious wants, or tamed to do him service, or imprisoned to make him sport. The spoils of all nature are in daily requisition for his most common uses, yielded with more or less readiness, or wrested with reluctance from the mine, the forest, the ocean, and the air. Such are the first fruits of reason. Were they the only or the principal ones, were the mere acquisition of power over the materials, and the less gifted animals which surround us, and the consequent increase of our external comforts, and our means of preservation and sensual enjoyment, the sum of the privileges which the possession of this faculty conferred, we should, after all, have little to plume ourselves upon. But this is so far from being the case, that every one who passes his life in tolerable ease and comfort, or rather, whose whole time is not anxiously consumed in providing the absolute necessities of existence, is conscious of wants and cravings in which the senses have no part, of a series of pains and pleasures totally distinct in kind from any which the infliction of bodily misery, or the gratification of bodily appetites, has ever afforded him; and if he has experienced these pleasures and these pains in any degree of intensity, he will readily admit them to hold a much higher rank, and to deserve much more attention, than the former class. Independent of the pleasures of fancy and imagination, and social converse, man is constituted a speculative being; he contemplates the world, and the objects around him, not with a passive indifferent gaze, as a set of phenomena in which he has no farther interest than as they affect his immediate situation, and can be rea-

dered subservient to his comfort, but as a system disposed with order and design. He approves, and feels the highest admiration for the harmony of its parts, the skill and efficiency of its contrivances. Some of these which he can best trace and understand, he attempts to imitate, and finds that, to a certain extent, though rudely and imperfectly, he can succeed; in others, that although he can comprehend the nature of the contrivance, he is totally destitute of all means of imitation; while in others, again, and those evidently the most important, though he sees the effect produced, yet the means by which it is done are alike beyond his knowledge and his control. Thus he is led to the conception of a power and an intelligence superior to his own, and adequate to the production and maintenance of all that he sees in nature; a power and intelligence to which he may well apply the term infinite, since he not only sees no actual limit to the instances in which they are manifested, but finds, on the contrary, that the farther he inquires, and the wider his sphere of observation extends, they continually open upon him in increasing abundance; and that, as the study of one prepares him to understand and appreciate another, refinement follows on refinement, wonder on wonder, till his faculties become bewildered in admiration, and his intellect falls back on itself, in utter hopelessness of arriving at an end.

When from external objects he turns his view upon himself—on his own vital and intellectual faculties, he finds that he possesses a power of examining and analysing his own nature to a certain extent, but no farther. In his corporeal frame he is sensible of a power to communicate a certain moderate amount of motion to himself and other objects; that this power depends on his will, and that its exertion can be suspended or increased at pleasure within certain limits; but how his will acts on his limbs, he has no consciousness; and whence he derives the power he thus exercises, there is nothing to assure him, however he may long to know. His senses, too, inform him of a multitude of particulars respecting the external world, and he perceives an apparatus by which impressions from without may be transmitted, as a sort of signals, to the interior of his person, and ultimately to his brain, wherein he is obscurely sensible that the thinking, feeling, reasoning being he calls *himself*, more especially resides, but by what means he becomes conscious of these impressions, and what is the nature of the immediate communication between that inward sentient being, and that machinery, his outward man, he has not the slightest conception.—HERSCHEL.—*Lardner's Cyclopaedia*.

THE PHOENIX.

Professor Rennie, in a recent lecture at the King's College, gave an elaborate account of the far-famed Phoenix, which ought to prove not a little interesting to individuals trading under the name of this bird in insurance offices, iron companies, engine factories, stage coaches, steam packets, race horses, coal wharfs, coffee houses, and innumerable other heterogeneous things—imagined, it may be supposed, to derive a mysterious influence from the name of Phoenix. The earliest account of the Phoenix is given by Herodotus, the father of history; and this has been copied with additions (a story seldom loses in its transmission), by Pliny, Tacitus, Pomponius, Mela, Horapollus, Mariana, and other writers. Among the rest, our old English writer Bartholomew Glantville, as translated by Trevisor, and printed in black letter by Wynkyn de Worde, in 1498, says, "St Ambrose, in Exameron, sayth: of the humour or ashes of fœnix ariseth a newe byrde and wexeth, and, in space of tyme, he is clothed with fethers and wyngis, and restored into the kind of a byrde, and is the most fairest byrde that is—most like to the peacock in fethers, and loveth wilderness, and gadereth his meate of cleane greenes and fruites. Alanus speketh of this byrde, and saith, that whan the highest byshop Onyas had buylded a temple in the cite of Heliopolis in Egypt, to the lykness of the temple of Jherusalem, and the fyrste daye of Easter, whaune he hadde gathered moche sweete smelling wood, and sette it on fyre uppon the altar to offer sacrifice, to all mennes syghte suche a byrde came sodaynely, and fell into the myddel of the fyre, and was brente anone to ashes in the fyre of the sacrifice; and the ashes abode there, and was besely kept and saved by the commandement of the preeste; and within three days, of these ashes was bred a lyttel worme, that took the shape of a byrde attē the laste, and flew into the wyldernes." This account, Mr Rennie remarked, "of a worm being generated out of the ashes of a sacrifice, and afterwards becoming a bird, is precisely of a piece with the methods given by Virgil and Columella for the generation of bees from dead carcases, which originated in an imperfect knowledge of the natural history of insects."

NIGHT-FALL IN ITALY.

In Mr Bell's Observations on Italy, the night-fall is thus powerfully described:—The serenity of the approach of night in these fine climates is most soothing; yet so sudden is the fall of evening, that, while we are just beginning to trace the rising stars, day is gone. But how beautiful—how grand is the contemplation of nature at this hour! how splendid the spangled sky! how soft the milky way, clearly defined in its long course, as it lies spread out in the heavens! while, perhaps, from light clouds in the distant horizon, the harmless lightning plays, as if

to mock the fire-fly, which, rising from every spot, deepened, soars and plies its busy wings, filling the air with incessant bright alternations of light and shade, and seeming to give life to the silence and stillness of the night.

PUBLIC LIBRARIES OF EUROPE.

We are enabled to state the exact number of these useful establishments, though, on a superficial enumeration, they cannot amount to fewer than between seven and eight hundred, the contents of which have been estimated by Malthus at 19,847,000 volumes. Of these contents there are preserved in

The Austrian states,	2,220,000 vols.
Prussian,	997,000
Remaining states of Germany,	3,524,500

The whole of Germany,	6,651,500
France,	6,427,000
Great Britain,	1,533,000
Russian Empire,	880,000
Italy,	2,139,000

The six most considerable, and at the same time most valuable, libraries in Europe, are the following:—

	Vols.	MSS.
Royal Library, Paris,	450,000	76,000
Bodleian, Oxford,	420,000	30,000
Royal Central, Munich,	400,000	9,000
Vatican, Rome,	100,000	40,000
University, Göttingen,	300,000	5,000
British Museum, London,	300,000	...

—*Literary Gazette*.

ODE TO POVERTY.

[The following is the production of a humble Scottish rustic, William Park, who acts as farm-servant, or "minister's man," to the Rev. Mr Brown of Eskdale-Muir. That sentiments so refined, and thoughts so profound, should reside in a peasant, whose opportunities of improving his mind are probably of the most limited nature, is in itself most wonderful, and proves, if proof were wanting, how highly the rural people of Scotland are exalted in the scale of intellect. It also proves a far more important thing—that there is no lot so mean but it may be ennobled by virtuous feeling, and the triumphs of inborn genius.]

Hail! mighty power! who o'er my lot
President unconroll'd and free;
Sole ruler of the rural cot,
I bid thee hail, dread Poverty!
Thine aid I crave to guide my strain,
Nor shall I supplicate in vain.
When on this world of woe and toil,
A helpless stranger I was cast,
Like mariner on desert isle,
The sport and victim of the blast,
Thy russet robe was o'er me flung,
And to thy cold lean hand I clung.
In youth I felt thy guardian care,
Each saving, self-denying rule,
Awful for those of fortune spare,
I learnt and practised in thy school;
And of my lengthen'd life at large,
Thou still hast taken special charge.
Much have I seen—much more I've heard,
Of chance and change in this vain world;
The low to high estate prefer'd—
From high estate the haughty hurl'd;
But chance or change ne'er pass'd o'er me—
I'm still thy subject, Poverty!
(Oh, how unwise are they who scorn
Thy homely garb and homely fare;
Who scale the tropic's burning bourne,
Ideal happiness to share!
They tread the wild, and plough the wave,
In quest of gold—but find a grave).
There are who know thee but by name,
Who spurn thy salutary laws,
And count thy badge a mark of shame,
And hold it sin to own thy cause.
Fools that they are! they never knew
Thy guiltless pride—thy spirit true.
Full oft in danger's darkest day
Thy sons have proved their country's shield,
When wealth's effeminate array
Appear'd not on the battle field:—
'Twas theirs to grasp the patriot brand,
That dropp'd from luxury's nerveless hand.
Full oft, where wealth-engender'd crime
Roll'd o'er the land its whelming tide,
Their fervent faith and hope sublime
Have stable proved, though sorely tried:
In virtue's heavenward path they trode,
When Pleasure's sons forsook their God.
And yet nor stone, nor poet's strain,
Records their honours undefil'd;
Even poetry would weave in vain
The laurel wreath for penury's child:
Should fashion sneer, or fortune frown,
'Twould wither ere the sun went down.
But greater, happier far is he,
More ample his reward of praise—
Though he should misery's kinsman be,
Though hardships cloud his early days—
Who triumphs in temptation's hour,
Than he who wins the warlike tower.
What though he may not write his name
On history's ever living page!
What though the thrilling trump of fame
Echo it not from age to age!
'Tis blazoned bright in realms on high,
Enroll'd in records of the sky.
What though the hirling bard be mute,
When humble word for notice calls,
There wants not voice of harp or lute
To hymn it high in heavenly halls:
Around the cell where virtue weeps,
His nightly watch the seraph keeps.
If peace of mind your thoughts employ,
Ye restless murmuring sons of earth!
Ah! shun the splendid haunts of joy,
Peace dwells not with unholly mirth,
But oft amidst a crowd of woes,
As in the desert blooms the rose.
Thick fly the hostile shafts of fate,
And wreck and ruin mark their course,
But the pure spirit, firm, sedate,
Nor feels their flight, nor fears its force;
So storms the ocean's surface sweep,
While calm below the waters sleep.
Oh! may eternal peace be mine,
Though outward woes urge on my war,
And Hope do thou in realms on high,
And light it with thy radiant star.
Thou, Hope! who through the shades of sorrow,
Coudest trace the dawn of joy's bright morrow.

NEW SOUTH WALES.

From an interesting parliamentary paper, it appears that the average expense of transporting a convict to New South Wales, which was in 1827, L.24, 1s. 6d., is now considerably under L.20; and that the average expense of actually maintaining and clothing a male convict there was, in 1821, L.22, 9s. 8d., but that now it does not exceed L.7, 3d. The total number of male convicts in the colony on the 1st November 1828, including those assigned to individuals, and those allowed to provide for themselves by ticket of leave, was 14,155

The total number of female convicts under the same circumstances, was 1,513

Total	15,668
The total expenditure of the government of the colony in the year 1829, is stated to be	L.306,439 8 0
Of which was contributed by the colonial revenue	99,933 15 0
Leaving to be borne by the government a total of	L.206,505 13 0

which sum, divided by the number of convicts maintained in the colony, gives L.11, 5s. 6d. as the expense of each. It should, however, be remarked, that in the expenditure for the year 1829, are included two sums of L.78,493, and L.20,000, the former for the "provisions, clothing, fuel, and the necessaries provided in the colony for the use and maintenance of the convicts;" the latter for the estimated costs of stores sent from England, and amount of expenses incurred, but not yet brought to account. The year 1829 was the last of a series of four years of drought and scarcity, and a great proportion of the wheat consumed in the colony during that year was imported from Van Dieman's Land; in consequence of this, the average price was not less than 10s. per bushel, more than double the price of 1831. The price of maize during the same year was not lower in proportion than that of wheat, and animal food was also from 50 to 75 per cent. higher than it has since become; this leaves no doubt that the maintenance of the same number of convicts, which in 1829 cost L.78,493, would not in 1831, or any future year, cost more than L.50,000. The estimate for stores, materials, &c., required from England during the present year, does not exceed L.7000; but, on the other hand, an increase may have taken place under the head of "police, jails, &c.," to the amount of probably L.5000. It will consequently follow, that supposing (as is pretty near the truth) the number of convicts maintained by the crown in ordinary service, at penal settlements, in jails, hospitals, &c., will be the same in 1831 as it was in 1829, the demands upon the English treasury will be reduced from L.206,505 to L.170,000, or L.9, 15s. for each convict. The aggregate of this estimate includes a sum of L.64,000 for the maintenance of troops in the protection of the colony, as well as in the control of the convicts, and all other charges to which the mother country is subjected on account of the colony.

According to a statement in a pamphlet published by Mr Potter Macqueen, M.P. for Bedfordshire, the average expense of a culprit in the Hulks in the years 1818-19-20-21, was L.34 0 0
Ditto at Millbank Penitentiary 56 15 0
The lowest estimate (that of Worcester Jail) in a list of 11 Penitentiaries and Jails 28 2 4
The average of the whole 11 38 7 2
The expense of sending a convict to New South Wales is, in round numbers, say 20 0 0
Annual average expense of maintenance, say 12 0 0

If, therefore, a convict is five months on his voyage, which costs L.20, and seven months in the colony at L.1 per month, there will be a saving to the nation, in the lowest estimate of Mr P. Macqueen, of L.1, 2s. 4d. for each convict in the first year of his quitting England. This clearly shows the advantages derived from transporting convicts by the mother country, where labour is so plentiful, that the punishment of the criminals interferes with the employment of the half-starved pauper.

WILLIE COSSAR PINS.

The large pins which the common people at present denominate *Willie Cossars*, were formerly called *bodle preens*, on account of their price, only four of them being given by the chapman for a halfpenny. The change of their name is said in the south country to have been occasioned by a remarkable circumstance. There was once a wandering madman, named Willie Cossar, who bore a terrible character every where for his rabid disposition. This personage one day walking along an unfrequented road, met a poor woman, who did not know his person. He asked her if she were not afraid to walk abroad by herself, considering the numerous dangers which beset solitary, and especially female travellers. She answered that she never dreaded any thing in her journeys, except the chance of encountering a wild man of the name of Willie Cossar. Willie was so enraged at this, that, out of revenge, he picked out her eyes with a large bodle pin. That species of pins thenceforward received his name. This circumstance occurred within the last seventy or eighty years.

Column for the Boys.

AGREEABLY to the plan upon which I set out, I now commence a series of amusing articles for the perusal of my juvenile readers. In the execution of this willing duty, I am wonderfully assisted by a recently published volume, entitled "THE BOYS' OWN BOOK, or a Complete Encyclopedia of all the Divisions, Athletic, Scientific, and Recreative, of Boyhood and Youth," published by Vizetelly, Brainston, and Co., Fleet Street, London, 1830. Exceedingly few of my young Scottish readers can have possibly seen this delightful production, which is written with great taste and judgment. "We heartily trust that our young readers," says the author, "will commence the perusal of our pages with pleasure equal to that which we feel in sitting down to write them, and that we shall go pleasantly together through our work. The description of these minor sports, most especially, will, we are convinced, be an agreeable pastime to us, and call up, from time to time, welcome reminiscences of those days of our boyhood when we were a hero at 'ring-taw,' and by no means a contemptible adversary even to the most accomplished youthful players at 'fives.' It will remind us of our happy holidays and favourite schoolfellows; of feats of agility performed at 'follow my leader,' and trophies borne off in triumph at 'peg in the ring;' of those merry mornings, when the first glance of the sun awakened us to snatch an additional half-hour for the play-ground, without encroaching on the allotted times for study; when, during 'winter's surly reign,' we joined the active few, who, instead of moping in greatcoats, or shivering round a fire, sallied forth into the clear, cold, invigorating air, and marking out goals and bounds in the crisp hoarfrost that mantled the ground, sought after, and found, warmth and high spirits in a game of 'prisoner's base;' or made the brows glow at lofty 'leap-frog;' or defied the frost by briskly playing the whip-top with eel-skin; and came in with glad hearts, ruddy cheeks, perfect willingness, and the best of appetites, to our morning repast, and subsequent studies. It will bring to our recollection, also, those smooth and shady spots, where, when the noontide sun was midway in the heavens, in the sultry month of August, we alternately perused pleasant and instructive books, and played with our class-mates at 'increase-pound,' or set up a pyramid of marbles for them to shoot at, or shot at one erected by one of them. It will carry us back in imagination to the hills and downs, where we flew our kites, the loftiest soarsers for miles around—of mishaps, through breaking of strings, and long races of rivalry after our falling favourites—to that cheerful parlour, in which, during the winter vacation, when mince-meat, plum-puddings, and young parties, were most abundant, on Christmas eve, or mirthful Twelfth-night, most especially—we bore a part in the exhilarating and harmless fireside sports of the season; to that dilapidated ruin—the court of that mouldering castle, with a tall and stately elm rising from one of its corners, and ivy, apparently ages old, the constant home and nesting-place of innumerable birds, which bedecked and supported the outward side of its walls—the scenes of our chief exploits at fives; to the garden walk, where our school-swing was erected between two gigantic sister pear-trees; and, in brief, to all those places where we played the games which were the delight of our holidays, when a sportive bout at 'saddle my nag' was in itself an ample recompense for the past two hours of study, employed in working an intricate question in arithmetic—composing a theme on some difficult subject—rendering a portion of the Iliad into Latin hexameters, or a passage of Pope into French prose. We conceive that we are bringing no disgrace on our boyhood, by avowing that we deeply enjoyed the sports of the play-ground. The line of a talented writer, 'A dunse at syntax, but a dab at taw,' has, by a thoughtless few, been converted into a proverb, and those who were most eminent for their activity and love of the usual amusements of youth out of school, have thus been unjustly stigmatised as inattentive students. The reverse we have generally found to be the fact, for we have often remarked, that the lads who led the sports in the play-ground stood high in their classes in the school-room. But while we recommend that the school-room should not be forgotten on the play-ground, we wish to impress on our young readers the necessity of their forgetting the play-ground in the school-room."

Passing over what are called the *Minor Sports*, which, it is presumed, are too well understood by boys to require description, I proceed to the article on *Archery*.

In this island, archery was greatly encouraged in former times, and many statutes were made for its regulation. The artillery company of London, though they have long disused the weapon, are the remains of the ancient fraternity of bowmen or archers. As to the time when shooting with the long bow first began amongst the English, there appears no certain account. Richard I. was killed by an arrow in 1199. After this time, we read nothing of archery, till that of Edward III., when an order was issued to the sheriffs of most of the English counties, to provide five hundred white bows, and five hundred bundles of arrows, for the then intended war against France. The famous battle of Cressy was fought four years afterwards, in which it is stated that we had about two thousand archers, opposed to about the same number of French.

In the fifth year of the reign of Edward IV., an act was passed, that every Englishman, and Irishman dwelling with Englishmen, should have an English bow of his own height, which is directed to be made of yew, wych, hazel, ash, or arburne, or any other reasonable tree, according to their power. The next chapter also directed that butts should be made in every township, which the inhabitants were obliged to shoot at, every feast day, under penalty of one halfpenny, when they should omit this exercise. During the reign of Henry VIII., several statutes were made for the promotion of archery. An act of Parliament, in Elizabeth's reign, regulated the price of bows. Charles I. is said to have been an archer; and in the eighth year of his reign he issued a commission to prevent the fields near London being so enclosed as "to interrupt the necessary and profitable exercise of shooting."

The Bow.—The young archer should, in the first place, select a bow that is fit and proper for his own size and strength. It is not probable that, let him be ever so skilful, he will be able to achieve such an exploit as the construction of a good bow himself; bow-making being a trade which requires many years' practice and much attention.—[Mr Muir, Archers' Hall, Edinburgh, is doubtless the most-skilful bowyer of the day.]

The back of the bow is the flat outside, and the belly the round inside part of it. The round inside part is bent inward: if the bow be pulled the reverse way, it will break: therefore, however a bow may be bent when unstrung, it is invariably to be strung with the round part inward.

Arrows.—Arrows should be delicately proportioned in length and weight to the bow for which they are intended. They are used blunt or sharp, and varying in their thickness, according to the fancy of the archer. Some are made so as to taper gradually from the feathers to the pile, and some *vice versa*; others, again, are thickest in the centre. All arrows should have their nocks or notches cased with horn, and the nocks should be of such a size as to fit the string with exactness, and be neither too tight nor too loose. Three goose or turkey feathers are affixed to arrows; one of these, denominated the cock feather, is of a different colour from the other two; and this is always to be placed uppermost.—*To be continued.*

A DERBYSHIRE TALE.

About twenty or thirty years since, a gentleman named Webster, who lived in the Woodlands, a wild uncultivated barren range of hills in Derbyshire, bordering upon the confines of Yorkshire, had occasion to go from home. The family, besides himself, consisted of the servant man, a young girl, and the housekeeper. At his departure he gave his man a strict charge to remain in the house along with the females, and not on any account to absent himself at night, until his return. This the man promised to do, and Mr Webster proceeded on his journey. At night, however, the man went out, notwithstanding all the earnest entreaties and remonstrances of the housekeeper to the contrary, and not coming in, she and the servant girl at the usual time went to bed. Some time in the night, they were awakened by a loud knocking at the door. The housekeeper got up, went down stairs, and inquired who was there, and what was their business. She was informed that a friend of Mr Webster being benighted, and the night wet and stormy, requested a night's lodging. She forthwith gave him admittance, roused up the fire, led his horse into the stable, and then returned to provide something to eat for her guest, of which he partook, and was then shown to his chamber. On returning to the kitchen, she took up his greatcoat in order to dry it, when perceiving it to be, as she thought, very heavy, curiosity prompted her to examine the pockets, in which she found a brace of loaded pistols, and their own large carving knife! Thunderstruck by this discovery, she immediately perceived what sort of a guest she had to deal with, and his intentions. However, summoning up all her courage and resolution, she proceeded softly up stairs, and, with a rope, fastened, as well as she could, the door of the room in which the villain was; then went down, and in great perturbation of mind awaited the event. Shortly after a man came to the window, and in a low, but distinct tone of voice, said, "Are you ready?" She grasped one of the pistols with a desperate resolution—presented it to his face—and fired! The report of the pistol alarmed the villain above, who attempted to get out of the room, but was stayed in his purpose by her saying, "Villain, if you open the door, you are a dead man." She then sent the servant girl for assistance, while she remained, with the other pistol in her hand, guarding the chamber door. When help arrived, the villain was taken into custody; and, on searching without, they found the servant man shot dead. Another villain who was taken shortly after, met with his deserts; and the housekeeper, who had acted with such fidelity and such unparalleled intrepidity, was soon after united to Mr Webster.

THE HUMMING BIRD.

"The humming bird (says Dampier) is a pretty little feathered creature, no bigger than a great overgrown wasp; with a black bill no bigger than a small needle, and with legs and feet in proportion to its body. This creature does not wave its wings like other birds when it flies, but keeps them in a con-

tinued quick motion, like bees or other insects; and like them makes a continued humming noise as it flies. It is very quick in motion, and haunts about flowers and fruit like a bee gathering honey; making many addresses to its delightful objects, by visiting them on all sides, and yet still keeps in motion, sometimes on one side, sometimes on the other, as often rebounding a foot or two back on a sudden, and as quickly returns again, keeping thus about one flower five or six minutes or more."

THE NATURE AND PROPERTIES OF MILK.

The chemical properties of this secretion differ somewhat in different animals. The milk of the cow has been most attentively examined, and it has the following properties:—"1, It is nearly opaque; white, or slightly yellow; of an agreeable sweetish taste, and a peculiar smell. Its specific gravity varies from 10.18 to 10.20. It boils at a temperature a little above that of water, and freezes at 32 deg. When allowed to remain a few hours at rest, a thick unctuous liquid collects upon its surface, called cream; the colour of the remaining milk becomes bluish-white, and when heated to about 100 degrees, with a little rennet, it readily separates into a coagulum, or curd, and a serum, or whey. In this way, the three principal constituents of milk are separable from each other. 2, By the process of churning, cream is separated into butter and buttermilk; the latter being the whey united to a portion of curd. Butter may be considered as an animal oil, containing a small portion of curd and whey. 3, The curd of milk has the leading properties of coagulated albumen. Curd, in combination with various proportions of butter, constitutes the varieties of cheese. That containing the largest quantity of oil becomes semi-fluid when heated; it is prone to decomposition, and a large quantity of ammonia is then formed in it; whereas bad cheese, which consists of little else than curd or albumen, shrinks and dies when heated, curling up like a piece of horn. 4, Whey is a transparent fluid, of a pale yellow colour and a sweetish flavour; by evaporation, it affords a minute quantity of saline matter, and a considerable proportion of sugar of milk."—*Library of Agricultural and Horticultural Knowledge.*

LION HUNTING.

Ten or twelve colonists, mounted and armed with their large guns, go out, and having, with the assistance of their dogs and Hottentots, ascertained where the spoiler lies, approach within a moderate distance, and then alighting, make fast the horses to each other by their bridles and halters. They then advance to within about thirty paces, backing the horses before them, knowing to within what distance, and being aware, from his aspect and motions, whether he is likely to anticipate their attack. As they advance, the lion at first surveys them calmly, and wags his tail as in a pleased or playful humour; but when they approach nearer, he begins to growl, and draws his hind parts under his breast till almost nothing of him is seen except his bushy, bristling mane, and his eyes or living fire gleaming fiercely from the midst of it. He is now fully enraged, and only measuring his distance, in act to spring upon his audacious assailants. This is the critical moment, and the signal for half the party to fire. If they are not successful in killing him at the first volley, he springs like a thunderbolt upon the horses. The rest of the party then pour in their fire upon him, which seldom fails to finish his career, though, perhaps, with the loss of one or more horses; and sometimes, though more rarely, some even of the huntsmen are destroyed in these dangerous encounters.—*Thompson's Travels in Africa.*

NEGRO DOCTOR.

Of the thirteen months which Dampier spent in Virginia, he has left no record; but from another portion of his memoirs, it may be gathered that he suffered from sickness during most of the time. His disease was not more singular than was the mode of cure practised by a negro Esculapius, whose appropriate fee was a white cock. The disease is what is called the *Guinea-worm*. "These worms," says our navigator, "are no bigger than a large brown thread, but (as I have heard) five or six yards long; and if it break in drawing out, that part which remains in the flesh will putrify, and endanger the patient's life, and be very painful. I was in great torment before it came out. My leg and ankle swelled, and looked very red and angry, and I kept a plaster to it to bring it to a head. Drawing off my plaster, out came about three inches of the worm, and my pain abated presently. Till then I was ignorant of my malady, and the gentleman at whose house I lodged took it (the worm) for a nerve; but I knew well enough what it was, and presently rolled it upon a small stick. After that I opened it every morning and evening, and strained it out gently, about two inches at a time, not without pain. The negro doctor first stroked the place affected, then applied some rough powder to it, like tobacco leaves crumbled, next muttered a spell, blew upon the part three times, waved his hands as often, and said that in three days it would be well. It proved so, and the stipulated fee of the white cock was gladly paid."—*Edinburgh Cabinet Library.*

PRICE THREE HALFPENCE.

FALLACIES OF THE YOUNG.

"FATHERS HAVE FLINTY HEARTS."

I ONLY quote this popular expression from a very popular play, in order to warn my juvenile friends against being too much impressed by it. It is a fatal error running through nearly the whole mass of our fictitious literature, that parents are represented as invariably adverse, through their own cruel and selfish views, to the inclinations of their children: either the glowing ambition and high spirit of the boy is repressed by the cold calculations of his father, who wishes him to become a mere creature of the counting-room and shop like himself; or the romantic attachment of the girl to some elegant Orlando, procures her a confinement to her chamber, with no other alternative than that of marrying a detestable suitor, whom her father prefers to all others on account of his wealth. Then, the boy always runs away from his father's house, and, by following his own inclinations, acquires fortune and fame, while the girl as invariably leaps a three-pair-of-stairs window, and is happy for life with the man of her choice. The same dangerous system pervades the stage, where, I am sorry to remark, every vicious habit of society, and every impropriety in manners and speech, is always sure to be latest abandoned.

I warn my juvenile readers most emphatically against the fallacy and delusion which prevails upon this subject. Fathers, as a class, have not flinty hearts, nor is it their wish or interest, in general, to impose a cruel restraint upon their children. Young people would do well to examine the circumstances in which they stand in regard to their parents and guardians, before believing in the reality of that schism which popular literature would represent as invariably existing between their own class and that of their natural protectors. The greater part, I am sure, of my young friends must have observed that, so long as they can remember, they have been indebted for every comfort, and for a thousand acts of kindness and marks of affection, to those endeared beings—their father and mother. The very dawning light of existence must have found them in the enjoyment of many blessings, procured to them solely by those two individuals. From them must have been derived the food they ate, the bed they lay on, the learning at school which enabled their minds to appreciate all the transactions and all the wisdom of past times, and, greatest blessing of all, the habits of devotional exercise which admitted them to commune with their Almighty Creator. Surely it is not to be supposed that, at a certain time, the kindness and friendship of these two amiable persons is all at once converted into a malignant contrariety to the interests of their children. Is it not far more likely, my dear young friends, that they continue, as ever, to be your wellwishers and benefactors; and that the opposition which they seem to set up so ungraciously against your inclinations, is only caused by their sense of the dangers which threaten you in the event of your being indulged? It may appear to you that no such danger exists; that your parents are actuated by narrower and meaner views than your own, or that they do not allow for the feelings of youth. But they are in reality deeply concerned for the difference of your feelings from theirs; they sympathise with them in secret, from a recollection of what were their own at your period of life; but know, from that very experience of your feelings, and of their result, that it is not good for you that they should be indulged. You are, then, called upon—and I do so now in the name of your best feelings, and as you would wish for present or future happiness—to trust in the reality of that parental tenderness which has never, heretofore, known interruption, and in the superiority of that

wisdom with which years and acquaintance with the world have invested your parents.

Perhaps, my young friends, you may have perceived, even in the midst of your childish frolics and careless happiness, that your parents were obliged to deny themselves many indulgences, and toil hard in their respective duties, in order to obtain for you the comforts which you enjoy. You may have perceived that your father, after he had returned home from his daily employment, could hardly be prevailed upon to enter, as you wished, into your sports, or to assist you with your lessons, but would sit, in silent and abstracted reflection, with a deep shade of care upon his brow. On these occasions, perhaps, your amiable and kind protector is considering how difficult it is, even with all his industry, and all his denial of indulgences to himself, to procure for you an exemption from that wretchedness in which you see thousands of other children every day involved. But though many are the cares which your parents experience in the duty of rearing you to manhood, there is none so severe or so acute as that which comes upon them at the period of your entering into life. Heretofore, you were simple little children, with hardly a thought beyond the family scene in which you have enjoyed so many comforts. Heretofore, with the exception of occasional rebukes from your parents, and trifling quarrels with your brothers and sisters, you have all been one family of love, eating at the same board, kneeling in one common prayer, loving one another, as the dearest of all friends. But now the scene becomes very different. You begin to feel, within yourselves, separate interests, and each thinks himself best qualified to judge for himself. At that moment, my young friends, the anxiety of your parents is a thousand times greater than it ever was before. Your father, probably, is a man of formed habits and character; he occupies a certain respectable station in the world; he has all his life been governed by certain principles, which he found to be conducive to his comfort and dignity. But though he has been able to conduct himself through the world in this satisfactory manner, he is sensible, from the various, and perhaps altogether opposite characters which nature has implanted in you, that you may go far wide of what have been his favourite objects, and perhaps be the means of impairing that respectability which he, as a single individual, has hitherto maintained. It is often observed in life, that children who have been reared by poor but virtuous parents, as if their minds had received in youth a horror for every attribute of poverty, exert themselves with such vigorous and consistent fortitude, as to end with fortune and dignity; while the children, perhaps, of these individuals, being brought up without the same acquaintance with want and hardship, are slothful through life, and soon bring back the family to its original condition. If you then have been reared in easy circumstances, you may believe what I now tell you, that your approach to manhood or womanhood will produce a degree of anxiety in the breasts of your parents, such as would, if you knew it, make your very hearts bleed for their distress, and cause you to appear as monsters to yourselves if you were to act in any great degree differently from what they wished.

How much, then, is it your duty, my young friends, to treat the advices and wishes of your parents, at this period of life, with respect, knowing, as you do, that the future happiness of those dear and kind beings depends almost solely upon your conducting yourselves properly in your first steps into life. Should you be so unfortunate as to be beguiled into bad company, or to contract a disposition to indulgences which are the very bane of existence, and the ruin of reputation,

what must be the agony of those individuals who have hitherto loved and cherished you, and indulged, perhaps, in very different anticipations! On the contrary, should you yield respect, as far as it is in your nature, to the maxims which your father has endeavoured to impress, with what delight does he look forward to your future success—with what happy confidence does he rely upon your virtuous principles! And may there be no happiness to you, in contemplating the happiness which you have given to him? Yes, much, I am sure, and of a purer kind than almost any which earthly things can confer upon you here below.

I have one word to add, and it is addressed to the female part of my juvenile readers. Exactly as parents feel a concern for the first appearance of their sons in the business of life, so do they experience many anxious and fearful thoughts respecting the disposal of their daughters in matrimony. Wedded life, I may inform them, is not the simple matter which it appears prospectively in early and single life. As it involves many serious duties and responsibilities, it must be entered upon with a due regard to the means—above all things, the pecuniary means—of discharging these in a style of respectability, such as may be sufficient to support the dignity of the various connections of the parties. It is, therefore, necessary that no person of tender years (this is most frequently the lot of the female) should contract the obligations of matrimony, without, if possible, the entire sanction of parents or other protectors. The people of this country happen to entertain, upon this subject, notions of not so strict a kind as are prevalent in most other nations. In almost all continental and all eastern countries, the female is reared by her friends as the destined bride of a particular individual; and till her marriage, she is allowed no opportunity of bestowing her affections upon any other. The custom is so ancient and so invariable, that it is submitted to without any feeling of hardship; and as prudence is the governing principle of the relations, the matches are generally as happy as if they were more free. Perhaps such a custom is inapplicable to this country, on account of our different system of domestic life; but I may instance it, to prove to my fair young readers, that the control of parents over their choice of a husband ought to be looked upon as a more tolerable and advantageous thing than their inclinations might be disposed to allow, or our popular literature represents it to be.

FORMATION OF SCOTTISH SOCIETY.

Continued.

THE Somervilles are amongst the most ancient families of note in Scotland. The first of the name in Britain was Gualter de Somerville, who accompanied William the Conqueror to England, and obtained from him estates in Staffordshire and Gloucestershire. He left several sons, and died at the commencement of the twelfth century. One of these sons, named Gualter, inherited his estates in England, and the second attached himself to Earl David, when he came to Scotland. On arriving in this country, David conferred on him the manor of Carnwath, in Clydesdale, in reward for his attachment, and there have been Somervilles in this part of Scotland ever since.—There was at one time a family of the name of Umphraville, of considerable note, in this country; the first of whom attached himself to Earl David. The family enjoyed various lands in Stirlingshire; but, after a residence in the country for about half a century, merged for lack of heirs. There are, in all probability, not many persons in Scotland who are aware of the origin of the name Maxwell. The first of this family, in this country, was also a follower of David, from whom he re-

ceived a grant of land on the Tweed. The name of this person was *Maccus*, and his place of residence requiring the appropriate name of *Maccus-ville*, such a term was, in the course of time, shortened, and corrupted into *Maxwell*.—But of all those Anglo-Saxons who settled in Scotland, scarcely any that we hear of arrived at such eminence as that of *Sules*, or *Souls*. The first of this line was Ranulph de Sules, who followed David from Northamptonshire into Scotland. The attachment of Ranulph was amply rewarded by a grant from him of Liddesdale, the manor of Nisbet, in Teviotdale, with some other lands, both in this district and in Lothian. In Liddesdale, where he thus settled before the middle of the twelfth century, he built a fortalice, called *Hermitage Castle*, which gave rise to the village of Castletown, and has been the subject of numberless popular traditions, some of which I shall perhaps, at an after period, detail. In 1271, William de Soules was knighted at Haddington by Alexander III., and under the same monarch he became justiciary of Lothian. He was one of the *Magnates Scotiae*, or principal men of the kingdom, who engaged in 1284 to support the succession of the Princess Margaret to her grandfather, Alexander III. In 1290, he was present with Sir John Soules in the celebrated parliament of Birgham—now a poor hamlet on the Tweed, below Kelso—for betrothing the heiress of Scotland to the prince of England. This Sir John de Soules was one of the ambassadors to France, for marrying Joletta, the daughter of the Count de Dreux, to Alexander III. In 1294, he again went to France—this will partly show to the Scotch of the present day, the species of intercourse that took place in former times betwixt the Scottish and French nations—to negotiate the marriage of Edward Baliol with a daughter of Charles, the French king's brother. In 1299, he was made *Custos Regni Scotiae*—Keeper of the Scottish Kingdom—by John Baliol. In 1300, the same Sir John Soules commanded at the siege of Stirling Castle, which was surrendered to him by the English. In 1303, he was one of the Scottish commissioners at Paris. At the capitulation of Strathurd, on the 9th of February 1304, he was excepted by Edward I. from the ignominious conditions imposed on the vanquished, and it was provided that he should remain in exile for two years. When Robert Bruce entered on his active career, he was joined by Sir John Soules, and for his services was rewarded with a grant of the baronies of Kirkcaldrews and Thorowald, and the lands of Bretallach, in Dumfriesshire. Some years afterwards, he closed his gallant career as a soldier of Scotland. Following Edward Bruce to Ireland, he was slain with him in battle near Dundalk, on the 5th of October 1318. These de Souleses had other two brothers; one named Sir Thomas de Soules, of the county of Roxburgh, who swore fealty to Edward I. in 1296, and Sir Nicholas de Soules. In 1300, Thomas was taken prisoner by the English in Gallo-way; and Edward I. ordered *fourpence a-day* to be paid as his allowance. This curious particular is learned from the Wardrobe accounts. It appears that in 1306, Alicia, the widow of Thomas de Soules, did homage to Edward I. for lands in Scotland. It is a remarkable circumstance in the family history of the Souleses, that, among others, one of them laid claim to the crown of Scotland—an event which overwhelmed and ruined the family altogether. The claimant was Nicholas de Soules (supposed by some to have been the above Nicholas); and the historian Prynne thus deduces the claim:—"Alexander II. left a bastard daughter, Margery, who married Allan Doorward, an active, ambitious baron, who died in 1275, leaving three daughters; one of these daughters, Ermingard—this beautiful female name was once common among the higher classes in Scotland—married a Soules; and of this Soules was Nicholas the competitor." The seal of this ambitious man has been engraved by Astle, among the Scottish seals; but his armorial bearings are quite different from the arms of the Liddesdale family of Soules, as set forth by Nisbet; from which circumstance there is reason to infer that there was some difference in the lineage. I leave better antiquaries and genealogists than myself, however, to clear up the obscurity. The next family I have to mention is that of *Avenel*; but here I stop for the present.

SKRYME.

Though popular narrative, when general and unvarying, is an authority by no means despicable; and though proverbial wisdom affirms that what all men say must be true, it cannot be denied that there are some common and general observations which bear all the marks of absurdity, and which to support, would argue utter credulity, or what is worse, superstition. Most of my readers are acquainted with Skryme, the apothecary, who deals out doses of alarm for the mind, and confusion for the body, to the inhabitants of Little Britain, in the *Sketch Book*. This venerable gentleman has in Scotland many disciples and apostles, male and female, who entertain all sorts of strange and dark beliefs, and, in fact, form a part of the public entirely beyond the reach of the intelligence which is perpetually emanating in one shape or other from the press. Skryme's apostles assert, for instance, in defiance of all experience, that if a culprit about to be hanged can get the appointed hour past, he may laugh at executioners, bailies, and all, and walk away a free man; also, that if the rope breaks, he cannot be hung

up again.* They believe, too, that Friday makes a point of being always the best or the worst day of the week; that men have one rib less than women, on Adam's account; and that the dove has no gall, in consequence of its sacred emblematical character, and its services at the flood. They are dead-certain that the half of the people that die come alive again in the grave, and turn themselves round in their coffins. They believe that horses, on account of the convexity of their eyes, think men larger than themselves, and otherwise would not submit to human government. They tell children, by way of encouraging an industrious disposition, that every member of the royal family is taught some trade, that he may be able to support himself by his hands, should the craft of kingship fail him. George III., according to the Skrymists, was bred a shoemaker. They believe that cats see best in the dark; that bats have wings made of leather; that to take much salt, tends to make one dark-complexioned; that the man in the moon is a real man, who was put up there for gathering sticks on the Sabbath day; and they are convinced that beasts have a language among themselves.

Among the natural objects which the disciples of Skryme have invested with supernatural attributes, rats are not the least distinguished. Rats, it is true, are a peculiar people; while the ignorance which generally prevails regarding them, gives a good deal of scope for the imagination. Rats, say the Skrymists, sometimes remove in whole nations. The old aboriginal rat of this country is now totally extirpated, or removed, and the present race is of German extraction, who came in soon after the accession of the house of Brunswick. They also remove in whole cities, occasionally in whole streets, or still more frequently in housefuls. It has been known in Edinburgh that a whole street has all at once been evacuated, and a neighbouring one at the same instant taken possession of. One particular street in the New Town was last year announced to be completely hollowed out below, like a honeycomb, by rats, in consequence of which, the proprietors can tell that the houses have all been, this year, by a sort of poetical justice, very much under-rated in the way of rent. Rats are a sort of fair-weather friends in their way, always departing from a house when misfortune is about to befall it, and from a ship before the last fatal voyage.

It is very remarkable that almost every town in Scotland has a street called the Rotten-Row: and still more so, that with all the Rotten-Rows is associated some Skrymism upon the subject of these mysterious animals. There is a Rotten-Row at Dunfermline, and I shall relate the Skrymism connected with it:—On the day before the great fire in Dunfermline, in 1622, when almost every house was destroyed, the whole of the rats of the town gathered themselves together, and were observed to go out to the country in a leisurely and orderly manner by this narrow lane; the blind, according to the established custom of rats, being led by their companions with straws in their mouths! Whatever credit may be given to it, the fact is attempted to be established by another equally incredible, but which several living witnesses remain to attest. On the day before a great inundation of the Dean Burn, which runs through Dunfermline, many rats were observed to leave their place of abode, near the banks of that stream, and climb, with their young, up a tall tree. By this means they escaped the deluge that would otherwise have drowned them in their dens, and were enabled to look down with an air of cool contempt upon the two-footed people below, who, for want of the same providence, were exposed with their property to the raging fury of the flood.

THE RUSSIAN COURT.

At ten I called, in a coach-and-four, upon Needham, to take him to the court, at the Annishoff palace. The court is like all other courts. Here we remained with chamberlains, masters of ceremonies, grand chamberlains, generals, colonels, captains, &c., until about eleven, when we were presented in a circle to the emperor. His imperial majesty is a remarkably fine-looking man, of upwards of six feet in height. His countenance is open and ingenuous, his manner frank, but a little inclining to brusque. If I were to see such a man in a crowd, I should say "that man is born to be an emperor." He is thirty-six years of age, and is represented by all those who have access to his person, and who are well acquainted with his character, to be the model of a prince and of a man. His fine physiognomy is expressive of benignity, magnanimity, and intelligence. He received us in private audience; and as we stood in a sort of semicircle, he went round and addressed something kind and pertinent to our professions and nation to each of us. He asked me if I had ever seen in India any thing of the cholera; to which I replied, that I had never served in India, but that I had had the complaint commonly called the cholera morbus, twice in my life—once at Buenos Ayres, in South America, and once at Constantinople. His majesty seemed surprised, and asked me how I was treated for it; to which I replied, the first time simply with barley-water made very sweet, and the second time with syrup of orjeat and water. I remarked, likewise, that the Arabs, who were well acquainted with the cholera, treated it with rice-water

* P.S. I have since observed, in the ancient code of laws, known by the name of the *Regiam Majestatem*, that such was once the fact.

and sugar. "Ah!" said his imperial majesty, "you have not had the oriental cholera, but its first cousin; but," said he, "your remedy is deserving of notice." He observed, that he trusted that the measures he had caused to be taken, of quarantine and *cordon sanitaire*, would check the progress of the disorder; but, he added, it is very difficult in Russia to make the people pay obedience to sanitary regulations. "You, in England," said he, "respect and obey the law, and enforce the quarantine rigorously." I replied, that I hoped the excellent example set by himself, in performing fourteen days of quarantine, on his return from Moscow, would be productive of good effects.—*Frankland's Russia.*

MAJOR WEIR.

THE following account of this notorious sorcerer is from Fraser's *Divine Providences*, MS. Advocates' Library. It is the most minute and curious which the editor of the Journal has ever met with, and possesses additional value, as the narrative of a contemporary. Fraser was a minister of the reign of Charles II.

"One Thomas Weir, whom I saw at Edinburgh, anno 1660, commonly called Captain Weir, was born in Clydesdale, near to Lanark, anno 1607, the son of one John Weir, first a peugh-maker, and afterwards a farmer. About the year 1639, he took on with a Captain Young for Ireland, where, about the year of the massacre of that kingdom, he was made serjeant, and about the 45 (1645), turned lieutenant. In the 48, he came to Scotland; and Edinburgh being the metropolitan and centre of the kingdom, Thomas Weir made acquaintance with many, and not the worst, personating a deal of gravity and mystification, and frequenting sermons frequently, till, in the end, he went under the notice and got the repute of a singular professor. At length, he got a charge over the waiters at the ports of the city, being a check to them. About 1650, he got the place of major in the town guard, and so was ever after called Major Weir. His garb was still a cloak, and somewhat dark, and he never went without his staff. He was a tall black man, and ordinarily looked down to the ground—a grim countenance and a big nose. At length he became so notoriously regarded among the Presbyterian strict sect, that, if four met together, be sure Major Weir was one. At private meetings, he prayed to admiration, which made many of that stamp court his converse. He never married, but lived in a private lodging with his sister, Grizel Weir. Many resorted to his house to hear him pray, and join with him; but it was observed that he could not officiate in any holy duty without the black staff or rod in his hand, and leaning upon it, which made those who heard him pray admire his flood in prayer, his ready extemporary expression, his heavenly gesture; so that he was thought more angel than man, and was termed by some of the holy sisters ordinarily *Angelical Thomas*. And yet, how wonderful it is, this vile counterfeit was a devil and a varlet, and was in compact with the devil, upwards of fifty years in his service, from whom he got the gift of utterance and this enchanted staff, for by it he was enabled to pray and to commit sins not fit to be named.

By the use of this staff he was enabled to conciliate the favour of many, to reconcile neighbours, even husband and wife when at variance, which purchased him veneration with all, and brought him vast gain and profit. In short, this villain lived all his time in horrid wickedness, especially the years that he abode at Edinburgh. At length, like the wild ass, [he] was found in his mouth. Coming one day, as his custom was, to view the waiters, he found them drinking and neglecting their charge. After a gentle reproach, one of them replied, that some of their number being upon duty, the rest had retired to drink with their old friend and acquaintance Mr Burn; at which word Major Weir started back, and, casting an eye upon him, repeated the word *burn* four or five times, and, going home, came not abroad again for a long time after. It was observed by some, that going to Libberton sometimes, he shunned to step over that brook ordinarily called Libberton Burn, but went about to shun it. By this men have conjectured, and not amiss, that he had been advised to beware of a burn, or some other thing which this equivocal word might signify, as *burn in a fire*. If so, he hath foreseen his day approached nigh. A year before he discovered his imposture, he took a sore sickness, during which time he spake to all that visited him like an angel, and he came frequently abroad again. A while after this, he took some dreadful tortures of conscience, and, the terrors of the Almighty being upon his spirit, he called in several neighbours to his house, to whom he confessed, and that most willingly, the particular sins he was guilty of; with sad aggravations, which bred amazement to all persons, coming from a man of such repute of religion and piety. He ended with this remarkable expression, 'Before God,' says he, 'I have not told the hundredth part of that I could tell, and am guilty of.' These same very abominations he confessed before the judges likewise; but after this he would never, to his dying hour, confess any more which might have been to the glorifying of God and edification of others, but remained stupid and heavy, having no confidence to look any man in the face, or to open his eyes. When two of the magistrates of Edinburgh came to his house in the night-time, to

carry him to prison, they asked if he had any money to secure. He said none. His sister said there was. Whereupon, there was found in parcels here and there to the value of five dollars, which they took up. His sister advised the magistrates to secure his staff especially, which they did. Thereafter, he and his sister were both carried away and secured in the Tolbooth. The bailies returning home, went into a tavern in the West Bow, near to Weir's house; the money was put into a bag, and the clouts thrown into the fire, which, after an unusual manner, made a circling and dancing in the fire. There was another clout found with some hard thing in it, which also they threw into the fire. It looked like a root, which curled and sparkled like gunpowder, and, passing up the funnel of the chimney, it gave a crack like a little cannon, to the amazement of all who were present. The foresaid money was taken by one of the bailies to his own house, and laid by in his closet. After family worship, he retired to the said closet, during which time his wife and the rest of the family were affrighted with a terrible noise within the study, like the falling of a house, three times successively. His wife, knocking, gave a fearful cry, saying, 'My dear, are you alive?' The bailie came out unafraid, and said he heard nothing. Whether he concealed this upon the account that his wife was with child, or otherwise, is uncertain.

During the time of his imprisonment, he was never willing to be spoken to; and when the ministers of the city offered to pray for him, he would cry out in fury, 'Torment me no more, for I am tormented already.' One minister asking if he would pray for him, he answered, 'Not at all!' The man, in a zealous anger, said, 'I will pray for you in spite of your teeth, and the devil your master, too.' So he prayed in his hearing, and the witnesses observed that Weir stared wildly, and was senseless as a brute all the while. Another asked him if he thought there was a God; he said, 'I know not.' The other replied, 'O man! the argument that moves me to think there is a God, is thyself, for what else moveth thee to inform the world of thy wicked life.' But Weir answered, 'Let me alone.' When he peremptorily forbade one of his parish ministers to pray, one demanded if he would have one of the Presbyterian persuasion to pray. He answered, 'Sir, you are now all alike to me.' Then, said the minister to him, 'I will pray with you.' 'Do it not,' said he, 'upon your peril,' looking up to the beams of the house. But prayer was made so much the more heartily, because the company present expected some vision. It is observable, that in things common he was pertinent enough; but when any thing about Almighty God, and his soul's condition, came about, he would scraugh, and strike his breast, crying, 'Torment me not before the time!'

At length he was sentenced to be burnt; and when the account of this was given him, he stood mute and stupid. When he was at the stake to be burnt, the city ministers called to a cunning man there looking on, a Presbyterian (of which persuasion Weir was formerly deemed to be), to speak to him; but no sooner had he opened his mouth than the vile wretch made a sign with his hand and his head to be silent. When the rope was about his neck, to prepare him for the fire, he was bid say, 'Lord be merciful to me!' but he answered, 'Let me alone. I will not. I have lived as a beast, and I must die as a beast.' The fire being kindled, he dropped a little after into the flames—a sad spectacle to behold; and, shortly after, his black spectre was cast into the fire with him. Whatever incantation was in it, the persons present aver that it gave rare turnings, and was long a-burning, as also himself.

Major Weir was brought to his dreadful, desperate, and yet deserved death, April 14, 1670, at the Galloway Lee, between Leith and Edinburgh."

SKETCHES IN TOPOGRAPHY.

EDINBURGHSIRE.

It is ascertained that, before the close of the eleventh century, agriculture had made some progress in the district of Mid-Lothian, though at that period, and an epoch much later, the greater part of the shire continued to be covered by the aboriginal forests of the country. The district contiguous to the fortress of Edinburgh, now disposed in fertile lawns, was then covered by primeval forests of oaks, within whose boundaries royalty enjoyed the diversions of hunting; and if we may credit the legend, it was in the wood of Drumshugh that David I. encountered the stag, under such miraculous circumstances as led to the erection of the religious house of Holyrood. The grants to different monasteries show that woods and shrubberies must have prevailed to a great extent, and been serviceable not only for fuel, but for yielding shelter, pasturage, and food, for numerous brood-mares, cattle, sheep, and swine. Edward III. did much to diminish the extent of the forests; but although, in his time and subsequently, the woods of Mid-Lothian suffered a sensible diminution, it is found that, as late as 1513, the Boroughmoor, whereon James IV. mustered the army of the kingdom, before setting out for Flodden, was, according to Hawthorn-den, "a field spacious and delightful, by the shade of many stately and aged oaks." In the history of Edinburgh it is recorded that these "aged oaks" were

rooted out as a public nuisance—all citizens who chose to cut wood being permitted, as a premium for their industry, to use it in extending their houses seven feet into the street. We may here notice, as indicating the aptness of the soil for this species of production, that the grounds still bear some of the largest trees in the country. During the last and the present century, much has been done in Mid-Lothian in the way of rearing plantations. At Dalkeith, Newbottle (now and improperly called *Newbattle*; the term signifying "the new residence," from *bottl*, a Saxon word), Arncliffe, New Hailes, and Pinkie, there is some remarkably fine hard wood of a large size. At Newbottle, the trees, which are chiefly beech, are unrivalled in their exuberance and magnitude, seeming from their gnarled branches, as aged as the days of the Abbot Radulphus, in the thirteenth century. Around every gentleman's seat in the country there are modern plantations, sometimes to a very large extent, which add beauty to the district, and give shelter to the fields. In the upland tract of country, stretching towards Peeblesshire, between the Pentland and Moorfoot Hills, a vast extent of territory has of late years been very judiciously planted by the family of Clerk of Pennycook. Rabbit-warrens seem to have been common in Mid-Lothian in the days of the monks, but they are now entirely gone.

In old times, there were extensive pasturages for sheep on Gala Water, a district still principally devoted to such purposes; and, in old writings, often called *Wae-dale*, from the doleful events which had taken place in it: this term is most probably the original of the surname *Weddel*. The other parts of the country were farmed by the three great classes, the king, the abbots, and the barons, each of whom had extensive commons free to the flocks of their immediate vassals or neighbours. From such a primitive process of management, a system gradually arose in the county, of landlords giving their vassals leases of farms with stock, which was rented as well as the land, and which the tenant was obliged to restore when he delivered up the farm to its owner. Practices of this nature were copied from the example of the freeholders of England, and obtained, by the law of Scotland, the name of letting lands by *steel-bow*. In examining the early agricultural condition of Mid-Lothian, it is found that this part of Scotland, as well as Haddingtonshire, at one time abounded in the three good characteristics of a country—mills, kilns, and breweries; and from the increase of these establishments, is inferred the progress of agriculture. Mid and East Lothian were likewise noted, during the Saxon period, for their superior horticulture. The monks of Newbottle and Holyrood, like their brethren every where else in Scotland, not only employed much of their leisure time in the delightful amusement of gardening, but, by their example, fostered the arts of cultivating flowers and rearing fruit-trees. Near Edinburgh, there thus originated some pleasant gardens. It appears that David I. had a garden under the castle, now entirely gone; but the garden of Holyrood still remains, and attests, by its appearance, the culture it must have received from its religious attendants upwards of six hundred years since. During the reign of James III. even the poorest tenants in Mid-Lothian had their gardens, which supplied them with *kail*; and before the accession of James VI., gardens were universal in the district.

Scotland owes the introduction of the use of coal to the monks of Newbottle, who had the merit of discovering this valuable substance. Till about the end of the twelfth century, the common fuel of the inhabitants was either wood or peat. Grants of *peataries* for fuel were exceedingly common at this and a later period. In their parish of Preston, in Haddingtonshire, the monks of Newbottle discovered and wrought coal, before the accession of Alexander II., or the year 1214. The practice of digging for coal spread from thence into Edinburghshire; and I find that, at the accession of James I., there were collieries at Dud-dington, Gilmerton, Newbottle, and other places. The discovery of coal, nevertheless, did not by any means abolish the use of the ancient and more easily acquired fuel, as I find that in Edinburgh, in 1584, the ordinary fuel was wood, heath, whins, broom, &c. Great stalks of these were piled up in the different lanes, for the use of the inhabitants, in the same manner as peat-stacks may still be seen in villages remote from coal. It happened that one of these piles was set on fire in the night, either intentionally or casually, which so much alarmed the inhabitants, that the town-council immediately issued an order for removing the stacks to the side of the North Loch, and other waste ground around the city. The making of salt from the water of the Frith of Forth seems to have been known in the country at least a hundred years before the introduction of coal as fuel; indeed, the invention of manufacturing sea-salt in this way is so ancient, that it cannot be dated. [The small coal used in this manufacture is still, oddly enough, called *wood*.] Grants of salt-pans to abbays were numerous in the thirteenth century. David I. granted a salt-pans to the monks of Holyrood in 1128; and I learn, from the chartularies of Newbottle, that that establishment had salt-pans on the Forth in the twelfth and thirteenth centuries. The mode of manufacturing this article was, however, very rude; but the French retinue of Queen Mary comprised some ingenious persons, who amended the process; and, in the ninth parliament of that princess, they obtained an act, con-

ferring upon them the exclusive privilege of manufacturing this article. By an act of parliament in the reign of Charles II., these and all other salt-works were declared to be free, and deemed public manufactures.

The roads of the country remained long in a bad condition, though in this they were not in any respect singular. The chief roads, anciently, were only those betwixt the different monasteries, and from thence to the metropolis. Under the reign of Alexander III., the term *regia via* is found applied, and hence the phrase, in our times, *king's highway*. There was a *regia via* betwixt Newbottle and Edinburgh. The first statutes with regard to highways are said to have been made under David II., but it was not till so late as 1714, that any turnpike act was applied to the country. For many years even after that period, the necessity of good roads was neither understood nor acted upon; and it may be said that here, as well as elsewhere, a perfect convenience of this kind was unknown till the age immediately past. The roads in the county of Edinburgh are now the best in Scotland, though sustained at a most enormous expense—(I believe £50,000 a-year). They possess the advantage—now by no means uncommon in Scotland—of having footpaths by the edge of the highway. It is mentioned as a remarkable fact, in Robertson's Survey, that wheel-carriages were not used for purposes of husbandry in Mid-Lothian till the accession of George I., and this may give an idea of the general condition of Scotland at that recent period. Yet it is a fact no less true, that wheeled carts and waggons, or wains, were used by the monks in husbandry five centuries and a half before the reign of the first George. To reconcile these conflicting statements, it may be presumed that, for a very long period, there was an age of misery in Scotland, during which the troubles occasioned, in the first place by English ambition, and, in the second, by religious contests and other difficulties, prevented the spirit of the nation from cultivating the arts which lead to increased comfort and extended means of supporting a population.—*Chambers's Gazetteer of Scotland*.

THE RUNAWAY.

AN ENGLISH TALE, BY MISS MITTFORD.

ONE of the most retired-looking spots in our thickly-peopled neighbourhood, is the pretty little nook called Sandleford Green; a small, very small patch of green sward formed by a casual receding of the fields at a place where two narrow shady lanes cross each other, leaving just room enough, in one angle, for a clear mirror-like pond, with glorious old thorns dipping into it from the surrounding hedges; whilst a village pond, enclosing a noble oak, occupies another corner; and a third is completely overshadowed by two large horse-chestnut trees, standing like sentinels on either side of a gate, which leads through a short deep lane to the only dwelling within sight or hearing. No spot is, apparently, so entirely out of the way and out of the world as Sandleford Green! And yet the well-beaten footpaths, two or three of which, striking in different directions across the fields, met in this spot as a common centre, intimated that the little Green was a place of some resort—as indeed it actually was—not so much as a thoroughfare, but from its own independent attraction; the one solitary and unostentatious tenement of which it boasted, being famous all through the country for its home-brewed ale: the fine Sandleford beer, most emphatically called strong, holding so high a rank amongst the consumers of that formidable beverage, that people sent for it far and near; and the liveried grooms of two or three neighbouring equires might often be seen galloping on their thoroughbred hunters to seek this only liquor worthy to wash down their master's Siltion, at the same moment that poor Dame Wheeler's little girl was crossing the stile for her sick grandmother's daily half-pint; and half the rustics in the parish pouring in to enjoy, in Joseph Dobson's own taproom, or beneath his honeysucked porch, their own less moderate potations. "First come first served," was Joseph's motto; and although, on the whole, a man of impartiality, it is doubtful whether he had not some pleasure in keeping the lacqueys in attendance, and the grandees whom they served in expectation, whilst he administered to the wants of his humbler and more sociable customers. A chuckling, bustling, merry knave was our landlord, and a freespoken; had a vote for the county, which he regularly bestowed on the opposition candidate, be the ministers whom they might. Joseph thought no honest man could ever vote for the ministry—that was his creed: owed no one a shilling, and was too confident in the power of his ale to have any dread of the magistrates and the licence act:—"Old Sir Thomas can't finish his dinner without a glass of my beer," thought Joseph; "and I may be as saucy and independent as I please."

Whatever might be the merits of the Sandleford ale, there could be no question as to the beauty and picturesqueness of Joseph's habitation. It was a high, narrow, tower-like house, with chimnies like turrets, and every sort of gable-end and inequality of which a building is capable, harmonised and enriched by an old vine, which, after creeping up one side of the house, nearly covered the roof, garlanding the very chimnies, and wreathing its luxuriant abundance of leaf, and fruit, and tendrils, wherever a shoot could find place, until it fairly hung over on the other side—until its

rich festoons nearly met the branchy honeysuckle, (Milton's "twisted eglantine"), which, climbing up, shaded a rude but fanciful and airy porch, such as is often seen in Wouverman's pictures, adding grace and lightness even to them. Nor was the garden, which reached, on one side, to a small meandering brook, the large garden, full of beds of vegetables and berry bushes, almost hidden by wide flower-borders, very nicely kept; or the long strip of beautiful green sward, the meadow, orchard, or pleasure-ground (for it might pass for either of these), with its fine grove of old fruit-trees—pear, plum, cherry, and apple—terminated by its smooth bowling-green and goodly arbour, at all unworthy of the picturesque dwelling to which they were appended. The territory behind, a miniature farm-yard, with stabling for two, cart-room for one, a commodious cow-shed, and pigsties, goose-houses, and hen-houses, out of number, its populous duck-pond, and its abundance of noises—horses neighing, cows lowing, calves bleating, pigs grunting, geese gabbling, ducks quacking, cocks crowing, hens cackling, and doves cooing—was also a lively stirring scene, especially when animated by the presence of mine host, portly, sturdy, and comely, an excellent representative of his own brown stout, with twenty pigeons fluttering about him (for Joseph, amongst other fancies, was a great pigeon-fancier), and two or three pet tumblers or fan-tails perched on his shoulder. In short, every thing about the place, from the two rosy smiling lassies, his daughters, down to the fat yard-dog and sleek tabby cat, seemed emblems of rural plenty and English independence; meet appendages to the sign of the Foaming Tankard, which swung in creaking magnificence from a post in front of the dwelling.

By far the most interesting inmate of this small village hostelry, was one, whose whole appearance formed the strongest possible contrast to the rest of that flourishing establishment. Mary Walker, the only child of the good landlord's only sister, was a tall thin young woman, with a pale, mild, serious countenance, great simplicity of dress and manner, and a general delicacy both of look and demeanour, belonging partly, perhaps, to ill health, but so much connected with a natural elegance of mind, that it hushed even her boisterous uncle and his boisterous customers into something like gentleness; just as the presence of a born gentlewoman might have done, if it were possible to fancy a born gentlewoman seated in the taproom of the Foaming Tankard.

To say truth, the taproom was a place that Mary seldom visited. The noise, the talking, the singing, the smell of tobacco, or even the odour of the famous Sandleford beer, would have kept her from that well-frequented resort of the thirsty souls of the village, even if the dread of encountering some of her many lovers had not been sufficient to hinder her from putting her foot across the threshold.

The cause of Mary Walker's many conquests might be found, perhaps (at least *she* certainly thought so), in the circumstance of her being a rustic heiress, having just so many hundreds of pounds as made her a great match in her own degree; the cause of her being, at two-and-twenty, unwedded, and unlikely to wed, will take rather more telling, although the story be short enough, and common enough too.

Joseph Dobson had had a son, called William, as unlike his father as possible; a gay, lively, mercurial spirit, too quick, or, as his poor mother used to say, too clever to learn—too ready at many trades to stick steadily to one; and so full of varying schemes and changeable resources, that every body, except that doating mother, felt convinced, that, in spite of William's acknowledged talent, his destiny would prove unpropitious.

The only chance for its being otherwise, lay in his strong affection for his fair cousin, Mary Walker. Her influence over him, especially after the death of his fond but misjudging mother, who had fostered his wild and expensive habits by supplying him with money for their indulgence, formed the only counteraction to his natural and acquired unsteadiness of character. Even his father, although knowing him best and fearing him most, looked forward, with some degree of hope, to the period when he should be quietly married to Mary; and she herself—(how strange it is, that the mildest and most reflective woman should be so often carried off her feet by the giddiest wild-goose of a man!)—she herself idolised him; overturned all the disinterested objections of her uncle and guardian, to risking her money and her happiness with so flighty a swain; and even laid aside much of her own timidity, to hasten, as far as her natural modesty would permit, the proposed union.

On the very evening before the intended marriage, William, who, amongst his other caprices, was frequently subject to the fury of jealousy, was seized with a violent fit of that amiable passion, the object being no other than George Bailey, my lord's game-keeper, as good-natured a fellow as ever lived, and a constant visitor at the sign of the Foaming Tankard. He had brought two tame pheasants, a cock and a hen, as a present to Mary, who was known to be fond of pet poultry; "a wedding present," as he had whispered at parting, and Mary, unluckily, had admired the beauty of the birds.

"You like the birds for the sake of the giver, Mary," said William, chafed at the warmth with which George had shaken hands with her in the moment of departure, and the mingled blush and smile with which she had received his whispered farewell;

"you are thinking of the master's good looks, of his gay plumage, and not of the birds."

"The master thinks little of me, or I of him. You are quite mistaken as to both of us," replied Mary.

"You admire the beauty of the donor," pursued William, pertinaciously; "you talk of the pheasants, but you are thinking of him."

"Not I indeed!" exclaimed Mary.

"But you are, I say, madam," resumed William, with increasing violence. "George Bailey is the beau of the parish, as you are the belle. We all know that; and for my poor part, I think it a great pity that you should be separated."

"If you think so, William," said poor Mary, and then, unable to finish the sentence, burst into tears.

"Well, madam, if I think so!"

"Then—oh William! William! how cruel this is, when you know that I love you, and nobody but you, in this wide world."

"If I think so, madam, then—pray finish what you were going to say. There is nothing I hate so much as these sort of scenes."

"Then," said Mary, resuming her firmness, "we had better part."

"Certainly, madam, we had better part; I agree with you perfectly," said the intended bridegroom, walking out of the house, without listening to the threats of his father, the remonstrances of his sisters, or even the gentle assurances of Mary herself, that neither George Bailey nor she had ever thought of each other.

Joseph Dobson stormed, his little daughters fretted and wondered, and poor Mary cried; but all fully expected that that night at supper-time, or, at latest, by peep of dawn, William would re-appear, repent, and be forgiven; for a temper "which carried anger as the flint doth fire," had the redeeming grace of being eminently sweet and sunshiny, especially after one of these sudden storms; so that Mary, after feeling the exceeding delight of reconciliation, used sometimes to wonder whether she should like William as well, if he were always quiet and civil like other people. Mary cried, expecting to be comforted; but the comforter whom she expected did not arrive. The evening passed away—the night—the next morning, that which would have been the bridal morning!—the day—the intended wedding day!—and still no tidings of William. His father traced him to London; and then came a report that he was gone on board ship—he had had such a fancy in his boyhood, engendered by reading Robinson Crusoe; and then came rumours of shipwreck, at first doubtfully listened to, but gradually believed, as month after month, and year after year, glided by, without any tidings arriving of the unhappy fugitive. Surely if he had been alive, he would have written, was the secret thought and feeling of all.

In his own home, long absence had produced its usual effect, and things had returned to their ordinary course, with little reference to the life or death of the young man. His father, first immoderately angry, then intemperately grieved, had resumed his former jovial temper and bustling habits; his light-hearted sisters had ceased to hope, or fear, or lament; and his old companions had well nigh forgotten that he had ever existed. Forgotten, indeed, he was by every body except poor Mary, who cherished his memory with the gentle sadness of a young widow, and turned from love and lovers with the fond fidelity of a turtle dove that has lost its mate. Never was heart more devoted and true; as Ben Brown, the fat exciseman, and Aaron Keep, the lean shoemaker, and tall Jem Ward, the blacksmith, and little Bob Wheatley, the carpenter, besides at least a score more of rejected suitors, could testify—George Bailey being nearly the only young man in the parish who had never made Mary Walker an offer, having, within three months of the present present, brought home a very sufficient reason for not doing so, in the shape of an exceeding pretty black-eyed wife. Poor Mary! she would have done wisely in following the example of the rest of the world, and forgetting William Dobson; but, as she used to say, when urged on the subject, she could not.

Meanwhile, time rolled on, and it was now some years since any thing had been heard of him. Mary was drawing towards its close—that loveliest month, which joins the spring flowers with the summer leaves. The country was in its prime of beauty; and Sandleford Green, with its pearly bunches of hawthorn overhanging and reflected in the clear bright pond, the horse-chestnuts covered with their pyramidal flowers, the golden broom skirting round the meadows where the young lambs were at play, the orchard one glow of blossom, the lilacs and laburnums scenting the air, and the honeysuckle perfuming the porch. Sandleford was the sweetest and prettiest of all country places; and Mary was standing under the honeysuckle, looking at the blue sky, and the green grass, and the flowery fruit-trees so gay in the sunshine, and thinking how wrong it was in her not to be happy, when all on a sudden the good landlord advanced from the farm-yard with a troubled countenance, calling for Mary, and Bessy, and Kate, a mess of milk, a jug of ale, and a bottle of brandy. "There's a man lying dead or dying in the cart-house," added he; "make haste, lasses! make haste!"

Mary, catching at the hope of life, hurried into the house to dispatch some messenger for medical assistance; his daughters flew to his assistance, and half the customers in the taproom followed with instinctive curiosity to the cart-house.

The man was not dead; and mine host and little Kate were administering, or rather offering (for he seemed incapable either of speaking or swallowing), their various remedies.

"Who can he be, father?" said Kate; "what can have brought him here?"

"How should I know, child?" replied the man of the Tankard; "'tis a poor ragged famished wretch, as you see, who, I suppose, could crawl no farther. But I think he'll live! He's looking about him, and he seems likely to come to. Get your cousin's smelling-bottle, Bessy; and don't crowd round him so, good folks! Why, even Neptune has crept up to him, and is half smothering the poor wretch. That looks as if it was somebody the dog knew."

And the poor creature, the sick, famished, ragged creature, writhed on his straw, and groaned, and gasped as if for speech.

"Where are Mary's salts, girls! See how Neptune's licking the poor wretch's hands? Where is Mary?"

And at that instant Mary entered; the sick man half rose up, and she knew him! "William! gracious God! 'tis William!" And instantly she was kneeling at his side, and supporting him in her arms, aided, as it happened, by our old friend the keeper, who had been taking his morning draught in the tap. Poor William looked from one to the other—

"Are ye married?" said he, with a strong effort.

"Yes," said George; "no," said Mary; both in a breath.

"To think of my not knowing my own son!" exclaimed the father, bending over him, the tears running over his rough cheeks. "But his very mother could not have known him, so fond of him as she used to be! Nobody would, but Mary. Welcome home, my boy! We'll soon set thee up again. Welcome, my own dear boy!"

"Welcome home, dear William!" echoed the sobbing sisters.

But William listened to none of them. "Are you married?" was again his question.

"Yes!" said George smiling.

"But not to me, William!—not to me, dear William!" said Mary; and the poor runaway grasped her hand between his trembling ones (Neptune fondling them all the time), and life, and health, and love, were in the pressure; and the toils, the wanderings, the miseries of his four years' absence, were all forgotten in that moment of bliss!—*Literary Souvenir*, 1832.

EMIGRATION.

THE editor has been favoured with the perusal of a letter, written by a young Edinburgh lawyer, from the United States of America, whither he had gone to prosecute his professional pursuits. The following extract will, doubtless, be esteemed of value by many readers of the Journal:—

"Rochester, Monroe County, N. Y.

"Before I proceed with my promised observations, I must give you some information about my own proceedings since I came to Rochester. Since I came hither I have been in three different offices, and have now as good prospects as any young man of my profession in the place. You are, perhaps, aware that seven years is the period of clerkship necessary to be gone through before being admitted to the bar of the Supreme Court of this state, but that four years' classical studies are received in lieu of legal education. The term of clerkship is fixed by one of the judges of the Supreme Court. I had to produce all the certificates from the different professors, and the length of the terms of the universities of Scotland. The Chief Justice before whom my case came, at the term of the court of Albany in July last, stated that he could allow nothing whatever for the period of my clerkship or legal studies in Scotland, and that even an admission in the Supreme Court there, or any other foreign court, would avail me nothing. He stretched the rule of court, however, as far as possible, and fixed my period of probation, or clerkship, at three years, after which, on examination, I can be admitted to practise as attorney and counsellor in any Court of Common Pleas in any county in this state, and as attorney in the Supreme Court. The Courts of Common Pleas are, in themselves, as important as the Supreme Court, only their jurisdiction is confined to a particular county, and an appeal lies from their decision to the Supreme Court. I am quite satisfied with the period of clerkship assigned to me by the court; for, during my probation, I am, of course, strengthening my interest here, and preparing myself for the great arena of legal disputation on which I shall ultimately appear, and where I shall have to cope with very different men from the county writers of Scotland. I have, besides, much to study; for really my legal education in Scotland will be of exceedingly little value here. You will understand that the English common law is in full force in this and most other states in the Union, unless where altered by special statute; and the courts of judicature in this state, although greatly improved in comparison with the English, are still essentially English in their operation. Now, there is scarcely a single step of the legal proceedings here that bears the least degree of similarity to the Scotch practice; every step, even to the backing of a paper, is entirely different. It has, accordingly, cost me, since I came to this place, some pretty hard study to

comprehend the practice of the courts. I am now, however, fast acquiring such a knowledge, and I expect that, in a short time, I shall be as good a practitioner as my brethren. Perseverance will surmount all difficulties. What a noble field English jurisprudence opens to the mind! I feel every day more attached to the study. We read in it, not a collection of dry maxims and wise sayings, but a great system, every part of which is linked inseparably together, and the whole founded and interwoven with the great principles of civil liberty. Well may Britons claim it as their birthright, and well has Lord Coke described it as the perfection of human reason.

This place is well adapted for making good lawyers. The justices' courts here form an excellent preparatory school for young men. The justices are elected by the people for four years, and have jurisdiction in personal property to the extent of 50 dollars (nearly £2 sterling). Young law students are almost always employed by the litigants. The proceedings are conducted on the same model as the other courts, and with nearly the same solemnity. A jury is empanelled, if either party desires it; the case is opened by the counsel of the plaintiff; witnesses are then examined on each side; the counsel on each side address the jury, or the justice, after the case is closed, with all the eloquence and force of argument they are master of. The judge charges the jury; the jury retire, deliberate, and return their verdict; in short, the proceedings are exactly the same in these inferior tribunals as you see in the Jury Court in Edinburgh, and that although the sum in dispute be comparatively small. I have already been engaged in several of these suits, and have had the honour of addressing an American jury in a speech of half an hour's length in a justice court: I have also been complimented on my success. The fees which the young lawyers get for conducting a case of this kind, are about 10s. or 15s. sterling if in town, and about £1 if in the country. My remuneration at present, from my employer, goes to pay all my expenses. In a future letter I shall tell you something about the courts in this state, and the character and talent of our lawyers here; at present I may only say, that I have a high opinion of them generally."

IRON BRIDGES.

THE credit of having first suggested the practicability of constructing bridges of iron, has been claimed for Thomas Paine, who is said to have conceived the idea from contemplating the fabrication of a spider's web in America. Whatever may be thought of this assertion, it is certain that, in 1787, Paine presented to the Academy of Sciences at Paris the model of a bridge which he had invented; and it is equally a fact, that during the greater part of the year following, he resided at Rotherham in Yorkshire, where a bridge, chiefly of wrought iron, was constructed under his direction by the Messrs Walker. Whatever may have been the precise principle of this pattern bridge, it was taken to London, exhibited there for a time, returned again to Rotherham, and there broken up. Pieces of this fabric were not long since to be seen on the premises of Messrs Walker; some of which pieces were occasionally carried away as curiosities, by persons preferring a fragment of the handiwork to a relic of the osseous system of the famous author of the "Rights of Man!" It appears, however, from designs now or lately in the possession of Mr White of Devonshire Place, that Mr Pritchard, an architect, of Eytton Turret, Shropshire, so early as the year 1773, suggested the practicability of constructing wide iron arches, capable of admitting the passage of the water of such a river as the Severn; and, in fact, the first practical exhibition of the plan, on a large scale, was the construction of the bridge at Colebrook Dale, chiefly in accordance with Mr Pritchard's plans.

In 1790, Rowland Burdon conceived the idea of throwing an arch of cast iron over the river Wear, at Sunderland: for which, two years afterwards, and after surmounting some opposition, he obtained an act of Parliament. The use of iron had previously been introduced in the construction of the arch at Colebrook Dale, and in the bridges built by Paine. Mr Burdon's plan consisted in retaining, together with the metallic material, the usual form and principles of the stone arch, by the subdivision of the iron into blocks, answering to the key-stones of a common arch. These blocks were of cast iron, five feet in depth and four in thickness, connected together by bars and cottars of wrought iron. The entire structure consists of six ribs, each containing 105 of these blocks, abutting on each other, like the voussoirs of a stone arch. The ribs are six feet distance from each other, braced together by hollow tubes and bridles of cast iron. The whole weight of the iron is 260 tons; 46 malleable, and 214 cast. The arch is the segment of a large circle, of which the chord or span is 236 feet. This magnificent structure, which was executed at the foundry of the Messrs Walker of Rotherham, was completed within three years; Mr Thomas Wilson, of Bishop Wearmouth, being the architect. This bridge was, at the time of its erection, considered to be the largest arch in the world; and being placed, too, at a considerable elevation above the river, it forms a remarkably picturesque object. The whole expense of the undertaking was £26,000, of which sum £22,000 was subscribed by Mr Burdon, the original projector. This famous bridge was, in October 1816, disposed of by lottery, consisting of 6000

tickets, and 150 prizes, of the value of from £100 to £500, to the total amount of £30,000.

In 1827, Mr Deebie, a metropolitan engineer, obtained a patent for an ingenious method of casting metal blocks for the purpose of forming caissons, jetties, piers, quays, embankments, lighthouses, foundations, walls, or other such erections. These blocks, which are hollow cases, so cast as to fit into each other by grooves and dovetails, and other contrivances, would form masses of exceeding strength in combination. There is, however, one fatal objection to their adoption in situations where they might be most useful: the sea water, by some unexplained process, so alters the nature of cast iron, that its cohesion appears to be quite destroyed. Cannon which have been fished up after lying long in the sea, have been found converted through their substance into something resembling plumbago, and admitting of being cut with a knife.—*Lardner's Cyclopædia.*

BIOGRAPHIC SKETCHES.

DR ALEXANDER MURRAY.

THIS was the son of a poor Galloway shepherd, who finally died professor of Oriental Languages in the College of Edinburgh, and author of various works in the science of language, which the world has declared to be more profoundly learned than almost any other that exist. The narrative which follows was written by himself, to satisfy the curiosity of a friend; and as an account of the triumph of genius over difficulties, I can only compare it to that of Ferguson the astronomer.

"I was born on Sunday, the 22d of October 1775, and baptised a fortnight after, on Tuesday, 7th November—stated in the register of baptisms to be the 27th, but the old style is understood (in the register). The place where my father then lived is called Duncitterick, or commonly Kitterick; in Earse, Duncatharaich—the *know* of the cattle. It is on the burn of Palneur, on the south side about a quarter of a mile from the burn, and on a rivulet that flows from the high hills above on the south. The hills of Craignelder, Milfore, and others, quite overshadow the spot, and hide it from the sun for three of the winter and spring months. The cottage has been in ruins for more than twenty years, as the farm is herded from the house of Tenotrie, the tenant of which holds both Tenotrie and Kitterick. This place, now laid open by a road, was, when my father lived there, in a completely wild glen, which was traversed by no strangers but smugglers. Patrick Heron's family, in Craigdews, were our next neighbours; and the black rocks of Craigdews were constantly in our sight. My father, Robert Murray, had been a shepherd all his days. He was born in autumn 1706, and remembered the time of the battle of Sheriffmuir. Our clan were, as he said, originally from the Highlands. My great grandfather, Alexander Murray, had been a tenant, I believe, of Barnkiln, near the present site of Newton Stewart, but he had retired into Minigaff village before his death. He had several sons. John, my grandfather, was all his life a shepherd. He married, when he was young, a woman named Helen McCaa. His children were—Patrick, father of old John Murray in Blackcraig, my father (Robert, born in Garlag), William, John, and Grisel. My grandfather herded almost all his married lifetime the farm of Craigenallie, rented by old Patrick Heron, Esq., of Heron. My father married, about 1730, a woman of the name of Margaret McDowal, and had by her many children—Agnes, John, William, Robert, James, some of these are still alive—very old people. All the boys became shepherds. My father lived chiefly in a place called Garrarie, on the river Dee, opposite to Craigenallie, and in the parish of Kells. His wife died, I think, about 1770. In December 1774, or rather in January 1775, he married my mother, whose name is Mary Cochrane. She was the daughter of a shepherd also, who came originally from the parish of Balmaghie, and whose forefathers had been small tenants on the estate of Woodhall. She was born August 13, 1739, and was more than thirty-five years old at the time of her marriage. My father was then in his sixty-ninth year, which he had completed before I was born. When I became of age to know him, except his very grey, or rather white, hair, I remember no symptoms of the influence of time about his person or in his appearance. He enjoyed *hale* good health till about a year before his death, which took place at Torwood, or Derwood, in the parish of Kells, in August 1797.

He had been taught to read English in a good style for his time; he wrote not badly, but exactly like the old men of the seventeenth century. He had a considerable share of acuteness or natural sagacity, a quality possessed by most of his clan. His temper was rather irritable, but not passionate. His moral character was habitually good; and I know, from his way of talking in private about the thefts and rogueries of other persons, that he actually detested these vices. He was very religious in private; but in company he was merry, fond of old stories, and of singing. Patrick Heron, your elder, if alive, will give you a better account of him than I can. He was no fanatic in religious matters, and always respected the established clergy, whose servants he never, like many other people, criticised, at least in my hearing. My brother James, his youngest son by the first marriage, died of a fever in 1781 or 1782. His death, which hap-

pened at some distance from home, was reported to my father early on a Sunday morning, and I, then a child, could not conceive why my father wept and prayed all that day.

Some time in autumn 1781, he bought a catechism for me, and began to teach me the alphabet. As it was too good a book for me to handle at all times, it was generally locked up, and he throughout the winter drew the figures of the letters to me in his *written* hand, on the board of an old *wool-card*, with the black end of an extinguished heather stem or root snatched from the fire. I soon learned all the alphabet in this form, and became *writer* as well as *reader*. I wrote with the *board* and *brand* continually. Then the catechism was presented, and in a month or two I could read the easier parts of it. I daily amused myself with copying, as above, the *printed* letters. In May 1782, he gave me a small psalm-book, for which I totally abandoned the catechism, which I did not like, and which I tore into two pieces, and concealed in a hole of a dike. I soon got many psalms by memory, and longed for a new book. Here difficulties arose. The Bible, *used every night* in the family, I was not permitted to open or touch. The rest of the books were put up in chests. I at length got a New Testament, and read the historical parts with great curiosity and ardour. But I longed to read the Bible, which seemed to me a much more pleasant book, and I actually went to where I knew an old loose-leaved Bible lay, and carried it away in piecemeal. I perfectly remember the strange pleasure I felt in reading the history of Abraham and of David. I liked mournful narratives, and greatly admired Jeremiah, Ezekiel, and the Lamentations. I pored on these pieces of the Bible in secret for many months, for I durst not show them openly; and as I read constantly, and remembered well, I soon astonished all our honest neighbours with the large passages of Scripture I repeated before them. I have *forgot* too much of my biblical *knowledge*; but I can still rehearse all the names of the patriarchs from Adam to Christ, and various other narratives seldom committed to memory.

My father's whole property was only two or three scores of sheep, and four mairland cows, his reward for herding the farm of Kitterick for Mr Alexander Laidlaw in Clatteranshaws, on the other side of the Dee. He had no debts, and *no money*. We lived in a wild glen, five or six miles from Minigaff, and more from New Galloway. All his sons had been bred shepherds; he meant to employ me in that line; and he often blamed me for laziness and uselessness, because I was a bad and negligent *herd-boy*. The fact was, I was always a weakly child, not unhealthy, but not stout. I was short-sighted, a defect he did not know, and which was often the occasion of blunders when I was sent to look for cattle. I was sedentary, indolent, and given to books, and writing on boards with coals. In 1783, my fame for wondrous reading, and a *great memory*, was the discourse of the whole glen. But my father could not pay the expenses of lodging and wages for me at any school. In harvest 1783, William Cochrane, a brother of my mother, returned from England, where he had made a few hundred pounds as a travelling merchant. He came to visit our family, and being informed of my *genius*, as they called it, undertook to place me next spring at New Galloway school, and to lodge me in the house of Alexander Cochrane, my grandfather, then alive, and dwelling about a mile from New Galloway. This simple expedient might have occurred to my parents, but I never heard them propose it; the idea of school wages frightened them from employing it. I was brought to New Galloway about the 26th of May 1784, and for a month made a very awkward figure in the school, then taught by Mr William Gordon: he read English well, and had many scholars. Mr Gillespie, who is almost my equal in years, being born in 1775 or 1776, was then reading the rudiments of Latin. My pronunciation of words was laughed at, and my whole speech was a subject of fun. But I soon gained impudence; and before the vacation in August, I often stood *dux* of the Bible class. I was in the meantime taught to write copies, and use paper and ink. But I both wrote and printed, that is, imitated printed letters when out of school. My morals did not equally improve. My grandfather was an old man, and could not superintend my proceedings. I learned, therefore, to swear, lie, and to do bad tricks, all which practices I have ever since detested. I was fourteen days, or thereby, at this school after the vacation had terminated. But in the beginning of November 1784, I was seized with a bad eruption on the skin, and an illness, which obliged me to leave school, which I saw no more for four years.

In spring 1785, my health grew a little better. I was put to assist as a shepherd boy the rest of the family. I was still attached to reading, printing of words, and getting by heart ballads, of which I procured several. I had seen the ballad of Chevy Chase at New Galloway, and was quite enraptured with it. About this time, and for years after, I spent every sixpence that friends or strangers gave me on ballads and penny histories. I carried bundles of these in my pockets, and read them when sent to look for cattle on the banks of Loch Greanoch, and on the wild hills in its neighbourhood. Those ballads that I liked most were Chevy Chase, Sir James the Rose (by Michael Bruce), Jamie and Nancy, and all heroic and sorrowful ditties. This course of life continued through 1785, 1786, and 1787. In that time I had read, or rather

studied daily, Sir David Lindsay, Sir William Wallace, the Cloud of Witnesses, the Hind let Loose, and all the books of piety in the place. My fame for reading, and a memory, was loud, and several said I was 'a living miracle.' I puzzled the honest elders of the church with recitals of Scripture, and discourses about Jerusalem, &c. &c. In 1787 and 1788, I borrowed from John Kellie, then in Tenotrie, and still residing, I believe, in Minigaff, Salmon's Geographical Grammar, and L'Estrange's version of Josephus. I got immense benefit from Salmon's book. It gave me an idea of geography and universal history, and I actually recollect at this day almost every thing it contains. I learned to copy its maps, but I did not understand the scale. In 1788, or early in 1789, Basil, Lord Daer, came to attend a committee of the gentlemen on the line of road between New Galloway and Newton-Stewart. He had made a map of the whole valley of Palneur from Dee to Cree, which map he lost on the moors near Kitterick. It was found and given to me, and I practised drawing plans of the glen of Palneur, correcting and printing the names of places, according to my own fancy.

As I could read and write, I was engaged by the head of two families in Kirkowen parish to teach their children. The name of the one was Robert Milligan, and the other was Alexander Milroy, laird of Morfad, an old and singular man, who had young grandchildren. I taught these pupils during the winter of 1787-8, but got acquainted with few books. I received copies of the numeration and multiplication tables from one M^r William, a boy of my own age, and a brother teacher. I returned home in March 1788. My fees were fifteen or sixteen shillings. Part of this I laid out on books, one of which was the History of the Twelve Cæsars, translated from Suetonius; another, Cocker's Arithmetic, the plainest of all books, from which in two or three months I learned the four principal rules of arithmetic, and even advanced to the rule of three, with no additional assistance, except the use of an old copy-book of examples, made by some boy at school, and a few verbal directions from my brother Robert, the only one of all my father's sons, by his first marriage, that remained with us. He was then a cattle-dealer on a small scale. In June 1788, I made a visit to Minigaff, and got from old John Simpson, a cartwright, and a great reader, the loan of several volumes of Ruddiman's Weekly or Monthly Magazine during 1773, 1774, and 1775, and an old, ill-written, and superstitious history of the Four Monarchies, of the Popes, the Kings of England, &c. My memory now contained a very large mass of historical facts and ballad poetry, which I repeated with pleasure to myself, and the astonished approbation of the peasants around me. On the 26th of May 1789, my father and his family left Kitterick, and came to herd in a place called Drigmorn, on Pal-kill Burn, four miles from Minigaff. He was engaged by Mr Ebenezer Wilson, now residing in Barneuchla. A prospect now opened of my attending Minigaff school. I set out by myself, and arrived in Minigaff village, where my friend, John Simpson, lived, and where Mr Cramond, schoolmaster of Minigaff, dwelt. I think he lodged in Simpson's house. Mr Cramond received me, and I travelled every day from Drigmorn to Minigaff. I read some English, but applied chiefly to writing and arithmetic. In the course of the summer I ran over Dilworth's Arithmetic. But I was not in stout health; and the distance from school was great, and I generally attended only three days in the week. My teacher allowed this. I made the most of these days; I came about an hour before the school met; I pored on my arithmetic, in which I am still a proficient; and I regularly opened and read all the English books, such as the Spectator, World, &c., brought by the children to school. I seldom joined in any play at the usual hour, but read constantly. It occurred to me that I might get qualified for a merchant's clerk. I, therefore, cast a sharp look towards the method of book-keeping, and got some idea of its forms by reading Hutton in the school, and by glancing at the books of other scholars. When the vacation came on, I was obliged to quit school. At Martinmas 1789, I was engaged by three families in the moors of Kells and Minigaff to teach their children. I bought Mair's Book-keeping, having sent to Edinburgh for it by a man who rode as post between Wigton and Edinburgh. The families, one of which belonged to my eldest brother, resided at great distances one from another. My brother lived in the Backhill of Garrarie; another family lived in Buchan, on Loch Trool; a third on the Dee, near Garrarie. I migrated about, remaining six weeks in each family. Among these mountains I found several books—Walker's Arithmetic; a History of England; a volume of Langhorne's Plutarch, having the Lives of Eumenes, Pompey, Scipio, &c.—and Burns's Poems, all which I read with perpetual and close attention. I was fond of verse of all kinds. In 1787, before leaving Kitterick, I made a *soffing ballad* on a neighbour shepherd and girl of my acquaintance. This was my original sin as to verse. In 1789, the whole moorlands of Ayrshire and Galloway were engaged in discussing the doctrines of a book written by Dr Macgill, one of the ministers of Ayr. I entered with much zeal and little knowledge into the feelings of the people, and declaimed against Socinianism and various religious opinions, which I certainly was not of an age to understand.

A little before Whitsunday 1790, I returned home

to Drigmorn. My father had been engaged to herd in Barneuchla, a farm within two miles of Minigaff village, to which farm we removed on the 26th May 1790. I had now easy access to school, and went regularly. As I now understood writing and accounts, in imitation of other lads in the country, I wished to add to these a little French. These were the sum total of qualifications deemed necessary for a clerk intending to go to the West Indies or America.

I had, in 1787 and 1788, often admired and mused on the specimens of the Lord's Prayer in every language found in Salmon's Grammar. I had read in the magazines and Spectator, that Homer, Virgil, Milton, Shakspeare, and Newton, were the greatest of mankind. I had been early informed that Hebrew was the first language, by some elders and good religious people. In 1789, at Drigmorn, an old woman, who lived near, showed me her psalm-book, which was printed with a large type, had notes on each page, and likewise what I discovered to be the Hebrew alphabet, marked letter after letter in the 119th psalm. I took a copy of these letters, by printing them off in my old way, and kept them.

I borrowed from one Jack M^r Bride, at Bridgend of Cree, Chambaud's Rudiments of French Grammar. About the 30th of May 1790, I set to work on it. My indulgent master gave me whole pages of lessons, and in less than a fortnight I began to read lessons in the second volume of the Diable Boiteux, a book which he gave me. Robert Kerr, a son of William Kerr in Risque, was my friend and companion. He, in preparation for Grenada, whither he soon went, had for some time read French. His grammar was Boyer's, and the book which he read in, an old French New Testament. There was another grammar in the school, read by Robert Cooper, son of Mr Cooper, late tenant in Clarie. In the middle of the days I sat in the school and compared the nouns, verbs, &c. in all these books; and as I knew much of the New Testament by memory, I was able to explain whole pages of the French to Kerr, who was not diligent in study. About the 15th of June, Kerr told me that he had once learned Latin for a fortnight, but had not liked it, and still had the 'Rudiments' beside him. I said, 'Dolend me them; I wish to see what the nouns and verbs are like, and whether they resemble our French.' He gave me the book; I examined it for four or five days, and found that the nouns had changes on the last syllable, and looked very singular. I used to repeat a lesson from the French Rudiments every forenoon in school. On the morning of the midsummer fair of Newton-Stewart, I set out for school, and accidentally put into my pocket the Latin Grammar instead of the thin French Rudiments. On an ordinary day, Mr Cramond would have chid me for this, but on that festive morning he was *mellow*, and in excellent spirits—a state not good for a teacher, but always desired in him by me, for he was then very communicative. With great glee he replied, when I told him my mistake, and showed the rudiments, 'Gad, Sandy, I shall try thee with Latin,' and accordingly read over to me no less than two of the declensions. It was his custom with me to permit me to get as long lessons as I pleased, and never to fetter me by joining me to a class. There was at that time in the school a class of four boys advanced as far as the precursus in Latin grammar. They ridiculed my separated condition. But before the vacation in August, I had reached the end of the rudiments, knew a good deal more than they, by reading at home the notes on the foot of each page, and was so greatly improved in French that I could read almost any French book, at opening of it. I compared French and Latin, and riveted the words of both in my memory by this practice. When proceeding with the Latin verbs, I often sat in the school all mid-day, and pored on the first pages of Robert Cooper's Greek Grammar, the only one I had ever seen. He was then reading Livy, and learning Greek. By help of his book I mastered the letters, but I saw the sense of the Latin rules in a very indistinct manner. Some boy lent me an old Corderius, and a friend made me a present of Eutropius. I got a common vocabulary from my companion Kerr. I read to my teacher a number of colloquies, and before the end of July was permitted to take lessons in Eutropius. There was a copy of Eutropius in the school that had a literal translation. I studied this last with great attention, and compared the English and Latin. When my lesson was prepared, I always made an excursion into the rest of every book, and my books were not like those of other schoolboys, opened only in one place, and where the lesson lay. The school was dissolved in the harvest. After the vacation, I returned to it a week or two to read Eutropius. A few days before the vacation, I purchased from an old man, named William Shaw, a very bulky and aged edition of Ainsworth's Dictionary. This was an invaluable acquisition to me. It had all the Latin words and the corresponding Greek and Hebrew, likewise a plan of ancient Rome, and a dictionary of proper names. I had it for eighteen-pence, a very low price. With these books I went off, about Martinmas, to teach the children of Robert Kerr, tenant in Garlarg, English reading, writing, arithmetic, and Latin. In his house I found several more books—Ruddiman's Grammar, the most obscure of all works that ever were offered to children for their instruction, a book on which I laboured much to no great purpose—Cæsar and Ovid. I employed every moment in pondering over these books. I literally read the dictionary throughout. My method was to revolve the leaves

of the letter A, to notice all the principal words, and their Greek synonyms, not omitting a glance at the Hebrew; to do the same by B, and so on through the book. I then returned from X and Z to A, and in these winter months I amassed a large stock of Latin and Greek vocabularies. From this exercise I took to Eutropius, Ovid, and Cæsar, or at times to Ruddiman's Grammar. The inverted order often perplexed me, and I frequently mistook, but also frequently discerned, the sense. The wild fictions of Ovid have had charms for me ever since. I was not a judge of simple and elegant composition; but when any passage contained wild, sublime, pathetic, or singular expressions, I both felt and tenaciously remembered them. Here I got another book, which from that time has influenced and inflamed my imagination. This was 'Paradise Lost,' of which I had heard, and which I was eager to see. It was lent me by Jean Macmillan, at present residing in Minigaff village, then house-keeper in Garlarg, and afterwards married to Robert Murray, my brother's son. I cannot describe to you the ardour or various feelings with which I read, studied, and admired this *first-rate* work. I found it as difficult to understand as Latin, and soon saw that it required to be *parsed* like that language. I had the use of this copy for a year, and replaced it with one of my own. I account my first acquaintance with Paradise Lost an era in my reading. —Murray's Literary History of Galloway. Second Edition.

(To be continued.)

WOURALI POISON.

Waterton, an intrepid traveller in South America, gives the following interesting account of the method pursued by the Indians in making wourali poison, a species of matter of the most powerful action on animal life, but which destroys life so gently, that the victim appears to be in no pain whatever; and probably, says he, were the truth known, he feels none, saving the momentary smart at the time the arrow enters. A day or two before the Macoushi Indian prepares his poison, he goes into the forest in quest of the ingredients. A vine grows in these wilds which is called wourali, and it is from this that the poison takes its name, and it is the principal ingredient. When he has procured enough of this, he digs up a root of a very bitter taste, ties them together, and then looks about for two kinds of bulbous plants, which contain a green and glutinous juice. He fills a little vessel, which he carries on his back, with the stalks of these, and lastly, ranges up and down till he finds two species of ants: one of them is very large and black, and so venomous that its sting produces a fever. It is most commonly to be met with on the ground. The other is a little red ant, which stings like a nettle, and generally has its nest under the leaf of a shrub. After obtaining these, he has no more need to range the forest. A quantity of the strongest Indian pepper is used; but this he has already planted round his hut. The pounded fangs of the Labarri snake, and those of the Connaocouchi, are likewise added. These he commonly has in store; for when he kills a snake, he generally extracts the fangs and keeps them by him. Having thus found the necessary ingredients, he scrapes the wourali vine and bitter root into thin shavings, and puts them into a kind of colander made of leaves; this he holds over an earthen pot, and pours water on the shavings; the liquor which comes through has the appearance of coffee. When a sufficient quantity has been procured, the shavings are thrown aside. He then bruises the bulbous stalks, and squeezes a proportionate quantity of their juice through his hands into the pot. Lastly, the snake's fangs, ants, and pepper, are bruised and thrown into it. It is then placed on a slow fire; and as it boils, more of the juice of the wourali is added, according as it may be found necessary, and the scum is taken off with a leaf. It remains on the fire till reduced to a thick scum of a deep brown colour. As soon as it has arrived at this state, a few arrows are poisoned with it to try its strength. If it answer the expectations, it is poured out into a calabash, or little pot of Indian manufacture, which is carefully covered with a couple of leaves, and over them a piece of deer's skin, tied round with a cord. They keep it in the most dry part of the hut, and from time to time suspend it over the fire to counteract the effects of dampness. Among the instances adduced of the extraordinary effects of the wourali poison, Waterton mentions the following:—A large well-fed ox, from nine hundred to a thousand pounds weight, was led to a stake by a rope sufficiently strong to allow him to move to and fro. In order to bring him down, three poisoned arrows were put into him; one was sent into each thigh, just above the hock, in order to avoid wounding a vital part, and a third was shot transversely into the extremity of the nostril. The poison seemed to take effect in four minutes. Conscious as though he would fall, the ox set himself firmly on his legs, and remained quite still in the same place, till about the fourteenth minute, when he smelled the ground, and appeared as if inclined to walk. He advanced a pace or two, staggered and fell, and remained extended on his side, with his head on the ground. His eye, a few minutes ago so bright and lively, now became fixed and dim; and though you put your hand close to it as if to give him a blow there, he never closed his eyelid. His legs were convulsed, and his head from time to time started involuntarily; but he never showed the least desire to raise it from

the ground. He breathed hard, and emitted foam from his mouth. The startings, or subalutis tendinum, now became gradually weaker and weaker; his hinder parts were fixed in death; and in a minute or two more, his head and fore-leg ceased to stir. Nothing now remained to show that life was still within him, except that his heart faintly beat and fluttered at intervals. In five-and-twenty minutes from the time of his being wounded, he was quite dead. His flesh was very sweet and savoury at dinner.

BEAR HUNTING.

We resumed the search for the bears, which we continued until near three o'clock, and until it was beginning to get dusk. At this time I was to the right of the line, which was proceeding in a westerly direction; when, in the distance to the northward, and in a part of the forest we had not yet beaten, I heard my old dog Pajjas giving tongue. I now lost not a moment, but leaving the people, ran as fast as the broken nature of the ground would permit, towards the spot where the dog was challenging, which might be at one hundred and fifty or two hundred paces distant. This was in a rather thick part of the forest; and in a clump of pines, around the foot of which, though at some paces distant—for he probably remembered the rough treatment he had received upon a former occasion—Pajjas still kept furiously baying. Though the dog had found the bears, I did not at the first moment observe the entrance to their den, which was an excavation in the face of a little rising, situated between, and partly formed by, the roots of the surrounding trees. But on discovering it, I at once sprang on to the top of the hillock; and though at that time immediately over the den, the bears still remained quiet. On my hallooing, they felt so little inclination to leave their quarters, that the old bear simply contented herself with partially projecting her snout. At this, from its being the only point exposed to my view, I levelled my rifle, which was then pointed in a perpendicular direction. On reflection, however, I refrained from firing, as I considered that, though I might have smashed the fore part of her head to pieces, there was little chance of my killing her outright. Instead, therefore, of firing whilst in that situation, I stepped (and it certainly was not "the most prudent step" a man ever took) with my left foot in advance, directly over her, to the opposite side of the hole, when wheeling about on the instant, and having then a full view of her head, from which the muzzle of my gun was hardly two feet distant, and my left foot still less, for it was partially in the entrance of the den itself, I sent a bullet through her skull. I now called loudly to the people, none of whom, nor even the other dogs, which had been questing to some birds in another part of the forest, had as yet come up—for I was rather apprehensive the cubs might attempt to make their escape. To prevent this, I stood for a while over the den in readiness to give them a warm reception with the butt-end of my rifle. But three or four minutes elapsed before Jan Finne, who was to the left of our line, Svensson, and the peasants, made their appearance; for, strange to say, though Pajjas had been in Jann Finne's possession for several years, he either did not recognise his challenge, or he had not a suspicion it was to the bears; and in consequence, neither he nor the people moved from where I had left them until they heard my shot. My apprehensions as to the cubs attempting to escape, were, however, groundless, for they still continued quiet; at first, indeed, we could see nothing of them, for the old bear, who, as is usual with those animals when they have young, was lying in the front of the den, and we therefore almost began to think we had hit upon a bear distinct from those of which we were in search. But on the people introducing a stake, and moving the old bear a little to the side, one of the cubs, and subsequently a second, and a third, exhibited themselves, all of which I dispatched, either with my own or with Jan Finne's rifle. The work of death being at length completed, we drew the bears out of their den.—*Lloyd.*

TURKEY.

After some hours' stay, we proceeded up the Dardanelles, Europe on one side and Asia on the other; and soon Turkey opened on us with its loveliest scenery. I do not know if I can convey a proper idea of it, it is so different from that of Europe. What gives a peculiar beauty to the Turkish towns and villages, is their being so embosomed in trees. You always see these of the liveliest verdure, hanging over and shading the greatest part of the houses. The habitations are rather low, and built generally of wood, with gently sloping roofs; they are either of a red, white, or lead colour, with windows of framework of wood. The neat white minaret of the mosque rises eminent amidst every village. The country was rich in many parts with corn, which had been already cut; and a cool kiosk was seen, shaded with its luxuriance of wood. But all this only whetted my impatience to behold Stamboul, as the Turks call it; and night came down again to augment it. For the last few days the sky had become more beautiful, of a most delicate blue, bounded near the horizon by a ridge of white clouds; and the last day of our voyage was particularly fine, when a gentle breeze brought us towards the capital of the East. The first view rather disappoints you; the surrounding shores are not striking, and you are inclined to ask, where is the magnificence of Constantinople? But when you enter the canal, and turn the point where stands the seraglio, and the site of the city, being built on decli-

vities, rises higher, so that houses appear to range on houses—and Pera and Galata, with the immense dark grove of cypresses on the place of graves that crowns the hill, open to your view—you are struck with admiration. The houses of wood, of which the city is chiefly built, have indeed nothing grand in their appearance; three-fourths of the fronts are taken up with windows. But it is the novel and beautiful blending of trees and verdure with every part; the innumerable minarets, some with gilded tops that glitter in the sun; and the superior mosques, of a nobler appearance, and towering above all other buildings—which impress the mind of a stranger with feelings unknown at the sight of any other European city. Our vessel being bound for Odessa, proceeded up the river to the village of Buyukdere, a few miles distant, celebrated for its beauty. This afforded an excellent opportunity to view the scenery; and few who have once done this can ever forget it. Each side of the river—a noble stream, of a mile, or sometimes half that in width—was thickly covered with habitations. In one part was a mosque of the purest white marble, most richly ornamented and gilded, and the dark cypress around it. On the left, a summer seraglio of the sultan, with its small pleasure-ground, stretched along the shore. The hills on the European side, descending nearly close to the river, and prettily wooded, yet so small that they looked in miniature; and the little Turkish houses standing in the river, or hanging in parapets over it, or thrown back in a retiring wood—put you in mind of what you had imagined of Chinese scenery and dwellings. My view often wandered with delight over the Asiatic side, as the scene of future pleasures. "At last," I said to myself, "my long-cherished hopes are accomplished; it is all Oriental, I see; but my expectations are surpassed."—*Carne's Letters from the East.*

THE VATICAN.

Unlike the sombre aspect generally characterising libraries, museums, and similar resorts of the studious, the Vatican is as a world of exquisite beauty, vast, splendid, filled with the most admired works of art and the most precious marbles. The lengthened vista, the varied perspective changing at each advancing step, the noble architectural proportions still preserved in every new form or dimension of apartment, the lofty iron gates, the beautiful fountains adorning the courts, and cooling the air with the play of their fresh running waters, the white balustrades, the pillars and magnificent columns, composed of gaily antique, and every richest marble, almost produce the idea of enchantment; and the eye wanders around in eager curiosity, with amazement and delight. Light is beautiful; and here it is seen, bright and sparkling, reflected from pure and precious marbles; while from the wide-spreading windows the most delightful views of Rome, rich with her cupolas, spires, and obelisks, in every varied form of architecture, with her sea-green Campagna, bounded by the dark grey mountains fading in the distance, are presented to the eye. It is the noblest national possession in the world, and should ever be sacred. The mind of man is, I trust, now so well informed, that no barbarous conqueror will ever again dare to touch it with a profane hand.—*Bell's Italy.*

TWO USEFUL RECEIPTS.

Fumigating Mixture.—Two ounces of salt dried, two ditto of nitre. Mix and put to them in a stone-basin or plate, a half-ounce of water, and the same quantity of good sulphuric acid. Remove all polished-metal articles from the room, as the vapour would rust them, and close all doors and windows. To procure more advantage, when the process appears to cease, place the basin on hot sand.

Cheep Stew-soup.—Two pounds of beef, four onions, ten turnips, half a pound of rice, a large handful of parsley, thyme, and savoury; some pepper and salt; eight quarts of water. Cut the beef in slices, and after it has boiled some time, cut it still smaller. The whole should boil gently about two hours on a slow fire. If fuel be scarce, it may be stewed all night in an oven, and warmed up next day. You may add oatmeal and potatoes. Grey peas will be a great addition.—*Mrs Hannah More.*

HYMN OF THE BRITISH PEASANT

For the pride of our fields, for our garden-decked land,
For our valleys and rivers, the works of thy hand,
We praise thee, we bless thee, our Father, our God,
We praise thee, we bless thee, our Father, our God!
For the fragrance of morn, for the lark's early song,
That bids us from slumber awake and be strong;
For the dew, for the clouds, for the day's varied sight,
We praise thee, we bless thee, the Fountain of Light.
For the sweets of our toil, for the oak's covert shade,
'Neath whose breathings at noontide our banquet is laid:
For the strength of our limbs, for our cheek's joyous glow,
We praise thee, who crownest the sweet of our brow.
For evening's calm hour, when our labour is done,
For the fond little crowds, from each cottage that run,
For their greetings of love, when around us they come,
We praise thee, we bless thee, who giv'st us our home.
For our Sabbaths and Churches, thy Spirit's abode,
Where the old and the young swell the chorus to God;
For each holy transport that kindles us there,
We praise thee, we bless thee, the quickener of prayer.
For the promise of spring, for thy Summer's proud state,
For the glories of harvest, for Autumn's rich weight;
For the wood-fires of winter, so gladdening and clear,
We praise thee, we bless thee, who rulest the year.
For the kind British hearts, ever joying to give,
For the friends of the poor, amid whom we live,
We praise thee, we bless thee, our Father, our God,
We praise thee, we bless thee, our Father, our God!
—*Albion Newspaper.*

AMERICAN MUSQUITOES.

The mosquitoes seldom annoyed us at mid-day; but when we wished to enjoy the refreshing coolness of a morning or evening's walk, they fastened on us with their infernal stings, against which we had no defence except leather. By smoking, we might indeed keep them at a civil distance from our noses and the parts thereunto adjacent; but this was a preventive which, if constantly practised, would have in a short time reduced our tobacco to a small quantity. The annoyance during our meals was worse. We were obliged to have an iron pot at each end of the table, filled with sawdust or rotten wood; which substance, when ignited, produced a quantity of thick smoke without flame. It effectually drove them away, but it was a desperate remedy; for during the process of mastication we were nearly suffocated from the dense clouds of vapour by which we were enveloped. In the meantime, our tormentors hovered about the doors and windows, watching the gradual dispersion of the smoke; and the moment the atmosphere became sufficiently clear, they charged in from all directions on our heads, necks, ears, faces, and hands, from whence it was impossible to dislodge them, until a fresh supply of sawdust, thrown over the dying embers, put them once more to flight. The horses also suffered severely from these insects and the horse flies. We caused several fires of rotten wood to be made in the prairie in which they were grazing, and round which they instinctively congregated to avail themselves of the protection afforded by the smoke. Those which had short tails and cropped manes suffered more than the others; for with these weapons of nature (of which, in America, at all events, it is cruel to deprive them) they could whisk off great numbers of the enemy; while the cropped horses, having no such defence, often had their hoofs and legs severely burned by standing in the fires to avoid the stings of their assailants. I have often observed the poor animals, when the smoke began to evaporate, gallop up to the fort, and neigh in the most significant manner for a fresh supply of damp fuel; and on perceiving the men appointed for that purpose proceed to the different fires, they followed them, and waited with the most sagacious patience until the smoke began to descend and disperse their tormentors.—*Coz's Columbia River.*

EFFECT OF LIGHT ON PLANTS.

It is known that the solar light, by favouring the assimilation of carbonic acid gas in plants, gives them the faculty of becoming green, and of forming the volatile and aromatic principles. These conditions are necessary to their flowering and fructification, inasmuch that ripe seeds have never been obtained from plants kept in darkness. If, on the contrary, bleached plants are exposed to the sun for three, four, or five hours, they become as intensely green as if they had been reared in the sun. Vegetables reared in the open air become pale, and fade in two or three hours, if they are transported to a dark place; but those which, after growing in the shade, have been exposed for some time to the sun, can no longer support the privation of light; and water, impregnated with camphor or essential oil, which is highly favourable to vegetation in other circumstances, does not prevent them from fading and perishing.

WOLVES.

The following circumstance, showing the savage nature of the wolf, and interesting in more than one point of view, was related to me by a gentleman of rank attached to the embassy at St Petersburg: it occurred in Russia some few years ago. A woman, accompanied by three of her children, were one day in a sledge, when they were pursued by a number of wolves. On this, she put the horse into a gallop, and drove towards her home, from which she was not far distant, with all possible speed. All, however, would not avail, for the ferocious animals gained upon her, and at last were on the point of rushing on the sledge. For the preservation of her own life and that of the remaining children, the poor frantic creature now took one of her babes, and cast it a prey to her blood-thirsty pursuers. This stopped their career for a moment; but, after devouring the little innocent, they renewed the pursuit, and a second time came up with the vehicle. The mother, driven to desperation, resorted to the same horrible expedient, and threw her ferocious assailants another of her offspring. To cut short this melancholy story, her third child was sacrificed in a similar manner. Soon after this, the wretched being, whose feelings may more easily be conceived than described, reached her home in safety. Here she related what had happened, and endeavoured to palliate her own conduct, by describing the dreadful alternative to which she had been reduced. A peasant, however, who was among the bystanders, and heard the recital, took up an axe, and with one blow cleft her skull in two; saying, at the same time, that a mother who could thus sacrifice her children for the preservation of her own life, was no longer fit to live. This man was committed to prison, but the emperor subsequently gave him a pardon.—*Lloyd's Field Sports of the North of Europe.*

NUMBER OF STARS.

Of the stars in the British catalogue, there are many only visible through a telescope, nor does the eye ever see more than a thousand at the same time in the clearest heaven; yet the number is probably infinite. From the first to the sixth magnitude, inclusive, the total number of stars is 3128.

Column for the Boys. ARCHERY.—Concluded.

The String.—The part of the string which receives the nock of the arrow is whipped with sewing silk to prevent the string being rubbed and weakened. If the silk should come off the string, it ought to be re-whipped without delay, otherwise it will be in danger of breaking; and this is not the only mischief, for from the breaking of a string oftentimes ensues the snapping of a bow. It is also advisable to whip the noose and eye of the string, although many archers do not trouble themselves to do so. At one end of the bow-string an eye is made; it is left for the archer himself, bows being of different lengths, to make the other; this to a young archer will be found rather difficult; his best plan will be to inspect the mode of making the noose on an old string. The young archer will do well, if any of the threads of his string break, to throw it by and use another. He should never, if possible, permit the string to become twisted or ravelled; should such an occurrence take place, before it is put on again, it ought to be retwisted and waxed. A bow, five feet long when braced, should never have the string more than five inches from its centre. This rule will be a guide to the young archer in stringing his bow; whatever be its length, he will of course adjust the distance in the same proportion, according to the measurement.

The Quiver.—The quiver is for the reception of the arrows, but is never constantly worn, except in roving; it is now usually made of tin, although it is occasionally constructed, as was indeed universally the case formerly, of wood or leather.

The Belt, Pouch, and Grease-box.—The belt is buckled round the waist; the grease-box is suspended from the middle, and the pouch, or bucket, on the right side of it. A composition for greasing the finger of the shooting-glove, and the smooth side of the brace, when occasion may require, is kept in the box; the pouch holds the arrows for immediate use in target-shooting.

The Aschem.—This is a large case, fitted up with the necessary drawers and compartments for the reception of the bow, stock of arrows, strings, and all the necessary accoutrements of the archer.

Butts.—The butt, generally speaking, is rather pyramidal in shape, but it may be fashioned according to the fancy of the archer; for grown up persons, they are seven or eight feet wide, three or four feet thick at the top, and nearly seven feet in height at the middle. Butts are made of long plats of turf, which are to be closely pressed down; a round piece of pasteboard is placed in the centre of the butt for a mark, which must be increased or decreased in size, according to the distance at which the archer shoots; for thirty yards, it should be four inches in diameter; for sixty yards, six inches; and so in proportion for a greater distance. The mark is fixed to the butt by a peg driven through its centre. Shots that take place outside the mark are not reckoned, and he who places most shots in the pasteboard during the play, is accounted the winner. Butts are frequently placed at different distances from each other; a set of butts is four, which are so contrived as not to prevent the players seeing them all at once. What is called a single end is shooting at one mark only; a double end is shooting to a mark, and back again from that mark to the one first shot from.

Targets.—Targets should be proportioned to the size and skill of the juvenile archer, and to the distance at which he stands from them. The facing is usually made of canvass, which is sewed to the bass; the bass is made of straw, worked as a bee-hive. The facing has a gold centre and four circles; namely, the outer white edge with green and black; inner, white and red. Where it is not convenient to keep the targets fixed, it is better to use another kind, made of milled board, these being more portable, although by no means so durable, as targets made of the other materials we have mentioned. If one target only be shot at, a great deal of time is wasted in going to fetch the arrows, and again returning to the spot for shooting from; two targets are, therefore, generally used, and the archers shoot from one to the other. In archery matches, there are generally two prizes—one for the greatest number of arrows shot in the target, the other for the shot nearest the gold centre. Hits in the target are sometimes reckoned all alike; but there is usually a distinction made. The gold centre is the mark, and the circle which approaches nearest to it, being less in size, and consequently more difficult to hit, and nearer the main mark itself, an arrow shot in that circle is deemed of more value, in reckoning for the prize, than if it were to take place in any of those outside of it, and so on in proportion with the others. A celebrated society of archers allows the following numbers for each circle. For the gold, nine; for the red, seven; for the inner white, five; for the black, three; and for the outer white, one. A writer on this subject, however, seems to think that the outer circles are overrated; and if nine be allowed for the centre, only three should be scored for the red; two, for the inner white; and less, in proportion, for the two outer circles. When the sport terminates, the value of the number of hits, and not the hits themselves, should be reckoned; and he whose score is the largest, is of course the victor.

As ink is by no means a convenient thing to carry into the field, and marks made with the black lead pencil are liable to be rubbed out, it is advisable to have a pin suspended from a card, properly divided for each archer's score, and to prick down the hits with it.

Stringing the Bow.—The bow is to be taken in the right hand, by the handle, with the flat part toward the person who is about to string it; his right arm should rest against his side; one lower end of the bow, which has always the shortest bone, should be placed against the inside of the right foot, which should be turned a little inward to prevent the bow from slipping; the left foot should at the same time be brought forward; the centre of the left hand wrist must be placed on the upper limb of the bow below the eye of the string, the fore-

finger knuckle upon one edge of the bow, and the top of the thumb on the other. The bow is now to be pulled vigorously, and the upper limb of it pressed down by the right hand, and the wrist of the left, which should at the same time slide upward until the eye of the bowstring is safely placed on the nock. The middle, the ring, and the little fingers, should all three be stretched out, as they are not wanted in this operation of stringing the bow; moreover, if this be not done, they are liable to be caught between the string and the bow, and thus become severely punished. The young archer should take care that the eye is well placed in the nock before he removes his left hand. He should not become impatient in the action of stringing the bow, but perform it systematically as directed; if he do not succeed, let him lay it by for a few minutes, and when he is cool, make a second attempt. To unstring the bow, the short horn is to be placed on the ground, the palm of the left hand receiving the flat side of the upper limb; the string should be upward: the handle is then to be pressed with the right arm so as to slacken the string; when the latter becomes loose enough, the eye is to be brought out of the nock, by the thumb of the left hand.

Position.—The face is to be turned toward the mark, but no part of the body, which, if the mark be north, should be turned toward the east; the head should be rather inclined; the left hand, with the bow in it in a perpendicular position, is to be held out straight toward the mark; the arrow is to be brought well toward the ear and not the eye, on the left side of the bow and under the string; the fore-finger of the left hand passes over it; by the other hand the nock is placed in the string at the proper place, with the cock feather uppermost; when this is done, the fore-finger of the left hand is removed and placed round the bow. While the left hand is raising the bow, the right should be drawing the string with two or three fingers only, and not the thumb; as soon as it reaches the head, it should be let loose for fear of its breaking.

Great care should be taken to acquire a proper position, for bad attitudes in archery appear extremely ridiculous.

Clout Shooting.—Clout shooting is mostly practised by those who cannot conveniently set up butts or targets near home. The clout, which is quite portable, is made of a round piece of pasteboard, thirty-six inches in circumference, fastened to a stick; or it may be made of white cloth, so contrived as to roll up on a stick that is run through it. In clout shooting, seven is the game, and all arrows tell that fall within three bows' length of the clout.

USE OF CAT'S WHISKERS.

Every one must have observed what are usually called the whiskers on a cat's upper lip. The use of these in a state of nature is very important. They are organs of touch. They are attached to a bed of close glands under the skin; and each of these long and stiff hairs is connected with the nerves of the lip. The slightest contact of these whiskers with any surrounding object, is thus felt most distinctly by the animal, although the hairs are themselves insensible. They stand out on each side in the lion, as well as in the common cat; so that, from point to point, they are equal to the width of the animal's body. If we imagine, therefore, a lion stealing through a covert of wood, in an imperfect light, we shall at once see the use of these long hairs. They indicate to him, through the nicest feeling, any obstacle which may present itself to the passage of his body: they prevent the rustle of boughs and leaves, which would give warning to his prey, if he were to attempt to pass through too close a bush; and thus, in conjunction with the soft cushions of his feet, and the fur upon which he treads (the retractile claws never coming in contact with the ground), they enable him to move towards his victim with a stillness greater even than that of the snake, who creeps along the grass, and is not perceived till he is coiled round his prey.—*Library of Useful Knowledge.*

VEGETABLES.

In the early part of the reign of Henry VIII., not a cabbage, turnip, or other edible root, grew in England. Two or three centuries before, certainly, the monasteries had gardens with a variety of vegetables; but nearly all the gardens of the laity were destroyed in the wars between the houses of York and Lancaster. Harrison speaks of wheat bread as being chiefly used by the gentry for their own tables; and adds, that the artificer and labourer are "driven to content themselves with horse-corne, beans, peason, oats, tares, and lentils." There is no doubt that the average duration of human life was at that period not one half as long as at the present day. The constant use of salted meat, with little or no vegetable addition, doubtless contributed to the shortening of life, to say nothing of the large numbers constantly swept away by pestilence and famine. Till lemon juice was used as a remedy for scurvy amongst our seamen, who also are compelled to eat salted meat without green vegetables, the destruction of life in the navy was something incredible. Admiral Hosier buried his ship's companies twice during a West India voyage, in 1726, partly from the unhealthiness of the Spanish coast, but chiefly from the ravages of scurvy. Bad food and want of cleanliness swept away the people of the middle ages, by ravages upon their health that the limited medical skill of those days could never resist. Matthew Paris, a historian of that period, states that there were in his time twenty or thirty hospitals for lepers in Europe.—*Working Man's Companion*, No. XIII.

CHEESE-HOPPERS.

Those who have, from popular associations, been accustomed to look with disgust at the little white larvæ common in cheese, well known under the name of hoppers, will be somewhat surprised to hear the illustrious Swammerdam say, "I can take upon me to affirm that the limbs and other parts of this maggot are so uncommon and elegant, and contrived with so much art and design, that it is impossible not to acknowledge them to be the work of infinite power and wisdom, from which nothing is hid, and to which nothing is impossible." The cheese-fly (*Piophilæ Casei*, Fallen) is very small and black, with whitish wings, warped with black. It was one of those experimented upon by Redi, to prove that insects, in the fabric of which so much art, order, contrivance, and wisdom, appear, could not be the production of chance, or rottenness, but the work of the same omnipotent hand which created the heavens and the earth. This tiny little fly is accordingly furnished with an admirable instrument for depositing its eggs, in an ovipositor, which it can thrust out and extend to a great length, so that it can penetrate to a considerable depth into the cracks of the cheese, where it lays its eggs, 256 in number. Its powers of leaping have been observed by every one. It bends itself into a circle, catches the skin near its tail with its hooked mandibles, and after strangely contracting itself from a circular into an oblong form, it throws itself with a jerk into a straight line, and thus makes the leap. Well may Swammerdam denominate these contrivances "surprising miracles of God's power and wisdom in this abject creature." Like other destructive insects, the multiplication of the cheese-hopper is checked by some insect whose history is not yet known.—*Library of Entertaining Knowledge.*

ASTRONOMY AND CELESTIAL MECHANICS.

Astronomy, as a science of observation, is known to have made considerable progress among the ancients; indeed it was the only branch of physical science which could be regarded as having been cultivated by them with any degree of assiduity or real success. The Chaldean and Egyptian records had furnished materials from which the motions of the sun and moon could be calculated with sufficient exactness for the prediction of eclipses; and some remarkable cycles, or periods of years in which the lunar eclipses return in very nearly the same order, had been ascertained by observation. Considering the extreme imperfection of their means of measuring time and space, this was, perhaps, as much as could have been expected at that early period, and it was followed up for a while in a philosophical spirit of just speculation, which, if continued, could hardly have failed to lead to sound and important conclusions. Unfortunately, however, the philosophy of Aristotle laid it down as a principle, that the celestial motions were regulated by laws proper to themselves, and bearing no affinity to those which prevail on earth. By thus drawing a broad and impassable line of separation between celestial and terrestrial mechanics, it placed the former altogether out of the pale of experimental research, while it at the same time impeded the progress of the latter by the assumption of principles respecting natural and unnatural motions, hastily adopted from the most superficial and cursory remarks, underserving even the name of observation. Astronomy, therefore, continued for ages a science of mere record, in which theory had no part, except in so far as it attempted to conciliate the inequalities of the celestial motions with that assumed law of uniform circular revolution, which was alone considered consistent with the perfection of the heavenly mechanism.—*Herschel.*

AMSTERDAM.

This city has been formed since the third century. It derives its name from the river Amstet, on whose banks it is situated, and the enormous dam that opposes the inroads of the sea, on a country snatched from its lawful dominion. The whole town, which is nine miles in circumference, stands on piles driven into the mud. Under the town-house alone are thirteen thousand six hundred and ninety-five. Well might Erasmus say that he had reached a city whose inhabitants lived like crows on the tops of trees! Ninety small islands, united by two hundred and ninety bridges, form the site of the town, which contains a population of about two hundred and five thousand souls, of which one-tenth are Jews. Owing to the number of canals, and the quantity of stagnant water in the vicinity, the air would be still more prejudicially affected than it is, were it not for mills which are kept constantly at work to communicate an artificial motion to the water. Several of these are employed likewise to draw up the mud brought down by the Y to its junction with the Amstet, which, but for this precaution, would block up the passage of the river.—*Elliot's North of Europe.*

EDINBURGH: Published, weekly, by W. and R. CHAMBERS, 19, Waterloo Place; ORR & SMITH, Paternoster-row, London; and YOUNG AND CUNNINGHAM, Dublin. Agent in Glasgow, JOHN MACLEOD, 20, Argyle Street; and sold by all other Booksellers in Great Britain and Ireland.—"Chambers's Historical Newspaper," a Supplement to the present publication, is published on the first of every month; and "Chambers's Information for the People," of which every number is a distinct branch of human knowledge, appears once every fortnight.—Subscribers in Edinburgh may have these papers left at their houses as they appear, by giving their addresses at 19, Waterloo Place, and paying subscriptions for a quarter, a half year, or a year, in advance.—Price of a quarter of the Journal, 1s. 6d.

From the Steam-press of W. and R. Chambers.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM CHAMBERS, AUTHOR OF "THE BOOK OF SCOTLAND," "GAZETTEER OF SCOTLAND," &c.

No. 4.

SATURDAY, FEBRUARY 25, 1832.

PRICE THREE HALFPENCE.

SCOTLAND IN EARLY TIMES.

If the readers of the Journal have found matter of agreeable and instructive reflection in the account which has already been partly given of the overthrow of Celtic usages in Scotland in the eleventh century, and the establishment of those of an Anglo-Saxon or Gothic race, the following observations on a subject of fully greater importance will probably be perused with not less entertainment and edification.

The history of the Scottish people has usually been divided by antiquaries into a number of *periods*, corresponding with the political supremacy of particular classes of men: as, the Roman period—the Pictish period—the Scottish period—and the Soto-Saxon period; but it seems more convenient for the present purpose to assume only three great eras, corresponding with three important events occurring at the distance of some centuries from each other. The first takes its rise in the overthrow of Druidism, or Paganism, and the introduction of Christianity; the second, in the overthrow of Celtic usages, and the introduction of the great Anglo-Saxon and Norman families, along with the English language; and the third commences with the abolition of the heritable jurisdictions, about the middle of the last century. Each of these events, in a greater or less degree, peacefully changed the tone and character of society, and that to a far greater extent than has usually been attendant on the alteration of a ruling dynasty. The introduction of Christianity into Scotland is an event which I am willing to believe cannot be mentioned without exciting sensible feelings of emotion in the mind of every individual whose eye glances over these pages. If that individual have already enlisted himself to fight as a soldier in the ranks of Christian chivalry, he will no doubt ponder with gratitude on a transaction which has powerfully influenced his prospects as to another state of existence; and if, on the other hand, he be an intelligent disbeliever, he will examine with feelings of equal thankfulness, and not a small degree of curiosity, a circumstance which assuredly laid the basis of that degree of civilisation and mental improvement with which, by little exertion on his part, he happens to be endowed.

The religion which we now profess underwent three centuries of adversity, but throve under every species of persecution; and it was not till the year 306, in the reign of Constantine, the first Christian emperor of Rome, that it could be said to be openly or officially countenanced in Europe. From the period of its earliest promulgation in what is now an obscure country in Asia, it had, however, been zealously propagated under every kind of tyrannic oppression, by a body of enthusiastic missionaries, the first of whom have been described under the title of *apostles*, while their immediate successors have been generally called *fathers* or *saints*. These active but humble missionaries of Christianity, following the rule prescribed for the regulation of their conduct, carried with them neither purse nor scrip, trusting to the compassion or beneficence of their converts for the necessary supply of food and raiment. Issuing from the already desecrated territory of Judea, or receiving their commission and instructions from persons who themselves had, perhaps, been educated in that distracted region, these intrepid and fearless pioneers of Christianity penetrated through the iron legions of Rome, and the natural fastnesses of Gaul, till at length their voices were heard on the uttermost boundaries of Celtic and Gothic Europe, and were mingled with the murmurs of the ocean on the shores of its most remote islands.

When the sound of Christianity first broke upon the ear of the British savage, the island, like Gaul

from whence it was immediately peopled, owned the religion of the Druids. It was the opinion of a classic, or Grecian writer, called Diogenes Laertius, that the tenets of the Druids might be comprehended under four heads:—to worship God; to abstain from evil; to exert courage; and to believe in the immortality of the soul, for enforcing all these virtues. But if these were the original tenets of the Druids, it is too certain that they latterly degenerated into very gross superstition and abuse. The most horrid of their rites consisted in human sacrifices; yet it is mentioned, that such were offered up only on the most solemn and important occasions. The victim or victims—for there were sometimes several—were enclosed in a large figure resembling a man, formed of osier twigs, like basket work; or, according to some authors, they were simply wrapped round with hay. In this state fire was applied, and they were reduced to ashes. Pliny, a Roman author, who wrote upon Britain, asserts that they considered it as a solemn and unavoidable duty to put men to death; and that to feed upon their dead bodies they esteemed most wholesome. It is generally, and I think correctly, imagined that the Druidic religion of the Celts was brought along with various characteristic usages from Asia, at the period of the dispersion of the human race, for it has been found to bear a resemblance to the religious ceremonial of the Persian Magi, and that of still more barbarous nations in different parts of the Old World. The term *Druid* is of difficult etymology, but is supposed to have been derived from *Dar-gwyz*, signifying a theologian, or one who has knowledge; and hence, probably, the eastern term *Dervise*.

Among the priests of Druidism there appear to have been three orders—the Druids, the Vates, and the Bards, who severally performed their different functions. The bards sang, in heroic verse, the brave actions of eminent men; the Vates studied continually, and explained the productions and laws of nature; while the Druids, who were of a higher order, directed the education of youth, officiated in the affairs of religion, and presided in the administration of justice. Whatever may have been the speculative opinions of the Druids, they assuredly taught the duties of moral virtue, and enforced the precepts of natural religion. They inculcated a strong desire of liberty, with an ardent love of country, which strikingly appeared in the struggle for both, which was made against the Roman armies by the Gauls, by the Britons, and, above all, by the Caledonians. A peculiar principle of the Druids enjoined that no temple or covered building should be erected for public worship; for the sun being the great medium, rather than the object, of their adoration, to have shut out that luminary during their religious services, would have been inconsistent with their professed principles. Neither did the Druids ever erect any image of their Deity, nor did they communicate with the Greeks or Romans in the multiplicity of their local gods, or in the grossness of their general idolatry. The religious services of this remarkable people were invariably performed in the recesses of groves of oak trees, amid circles or ovals of huge upright stones, and on altars, or *cromlechs*, of the same rough cold material. The number and variety of the Druid remains in North Britain are almost endless. The stone enclosures are sometimes formed of a single circle, and often of double and treble concentric circles of upright stones. The principal seat of Druidism, as appears from such testimonials, seems to have been the recesses of Perthshire, near the Grampian range. Among the vast variety of Druid monuments in North Britain, one of the most interesting is the *rocking-stone*, which seems to

have existed in almost every country in Europe. This extraordinary monument of human ingenuity and cunning was evidently introduced after the sublime truths of Druidism had been contaminated by the grossness of superstition, and the pure adoration of the Deity had degenerated into delusive imposition. These rocking-stones, whether natural or artificial, were thus then brought in either to induce belief or to heighten devotion; and of such huge and lasting materials were they composed, that, even after a lapse of two thousand years, they maintain their pristine substantiality, and can still be moved by the finger of the most delicate lady, as well as they could have been by the hand of the officiating Druidic priest. The Welsh, the Derbyshire, the Yorkshire, the Cornish, the Irish, and the Scottish rocking-stones, are all erected on a similar plan. In the parish of Kirkmichael, in Perthshire (Stat. Acco. V. xv. p. 517), there is (or was lately) a large rocking-stone, which stands on a flat-topped eminence, in the vicinity of a large body of Druidic remains, the stone being placed on the plain surface of a rock level with the ground. It is a very hard, solid whinstone, of a quadrangular shape, approaching to the figure of a rhombus, of which the greater diagonal is seven feet, and the less five feet; its mean thickness is about two and a half feet, and its solid contents must therefore be 51,075 cubic feet; its weight must be about three tons and a half—the calculation being, that a stone of the same quality weighs eight stones three pounds the cubic foot. This mass of stone is nicely poised on one of its corners; and by pressing down either of the outer extremities, a rocking motion is produced, which may be increased so as to make the distance between their lowest depression and highest elevation a full foot. This stone makes twenty-six or more vibrations from one side to the other after the pressure is wholly withdrawn. On a hill in the parish of Kells, stewardry of Kirkcudbright, there is a vast rocking-stone, which, from its size, must be eight or ten tons weight, and it is so nicely balanced, that it can be easily set in motion. This stone, says Grose, is called by the country people the *Loggan Stone*, a name frequently given to such objects in Cornwall. It is not necessary to diverge into a regular examination of the Druidic remains of North Britain, which would be incompatible with a work of the present humble pretensions; but before leaving this branch of the subject, I must inform my readers of a few additional particulars necessary for their understanding some subsequent details on the popular antiquities of Scotland.—*To be continued.*

BRUNTFIELD.

A TALE OF THE SIXTEENTH CENTURY.

THE war carried on in Scotland, by the friends and enemies of Queen Mary, after her departure into England, was productive of an almost complete dissolution of order, and laid the foundation of many feuds, which were kept up by private families and individuals long after all political cause of hostility had ceased. Among the most remarkable quarrels which history or tradition has recorded as arising out of that civil broil, I know of none so deeply cherished or accompanied by so many romantic and peculiar circumstances, as one which took place between two old families of gentry in the neighbourhood of Edinburgh. Stephen Bruntfield, laird of Craighouse, had been a zealous and disinterested partisan of the queen. Robert Moubray of Barnbogle was the friend successively of Murray and Morton, and distinguished himself very highly in their cause. During the year 1572, when Edinburgh Castle was maintained by

Kirkaldy of Grange in behalf of the queen, Stephen Bruntfield held out Craighouse in the same interest, and suffered a siege from a detachment of the forces of the Regent, commanded by the laird of Barnbogle. This latter baron, a man of fierce and brutal nature, entered life as a younger brother, and at an early period chose to cast his fate among the Protestant leaders, with a view of improving his fortunes. The death of his elder brother in rebellion at Langside, enabled the Regent Murray to reward his services with a grant of the patrimonial estate, of which he did not scruple to take possession by the strong hand, to the exclusion of his infant niece, the daughter of the late proprietor. Some incidents which occurred in the course of the war had inspired a mutual hatred of the most intense character into the breasts of Bruntfield and Moubray; and it was therefore with a feeling of strong personal animosity, as well as of political rancour, that the latter undertook the task of watching the motions of Bruntfield at Craighouse. Bruntfield, after holding out for many months, was obliged, along with his friends in Edinburgh Castle, to yield to the party of the Regent. Like Kirkaldy and Maitland of Lethington, he surrendered upon a promise of life and estate; but while his two friends perished, one by the hand of the executioner, the other by his own hand, he fell a victim to the stateless spite of his personal enemy, who, in conducting him to Edinburgh as a prisoner, took fire at some bitter expression on the part of the captive, and smote him dead upon the spot.

Bruntfield left a widow and three infant sons. The lady of Craighouse had been an intimate of the unfortunate Mary, from her early years; was educated with her in France, in the Catholic faith; and had left her court to become the wife of Bruntfield. It was a time calculated to change the natures of women, as well as of men. The severity with which her religion was treated in Scotland, the wrongs of her royal mistress, and finally the sufferings and death of her husband, acting upon a mind naturally enthusiastic, all conspired to alter the character of Marie Carmichael, and substitute for the rosy hues of her early years, the gloom of the sepulchre and the penitentiary. She continued, after the restoration of peace, to reside in the house of her late husband; but though it was within two miles of the city, she did not for many years re-appear in public. With no society but that of her children, and the persons necessary to attend upon them, she mourned in secret over past events, seldom stirring from a particular apartment, which, in accordance with a fashion by no means uncommon, she had caused to be hung with black, and which was solely illuminated by a lamp. In the most rigorous observances of her faith she was assisted by a priest, whose occasional visits formed almost the only intercourse which she maintained with the external world. One strong passion gradually acquired a complete sway over her mind.—REVENGE—a passion which the practice of the age had invested with a conventional respectability, and which no kind of religious feeling, then known, was able either to check or soften. So entirely was she absorbed by this fatal passion, that her very children at length ceased to have interest or merit in her eyes, except in so far as they appeared likely to be the means of gratifying it. One after another, as they reached the age of fourteen, she sent them to France, in order to be educated; but the accomplishment to which they were enjoined to direct their principal attention was that of martial exercises. The eldest, Stephen, returned, at eighteen, a strong and active youth, with a mind of little polish or literary information, but considered a perfect adept at sword-play. As his mother surveyed his noble form, a smile stole into the desert of her wan and widowed face, as a winter sunbeam wanders over a waste of snows. But it was a smile of more than motherly pride: she was estimating the power which that frame would have in contending with the murderous Moubray. She was not alone pleased with the handsome figure of her first-born child: but she thought with a fiercer and faster joy upon the appearance which it would make in the single combat against the slayer of his father. Young Bruntfield, who, having been from his earliest years trained to the purpose now contemplated by his mother, rejoiced in the prospect, now lost no time in preferring before the king a charge of murder against the laird of Barnbogle, whom he at the same time challenged, according to a custom then not altogether abrogated, to prove his innocence in single combat. The king having granted the necessary licence, the fight took place in the royal park, near the palace; and, to the surprise of all assembled, young Bruntfield fell under the powerful sword of his adversary. The intelligence was communicated to his mother at Craighouse, where she was found in her darkened chamber, prostrate before an image of the Virgin. The priest who had been commissioned to break the news, opened his discourse in a tone intended to prepare her for the worst; but she cut him short at the very beginning with a frantic exclamation—"I know what you would tell—the murderer's sword has prevailed, and there are now but two, instead of three, to redress their father's wrongs!" The melancholy incident, after the first burst of feeling, seemed only to have concentrated and increased that passion by which she had been engrossed for so many years. She appeared to feel that the death of her eldest son only formed an addition to that debt which it was the sole object of her existence to see

discharged. "Roger," she said, "will have the death of his brother, as well as that of his father, to avenge. Animated by such a double object, his arm can hardly fail to be successful."

Roger returned about two years after, a still handsomer, more athletic, and more accomplished youth than his brother. Instead of being daunted by the fate of Stephen, he burned but the more eagerly to wipe out the injuries of his house with the blood of Moubray. On his application for a licence being presented to the court, it was objected by the crown lawyers that the case had been already closed by *mal fortune* of the former challenger. But while this was the subject of their deliberation, the applicant caused so much annoyance and fear in the court circle by the threats which he gave out against the enemy of his house, that the king, whose inability to procure respect either for himself or for the law is well known, thought it best to decide in favour of his claim. Roger Bruntfield, therefore, was permitted to fight in barras with Moubray; but the same fortune attended him as that which had already deprived the widow of her first child. Slipping his foot in the midst of the combat, he reeled to the ground, embarrassed by his cumbrous armour. Moubray, according to the barbarous practice of the age, immediately sprang upon and dispatched him. "Heaven's will be done!" said the widow, when she heard of the fatal incident; "but, *gratias Deo!* there still remains another chance."

Henry Bruntfield, the third and last surviving son, had all along been the favourite of his mother. Though apparently cast in a softer mould than his two elder brothers, and bearing all the marks of a gentler and more amiable disposition, he in reality cherished the hope of avenging his father's death more deeply in the recesses of his heart, and longed more ardently to accomplish that deed than any of his brothers. His mind, naturally susceptible of the softest and tenderest impressions, had contracted the enthusiasm of his mother's wish in its strongest shape; as the fairest garments are capable of the deepest stain. The intelligence, which reached him in France, of the death of his brothers, instead of bringing to his heart the alarm and horror which might have been expected, only braced him to the adventure which he now knew to be before him. From this period, he forsook the elegant learning which he had heretofore delighted to cultivate. His nights were spent in poring over the memoirs of distinguished knights—his days were consumed in the tilt-yard of the sword-player. In due time he entered the French army, in order to add to mere science that practical hardihood, the want of which he conceived to be the cause of the death of his brothers. Though the sun of chivalry was now declining far in the occident, it was not yet altogether set: Montmorency was but just dead; Bayard was still alive—Bayard, the knight of all others who has merited the motto, "*sans peur et sans reproche*." Of the lives and actions of such men, Henry Bruntfield was a devout admirer and imitator. No young knight kept a firmer seat upon his horse—none complained less of the severities of campaigning—none cherished lady's love with a fonder, purer, or more devout sensation. On first being introduced at the court of Henry III., he had signalled, as a matter of course, Catherine Moubray, the disinherited niece of his father's murderer, who had been educated in a French convent by her other relatives, and was now provided for in the household of the queen. The connection of this young lady with the tale of his own family, and the circumstance of her being a sufferer in common with himself by the wickedness of one individual, would have been enough to create a deep interest respecting her in his breast. But when, in addition to these circumstances, we consider that she was beautiful, was highly accomplished, and, in many other respects, qualified to engage his affections, we can scarcely be surprised that *that* was the result of their acquaintance. Upon one point alone did these two interesting persons ever think differently. Catherine, though inspired by her friends from infancy with an entire hatred of her cruel relative, contemplated, with fear and aversion, the prospect of her lover being placed against him in deadly combat, and did all in her power to dissuade him from his purpose. Love, however, was of little avail against the still more deeply rooted passion which had previously occupied his breast. Flowers thrown upon a river might have been as effectual in staying its course towards the cataract, as the gentle entreaties of Catherine Moubray in withholding Henry Bruntfield from the enterprise for which his mother had reared him—for which his brothers had died—for which he had all along moved and breathed.

At length, accomplished with all the skill which could then be acquired in arms, glowing with all the earnest feelings of youth, Henry returned to Scotland. On reaching his mother's dwelling, she clasped him, in a transport of varied feeling, to her breast, and for a long time could only gaze upon his elegant person. "My last and dearest," she at length said, "and thou too art to be adventured upon this perilous course! Much have I bethought me of the purpose which now remains to be accomplished. I have not been without a sense of dread lest I be only doing that which is to sink my soul in flames at the day of reckoning; but yet there has been that which comforts me also. Only yesternight I dreamed that your father appeared before me. In his hand he held a bow and three goodly shafts—at a distance appeared the fierce and sanguinary

Moubray. He desired me to shoot the arrows at that arch traitor, and I gladly obeyed. A first and a second he caught in his hand, broke, and trampled on with contempt. But the third shaft, which was the fairest and goodliest of all, pierced his guilty bosom, and he immediately expired. The reverend shade at this gave me an encouraging smile, and withdrew. My Henry, thou art that *third arrow*, which is at length to avail against the shedder of our blood. The dream seems a revelation, given especially that I may have comfort in this enterprise, otherwise so revolting to a mother's feelings."

Young Bruntfield saw that his mother's wishes had only imposed upon her reason, but he made no attempt to break the charm by which she was actuated, being glad, upon any terms, to obtain her sanction for that adventure to which he was himself impelled by feelings considerably different. He therefore began, in the most deliberate manner, to take measures for bringing on the combat with Moubray. The same legal objections which had stood against the second duel were maintained against the third; but public feeling was too favourable to the object to be easily withstood. The laird of Barnbogle, though somewhat past the bloom of life, was still a powerful and active man, and, instead of expressing any fear to meet this third and more redoubted warrior, rather longed for a combat which promised, if successful, to make him one of the most renowned swordsmen of his time. He had also heard of the attachment which subsisted between Bruntfield and his niece; and, in the contemplation of an alliance which might give some force to the claims of that lady upon his estate, found a deeper and more selfish reason for accepting the challenge of his youthful enemy. King James himself protested against stretching the law of the *per duellum* so far; but, sensible that there would be no peace between either the parties or their adherents till it should be decided in a fair combat, he was fain to grant the required licence.

The fight was appointed to take place on Cramond Inch, a low grassy island in the Frith of Forth, near the Castle of Barnbogle. All the preparations were made in the most approved manner by the young Duke of Lennox, who had been the friend of Bruntfield in France. On a level space, close to the northern beach of the islet, a space was marked off, and strongly secured by a paling. The spectators, who were almost exclusively gentlemen, (the rabble not being permitted to approach), sat upon a rising ground beside the enclosure, while the space towards the sea was quite clear. At one end, surrounded by his friends, stood the laird of Barnbogle, a huge and ungainly figure, whose features displayed a mixture of ferocity and hypocrisy, in the highest degree unpleasant. At the other, also attended by a host of family allies and friends, stood the gallant Henry Bruntfield, who, if divested of his armour, might have realised the idea of a winged Mercury. A seat was erected close beside the barras for the Duke of Lennox and other courtiers, who were to act as judges; and at a little distance upon the sea lay a small decked vessel, with a single female figure on board. After all the proper ceremonies which attended this strange legal custom had been gone through, the combatants advanced into the centre, and, planting foot to foot, each with his heavy sword in his hand, awaited the command which should let them loose against each other, in a combat which both knew would only be closed with the death of one or other. The word being given, the fight commenced. Moubray, almost at the first pass, gave his adversary a cut in the right limb, from which the blood was seen to flow profusely. But Bruntfield was enabled, by this mishap, to perceive the trick upon which his adversary chiefly depended, and, by taking care to avoid it, put Moubray nearly *hors de combat*. The fight then proceeded for a few minutes, without either gaining the least advantage over the other. Moubray was able to defend himself pretty successfully from the cuts and thrusts of his antagonist, but he could make no impression in return. The question then became one of time. It was evident that, if no lucky stroke should take effect beforehand, he who first became fatigued with the exertion would be the victim. Moubray felt his disadvantage as the elder and bulkier man, and began to fight most desperately, and with less caution. One tremendous blow, for which he seemed to have gathered his last strength, took effect upon Bruntfield, and brought him upon his knee, in a half-stupified state; but the elder combatant had no strength to follow up the effort. He reeled towards his youthful and sinking enemy, and stood for a few moments over him, vainly endeavouring to raise his weapon for another and final blow. Ere he could accomplish his wish, Bruntfield recovered sufficient strength to draw his dagger, and thrust it up to the hilt beneath the breastplate of his exhausted foe. The murderer of his race instantly lay dead beside him, and a shout of joy from the spectators hailed him as the victor. At the same instant, a scream of more than earthly note arose from the vessel anchored near the island; a lady descended from its side into a boat, and, rowing to the land, rushed up to the bloody scene, where she fell upon the neck of the conqueror, and pressed him, with the most frantic eagerness, to her bosom. The widow of Stephen Bruntfield at length found the yearnings of twenty years fulfilled—she saw the murderer of her husband, the slayer of her two sons, dead on the sword before her while there still survived to her as noble a child as ever blessed a mother's arms. But the revulsion of feeling produced by the event was too much for her strength; or, rather,

Providence, in its righteous judgment, had resolved that so unholy a feeling as that of revenge should not be too signally gratified. She expired in the arms of her son, murmuring "Nunc dimittis, Domine," with her latest breath.

The remainder of the tale of Bruntfield may be easily told. After a decent interval, the young laird of Craighouse married Catherine Moubray; and as the king saw it right to restore that young lady to a property originally forfeited for service to his mother, the happiness of the parties might be considered as complete. A long life of prosperity and peace was granted to them by the kindness of Heaven; and at their death they had the satisfaction of enjoying that greatest of all earthly blessings, the love and respect of a numerous and virtuous family.

The tale of Bruntfield is founded upon facts alluded to in the following extracts:—

(From *Birrell's Diary*.)

"1596, the 22d day of December, Stephin Bruntfield slain upon St Leonard's Craiges, as apieris, be James Carmichael, second son of the Laird of Carmichael [ancestor of the Hyndford family]."

"1597, the 15th of March, the single combat foughten betwixt Adam Bruntfield and James Carmichael; the said Adam challenged James Carmichael for murdering of his umle^d brothir Stephin Bruntfield, captain of Tantallon. The said Adam purchased a licence of his majesty, and fought the said James in Barnbogle Links before about five thousand gentlemen; and the said Adam, although but ane young man, and of mean stature, slew the said James Carmichael, he being as able a lyke man as was living."

(From *Anderson's History of Scotland*, MS. Adv. Lib.)

"Thai met in ane small inche by the sea, near to Barnbogle, my lord duke and sundry othere being their judges." The same work proceeds to state, that Carmichael first struck Bruntfield in "the lisk" (loin), which was returned with a stroke that felled Carmichael to the earth; Bruntfield then leapt upon the body of his adversary, and dispatched him with his dagger. He was then conducted back to the city with acclamations.

(From *Notes of a conversation on Local Antiquities*, with Sir Walter Scott, December 17, 1824.)

"We spoke of Bruntfield Links, an extensive downs in the neighbourhood of Edinburgh. Sir Walter said, that, in his young days, there was a stone near the upper end of that common, which was pointed out as the scene of a remarkable murder which took place at the end of the sixteenth century. The name of the murderer was Carmichael—of the slain man Bruntfield; and from this latter individual the common was said to have derived its name. According to tradition, the widow of Bruntfield had three sons, all of whom she brought up with the duty of revenging their father's death inculcated upon them, and with the view that each, as he successively reached the years of manhood, should challenge and fight Carmichael. Two did this, and met with their father's fate; but the youngest obtained leave from the king to fight Carmichael in public lists on the island of Cramond, where a vast assemblage of people, from every part of Scotland, met to witness the combat. Carmichael, though a tall and powerful man, compared with his opponent, was killed on the spot."

For notices of the Moubrays of Barnbogle, an honourable family now extinct, see Mr Pitcairn's excellent publication of "Criminal Trials."

THE BEGGAR'S DISH.

BURNS, in his "Jolly Beggars," likens a lady's mouth, rather irreverently, to an "awmos dish;" and perhaps few readers of the poems of that immortal bard are aware of what he means by the expression. The "awmos dish," or "beggar's dish," as it was more frequently called, was a wooden vessel, half platter, half bowl, with which every mendicant was formerly provided, as a regular and proper part of his professional accoutrements. All things are now changed—even the business of begging. The good honest mendicant of the days of our grandfathers, with his "remembered face," is no more; he has given way to a wretched demoralised race, the scum of large towns, the outcasts of nests of profligates, who are a disgrace to the formerly half-respected name of beggar. The awmos dish was a piece of furniture attached to the profession from a very early period. In the time of our Queen Mary, when the Protestants of the Netherlands first began to resist the tyranny of Philip II., the Count de Berlaumont contemptuously told the Princess of Parma, that she had nothing to fear from such a race of beggars—using the French word *gueux*. The Protestants seized upon and rejoiced in the title—*Les Gueux*! At a great dinner, held for the purpose of expressing their sentiments, the Marquis of Utrecht, who acted as president, descended from the chair, and, reappearing with a beggar's wallet upon his back, and a beggar's wooden cup in his hand, drank the general health in that vessel, which was immediately passed round the company, all of whom did the same. When these patriots afterwards, by a strange enthusiasm, assumed the garb of beggars, the wooden dish was part of the *properties*—to use the theatrical phrase—with which they supported the character. The vessel, which thus flourished in the sixteenth century, was generally used by the Scottish mendicants and tinklers till near the close of the eighteenth, when

the old honest system of mendicancy itself came to a close. Perhaps, if it were for nothing but its connection with one of the most heart-stirring tales of modern liberty, this object would deserve commemoration. Some attention, also, is due to it on account of its being the subject of simile of Burns. I shall therefore make no apology for presenting my readers with the following curious account of it, from the pen of a Peeblesshire shepherd, who is old enough to remember its general use. I print the article in the exact phraseology used by my correspondent:—

"The beggar's dish was used by two sets of persons—the itinerant and professed beggars, and the wandering tribes of gipsies. There was no difference in the shape and size of either; but the latter class had theirs often clasped with strong hooks here and there, or perhaps bound round the middle with a neat yellow hoop. As far as I can recollect, it varied in size from a pint and a half to two Scots pints of measure; but in my father's house at Etrick Hall, I remember one that would have holden, I think, between three and four pints, and it generally went by the appellation of "the beggar's dish." I never saw any other plates of their shape or form; they increased gradually in width from the bottom to the middle, and for about two inches more contracted hastily towards the brim, the edge of which was turned very thin, so thin that they often had rents in several places of their upper edge, and these cracks the tinklers held together with clear or yellow tin, or wire hooks, as noticed above. The beggar's dish was used for two purposes, to receive their *awmos*, and to carry broth, milk, porridge, &c. out to the road-side, where the men and beggar's children staid till the return of the wives from the farm-house, with what beverage they could collect either by entreaty or pilfry; and for carrying victuals the beggar's dish was well adapted, for, by its contracting so near the brim, it prevented from spilling what the good housewife had poured into it, and also kept the food warm and comfortable till it reached the principal horde: this case, however, was only applicable to the tinklers. The professional beggar presented himself and his wants all at once. I think I see him, as I have often done, leaning over a long pike stave, as it was called, and saying, 'Gudewife, I maun hae my awmos;' 'What d'ye take?' was then asked. In a hoarse, slow tone, it was then answered, 'Meal, or ony thing ye like.' The meal *rushy* was then sought, when the beggar from below his left arm drew out his beggar's dish, held it out, and into it the gudewife put half a dozen or half a score handfuls of meal; but the quantity was adjusted as the beggar stood high or low in the gudewife's esteem—as he was of good or bad report—as he was known or was a stranger in the place—or as he was known to have much or little need. He then poured it into a small sack, or meal pock, as it was called, which was slung over his right shoulder, and hung on his left side, below his left arm, and in above it thrust his dish, unless the gudewife gave him also *kale* or milk; this was also poured into his dish; then if there were many servants, &c. in the house at the time, the beggar generally went to the door, or went out where he could get a seat till he had eaten up his awmos; when this was done, and his pocks all equally balanced about him, he returned to the kitchen, thanked the gudewife for her kindness, wished all the family well, with peace and plenty among them; then leaning on a long white sturdy kent, well shod with iron on the foot, and which grated among the stones aye as he set it down, slowly retired from the hospitable door. The meal pock was made of sarken cloth, and had always a mealy appearance. The rest which hung about him were woollen, and in many cases were patched up with different pieces almost from all kinds of cloth: in these he carried bread, cheese, flesh, &c. or whatever he could not consume at a time; and it was afterwards good cheer, as he travelled over extensive wilds, or from one glen head to another.

"The meal pock, when well filled, I think, would have holden two stones of meal, and, as ye observe, was made up of all the different meals in the parish, or rather of a whole county. I know not by what appellation it was known among the beggars; but the country people called it *awmos meal*. Whenever they fell in with any that would buy of it, they never missed to sell some, though it had been but a pound at a time; and it was generally bought by the poorer sort of the people. I never noticed the real beggar seek his dish from any other place but his meal pock; but the tinkler wives wore one or two of their upper coats tucked up in the tails around their waist, yet hanging loose about, and this formed a large lap all around them, and out of this they invariably drew their beggar's dish. But in many parts of Scotland the beggar and his dish have altogether disappeared. I hope this is an indication of a national increase in riches and opulence in general, and of the prosperity and independence of the meanest class of the nation's inhabitants; but in days of yore, the well-known beggar, after he had travelled his annual round, was always a welcome guest at the farm-house; modestly, and yet with assurance, he took his seat at the ingle side, and talked—how powerfully he'd talk!—of cold and fertile soils and seasons, of backward springs, late har'sts, and winds and storms, and drifts, and floods, and frosts; and where he was, and how employed, the time they lasted. Next he'd talk of Tweed and all its feeders, as he ca'd them, which swell its current, and augment its stream; name all its haughs and holms, from Tweedhope Head to Berwick Law,

and every tenant's name who farms each fertile spot; and even at the yearly rent he'd guess, so informing and intelligent a person was the beggar.

"In the beggar's rounds now circling a set of young sturdy fellows, of a timorous yet menacing look. They have neither dish nor spoon, and several I have seen have not a shirt on their back. They are often seen in pairs; but how they subsist, or what means use to procure a livelihood, are alike unknown. Instead of the beggar with his honest front and plump rosy face, you now meet a little smart fellow, with a ragged coat, torn shoes, and his face much daubed with filth. He will generally, and with considerable sharpness, ask the time of the day, or the name of a farmstead in view, also the farmer's name, and that is all ye will know about him; he passes you, and the next traveller he meets, as he goes by he puts the same questions; but if ye had accosted the ancient beggar, he directly told (at least, at the smallest hint being given him) he told you of the state of labour through all the districts he had passed, of the forwardness or lateness of the braird, har'st, &c.; so that the beggar of former years was like a farmer's magazine to the country; and every new improvement of the soil or new implement of agriculture was described by him with wonderful precision and exactness."

LORD BROUGHAM.

"BROUGHAM," says Hazlitt, in one of his best papers on "the Spirit of the Age," and in his usual discriminating manner, was born and educated in Edinburgh, and represents that school of politics and political economy in the House.* [This was written before his lordship's accession to the peerage.] He differs from Sir James Mackintosh in this, that he deals less in abstract principles, and more in individual details. He makes less use of general topics, and more of immediate facts. Sir James is better acquainted with the balance of arguments in old authors—Brougham with the balance of power in Europe. If the first is better versed in the progress of history, no man excels the latter in a knowledge of the course of exchange. He is apprised of the exact state of our exports and imports, and scarce a ship clears out its cargo at Liverpool or Hull but he has notice of the lading. Our colonial policy—prison discipline—the state of the hulks—agricultural distress—commerce and manufactures—the bullion question—the Catholic question—the Bourbons or the Inquisition—domestic treason—foreign levy—nothing can come amiss to him. He is at home in the crooked mazes of rotten boroughs; is not baffled by Scotch law; and can follow the meaning of one of Mr Canning's speeches. With so many resources—with such variety and solidity of information—Brougham is rather a powerful and alarming, than an effectual debater. In so many details (which he himself goes through with unwearied and unshrinking resolution), the spirit of the question is lost to others who have not the same voluntary power of attention, or the same interest in hearing, that he has in speaking; the original impulse that urged him forward is forgotten in so wide a field—in so interminable a career. He keeps a ledger, or a debtor and creditor account between the government and the country, posts so much actual crime, corruption, and injustice, against so much contingent advantage or sluggish prejudice, and at the bottom of the page brings in the balance of indignation and contempt where it is due. But people are not to be *calculated into* contempt and indignation on abstract grounds; for, however they may submit to this process where their own interests are concerned, in what regards the public good we believe they must see and feel instinctively, or not at all. There is, it is to be lamented, a good deal of froth as well as strength in the popular spirits, which will not admit of being *decanted*, or served out in formal dribbles; nor will spleen, the soul of opposition, bear to be corked up in square patent bottles, and kept for future use—in a word, Brougham is ticketed and labelled eloquence, registered, and *in numeris*, like the successive parts of a Scotch encyclo-

* The birth and existence of this illustrious orator depended upon a chance circumstance, which will strike every one with wonder. His lordship's father, it is well known, was proprietor of Brougham Hall, and a fine estate in the north of England, which still form the patrimony of the family. He was about to be married to a lady in his own neighbourhood, to whom he was passionately attached, and every preparation had been made for their nuptials, when, to Mr Brougham's great grief, his mistress sickened and died. To beguile himself of his sorrows, he determined on travelling, and came to Edinburgh, where, wandering about on the Castlehill—then a fashionable lounge, but now completely laid waste by "improvements," and deserted—viewing the city, he happened to inquire of a fellow-idler where he could find respectable and convenient lodgings. By this person he was directed—not to the New Town, or to any of the hotels, for at that time no such thing existed in the Scottish capital—but to Mrs Syme, sister of Principal Robertson the historian, widow of the Rev. Mr Syme, minister of Auloe, who then kept the largest and most genteel board and lodging establishment in town, in the second flat of M'Leilan's land (this Edinburgh phrase signifies a house from top to bottom), head of the Cowgate (marked No. 8), the front windows of which look straight up the Candlemaker Row, a tenement which, it may be remarked, forms the north wing of that quiet connecting the Cowgate with the Grassmarket, through which Reuben Syme made his escape from the rioters, and the execution of Captain Porteous, as detailed in the tale of the Heart of Mid-Lothian. Here Mr Brougham forthwith proceeded to settle himself; and though he did not at first contemplate a permanent residence in this city, he soon found occasion to make that resolution; for, falling in love with Miss Syme, who was a young lady of great merit and beauty, he abandoned his early sorrows, and, espousing her, lived all the rest of his life in Edinburgh. He resided, for some time after his marriage in Mrs Syme's house; subsequently, he removed to St Andrew's Square in the New Town, then only commencing, and there, in a flat of that substantial corner edifice, having North St David Street on the west, and the square on the south, was Henry Brougham born.

pædia: it is clever, knowing, imposing, masterly—an extraordinary display of clearness of head, of quickness and energy of thought, of application and industry—but it is not the eloquence of the imagination of the heart, and will never save a nation or an individual from perdition. Brougham has one considerable advantage in a debate—he is overcome by no false modesty, no deference to others. But then, by a natural consequence or parity of reasoning, he has little sympathy with other people, and is liable to be mistaken in the effect his arguments will have upon them. His perceptions are literal, tenacious, *epileptic*; his understanding voracious of facts, and equally communicative of them, and he proceeds to

—pour out all as plain
As downright Shippin, or as old Montaigne,

without either the virulence of the one or the *bonhomie* of the other. The repeated, smart, unforeseen discharges of the truth, jar those that are next him. He is too improvident for a leader, too petulant for a partisan, and does not sufficiently consult those with whom he is supposed to act in concert. He sometimes leaves them in the lurch, and is sometimes left in the lurch by them. He wants the principle of co-operation. He frequently, in a fit of thoughtless levity, gives an unexpected turn to the political machine, which alarms older and more experienced heads; if he was not himself the first to get out of harm's way, and escape from the danger, it would be well. We hold, indeed, as a general rule, that no man born or bred in Scotland can be a great orator, unless he is a mere quack—or a great statesman, unless he turns plain knave. The national gravity is against the first—the national caution against the last. To a Scotchman, if a thing is, it is; there is an end of the question, with his opinion about it. He is positive and abrupt, and is not in the habit of conciliating the feelings or soothing the fallacies of others. His only way, therefore, to produce a popular effect, is to sail with the stream of prejudice, and to vent common dogmas. On the other hand, if a Scotchman, born or bred, comes to think at all of the feelings of others, it is not as they regard them, but as their opinion re-acts on his own interest and safety. He is therefore either pragmatical and offensive, or, if he tries to please, he becomes cowardly and fawning. His public spirit wants pliancy. He is as impracticable as a popular partisan, as he is mischievous as a tool of government.

Brougham speaks in a loud and unmitigated tone of voice, sometimes almost approaching to a scream. He is fluent, rapid, vehement, full of his subject, with evidently a great deal to say, and very regardless of the manner of saying it. Brougham writes almost as well as he speaks. In the midst of an election contest, he comes out to address the populace, and goes back to his study to finish an article for the *Edinburgh Review*; sometimes, indeed, wedging three or four articles into a single number. Such is the activity of his mind, that it appears to require neither repose, nor any other stimulus than a delight in its own exercise. He can turn his hand to any thing, but he cannot be idle. There are few intellectual accomplishments which he does not possess, and that in a very high degree. He speaks French, and we believe several other modern languages, fluently; is a capital mathematician, and obtained an introduction to the celebrated Carnot in the latter character, when the conversation turned on squaring the circle, and not on the propriety of confining France within the natural boundaries of the Rhine. This individual is in fact a striking instance of the versatility and strength of the human mind, and also in one sense of the length of human life, if we make a good use of our time. [How true is the following remark!] There is room enough in human life to crowd almost every art and science into it. If we pass "no day without a line," visit no place without the company of a book, we may with ease fill libraries, or empty them of their contents. Those who complain of the shortness of life, let it slide by them without wishing to seize and make the most of its golden minutes. The more we do, the more we can do; the more busy we are, the more leisure we have. If any one possesses any advantage in a considerable degree, he may make himself master of nearly as many more as he pleases, by employing his spare time, and cultivating the waste faculties of the mind. While one person is determining on the choice of a profession or study, another shall have made a fortune, or gained a merited reputation. While one person is dreaming over the meaning of a word, another will have learned several languages. It is not incapacity, but indolence and indecision that afflict us. While we are walking backward and forward between Charing Cross and Temple Bar, and sitting in the same coffeehouse every day, we might make the grand tour of Europe, and visit the Vatican and the Louvre.—[The distinguished statesman who has been the subject of the present sketch, has avoided this indolence of character, and is now reaping the reward of his toils and the cultivation of his genius. Among other means of enlarging his views, he has visited, we believe, most of the courts, and turned his attention to most of the constitutions, of the Continent.]

A NIGHT SCENE ON THE NIGER.

THE *Literary Gazette* of February the 18th, has favoured us with the following interesting extract from the forthcoming work of the two brothers Landers, whose discovery of the estuary of the Niger has dis-

tinguished them among a crowd of intrepid African travellers:—

"We made no stop whatever on the river, not even at meal times, our men suffering the canoe to glide down the stream while they were eating their food. At five in the afternoon, they all complained of fatigue, and we looked around us for a landing-place, where we might rest a while, but we could find none; for every village which we saw after that hour was unfortunately situated behind large thick morasses and sloughy bogs, through which, after various provoking and tedious toils we found it impossible to penetrate. We were employed three hours in the afternoon in endeavouring to find a landing at some village; and though we saw them distinctly enough from the water, we could not find a passage through the morasses behind which they lay. Therefore we were compelled to relinquish the attempt, and continue our course on the Niger. We passed several beautiful islands in the course of the day, all cultivated and inhabited, but low and flat. The width of the river seemed to vary considerably; sometimes it seemed to be two or three miles across, and at others double that width. The current drifted us along very rapidly, and we guessed it to be running at the rate of three or four miles an hour. The direction of the stream continued nearly east. The day had been excessively warm, and the sun set in beauty and grandeur, shooting forth rays tinged with the most heavenly hues, which extended to the zenith. Nevertheless, the appearance of the firmament, all glorious as it was, betokened a coming storm; the wind whistled through the tall rushes, and darkness soon covered the earth like a veil. This rendered us more anxious than ever to land somewhere—we cared not where—and to endeavour to procure shelter for the night, if not in a village, at least under a tree. Accordingly, rallying the drooping spirits of our men, we encouraged them to renew their exertions by setting them the example, and our canoe darted silently and swiftly down the current. We were enabled to steer her rightly by the vividness of the lightning, which flashed across the water continually; and by this means also we could distinguish any danger before us, and avoid the numerous small islands with which the river is interspersed, and which otherwise might have embarrassed us very seriously. But though we could perceive almost close to us several lamps burning in comfortable looking huts, and could plainly distinguish the voices of their occupants, and though we exerted all our strength to get at them, we were foiled in every attempt, by reason of the sloughs and fens, and we were at last obliged to abandon them in despair. Some of these lights, after leading us a long way, eluded our search, and vanished from our sight like an *ignis fatuus*; and others danced about, we knew not how. But what was more vexatious than all—after we had got into an inlet, and toiled and tugged for a full half hour against the current, which in this little channel was uncommonly rapid, to approach a village from which we thought it flowed, both village and lights seemed to sink into the earth, and the sounds of the people's voices ceased of a sudden; and when we fancied we were actually close to the spot, we strained our eyes in vain to see a single hut—all was gloomy, dismal, cheerless, and solitary. It seemed the work of enchantment; every thing was as visionary as 'sceptres grasped in sleep.' We had paddled along the banks a distance of not less than thirty miles, every inch of which we had attentively examined, but not a bit of dry land could any where be discovered, which was firm enough to bear our weight. Therefore, we resigned ourselves to circumstances, and all of us having been refreshed with a little cold rice and honey, and water from the stream, we permitted the canoe to drift down with the current, for our men were too much fatigued with the labours of the day to work any longer. But here a fresh evil arose, which we were unprepared to meet. An incredible number of hippopotami arose very near us, and came splashing, snorting, and plunging all round the canoe, and placed us in imminent danger. Thinking to frighten them off, we fired a shot or two at them; but the noise only called up from the water, and out of the fens, about as many more of their unwieldy companions, and we were more closely beset than before. Our people, who had never in all their lives been exposed in a canoe to such huge and formidable beasts, trembled with fear and apprehension, and absolutely wept aloud; and their terror was not a little increased by the dreadful peals of thunder which rattled over their heads, and by the awful darkness which prevailed, broken at intervals by flashes of lightning, whose powerful glare was truly awful. Our people tell us that these formidable animals frequently upset canoes in the river, when every one in them is sure to perish. These came so close to us, that we could reach them with the butt-end of a gun. When I fired at the first, which I must have hit, every one of them came to the surface of the water, and pursued us so fast over to the north bank, that it was with the greatest difficulty imaginable we could keep before them. Having fired a second time, the report of my gun was followed by a loud roaring noise, and we seemed to increase our distance from them. There were two Bornou men among our crew, who were not so frightened as the rest, having seen some of these creatures before on Lake Tchad, where, they say, there are plenty of them. However, the terrible hippopotami did us no kind of mischief whatever; they were only sporting and wallowing in the river for their own amusement, no doubt, at first,

when we interrupted them; but had they upset our canoe, we should have paid dearly for it. We observed a bank on the north side of the river shortly after this, and I proposed halting on it for the night, for I wished much to put my foot on firm land again. This, however, not one of the crew would consent to, saying, that if the Gewo Roua, or water elephant, did not kill them, the crocodiles certainly would do so before the morning; and I thought afterwards that we might have been carried off, like the Cumbrie people on the islands near Yaourie, if we had tried the experiment. Our canoe was only large enough to hold us all when sitting, so that we had no chance of lying down. Had we been able to muster up thirty thousand cowries at Rabba, we might have purchased one which would have carried us all very comfortably. A canoe of this sort would have served us for living in entirely; we should have had no occasion to land, except to obtain our provisions; and, having performed our day's journey, might have anchored fearlessly at night. Finding we could not induce our people to land, we agreed to continue on all night. The eastern horizon became very dark, and the lightning more and more vivid; indeed, I never recollect having seen such strong forked lightning before in my life. All this denoted the approach of a storm. At eleven p. m. it blew somewhat stronger than a gale, and at midnight the storm was at its height. The wind was so strong, the sea washed over the sides of the canoe several times, so that she was in danger of filling. Driven about by the wind, our frail little bark became unmanageable; but, at length, we got near a bank, which in some measure protected us, and we were fortunate enough to lay hold of a thorny tree, against which we were driven, and which was growing nearly in the centre of the stream. Presently we fastened the canoe to its branches, and, wrapping our cloaks round our persons, for we felt overpowered with fatigue, and with our legs projecting half over the sides of the little vessel, which, for want of room, we were compelled to do, we lay down to sleep. There is something, I believe, in the nature of a tempest which is favourable to slumber, at least so thought my brother; for though the thunder continued to roar, and the wind to blow—though the rain beat in our faces, and our canoe lay rocking like a cradle—still he slept soundly. The wind kept blowing hard from the eastward, till midnight, when it became calm. The rain then descended in torrents, accompanied by thunder and lightning of the most awful description. We lay in our canoe, drenched with water, and our little vessel was filling so fast, that two people were obliged to be constantly baling out the water, to keep her afloat. The water elephants, as the natives term the hippopotami, frequently came snorting near us, but, fortunately, did not touch our canoe. The storm continued until three in the morning of the 17th, when it became clear, and we saw the stars sparkling like gems over our heads."

EMIGRATION.

"I LEFT York," continues Mr Fergusson, "on Wednesday, May 11, in the stage, for Hamilton, at the head of Burlington Bay, it being my intention to stop at night, and diverge next day into the woods. The roads were yet unprepared for the season, and we travelled in an open waggon, the day fine, and, for the first time, somewhat sultry. It was interesting to observe the sudden transition from the streets of York to the solemn stillness of the forest; as, I think, we could not have proceeded above two or three miles, ere we were immersed in all the wild magnificence of a cedar swamp, and hemmed in by towering pines and hemlocks on every side. A cedar swamp forms an exception to a general rule, as it enjoys pure water, and secures health to its inhabitants, which is also the case where the hemlock, fir, and spruce abound. The land in such situations is not of the richest quality, sometimes sandy and poor; and the absence of fever and ague would seem to be granted, in compensation for diminished returns.

Our route lay through Toronto district; and I had the gratification of observing cultivation in every stage of its progress. There was the rude *shanty*, or log-hut, its owner wielding the axe against the stately vegetable columns around him, or employed in reducing them to ashes, while some were left standing, to blacken with the flames, or doomed to a protracted fate, under the operation of *girdling*, by which the bark is cut round the stem, and life destroyed. A little farther on we passed an older farm—the mansion and offices commodious and neat, rich orchards, loaded with blossom, fine wheat, and pasture and meadow land, healthy-looking children at every door, with pigs and poultry in abundance. As we passed each farmer's open door, we saw groups of old and young seated at their evening meal, neat, clean, and comfortably clad. In general, Canadians and Americans are deficient in what we call *dressing up their doors*; they are in fact so much engaged in heavier and more important work, that the period for training roses and honeysuckles has not yet arrived. We passed, however, one small property this evening, belonging to a Mr Adams, and laid out as a nursery (smile not at a nursery in America), filled with peach, apple, and pear trees, flowering shrubs, &c., and which, by its neat arrangement and excellent order, forms at once a contrast and an example to its neighbours. We encountered some very steep hills and some hazardous

roads, especially ascending and descending the banks of two considerable creeks or rivers, falling into Ontario. Large sums have been expended in levelling, &c., apparently with but indifferent judgment or success. I reached Summer's Tavern, thirty-five miles from York, about eight, and found a most obliging host, with comfortable accommodation."

Next day, Mr Fergusson visited the city of Guelph. "The road thither," he continues, "is through the finest forest scenery I had yet seen, and clearings were going forward in various places, and in every state of progress. I could not but admire the luxuriance and healthy appearance of the wheat and clover. The whole tract is upon limestone, and in some places the road passes over ridges of it absolutely inexhaustible. The cattle and pigs are but very indifferent. The state of the road may be in some measure estimated, from a party which I passed, consisting of three men and six oxen, that had been three days absent from home, which they would only reach that day, drawing a load under which a donkey would have trotted upon any British turnpike; and the whole extent of the journey not exceeding twenty miles. Guelph is situated in the Gore district, about eighty miles from York, and has been laid out upon an extensive scale. A fine stream flows past the town, and a large grist-mill is at work upon it. A good deal of land has been located in the neighbourhood, and the town may ultimately prosper. At present it wears a stagnant appearance, and conveys somewhat the idea of the cart preceding the horse. When farms become numerous, and a mill is erected in a convenient situation, a town soon grows up; but here the town has been hurried forward, in the hope of settling the land. A vast deal of capital has been expended on roads, &c., which must have so far benefited labourers, and tended in some measure to enable them to purchase lots; but at present a very desolate complexion marks Guelph as a city which may be very thankful to maintain its ground, and escape desertion. The price of company land is here about 15s. per acre, of good quality; and, I believe, from the unsteady character of some of the early settlers, good purchases of farms partially cleared are frequently to be had. Guelph stands upon a fine natural platform, with the river flowing round it. A good bridge was nearly finished when I was there, and an extensive line of road is intended to connect this with the Huron settlement at Goderich.

I spent the evening in company with Mr Prior, the acting manager, who has many arduous duties to perform. We conversed, of course, much upon the subject of emigration. His opinion coincides with the general conviction, that no steady industrious man can fail to prosper in Canada, according to his means. The commissioners are now greatly more circumspect in the character of settlers than was the case at first; and it is a leading object to obtain sober, moral, correct men, that a good neighbourhood may be every where secured.

In disposing of lots to settlers, two methods are adopted in Canada, and their respective advantages and disadvantages are warmly discussed. The one adopted by the Canada Company is to *insist* upon an instalment at entry. The other method is to leave payment of any portion optional to the settler, but carrying on an account of interest against him. The advocates of the first plan maintain, that, by paying down a certain sum at first, the settler feels an interest and a degree of independence which he would not otherwise experience, and that the sums advanced enable the landlord to make roads, erect bridges, mills, &c.; and farther, that as the black account is always running on, and a day of settling must arrive, for which the settlers are too often forgetful to provide, it ends in the abandonment of the farm, and in ruin to themselves and families. For the second plan, it is argued that many industrious worthy men have absolutely no capital to begin with, beyond what may be necessary to purchase oxen, ploughs, &c., and to maintain their families until a crop is gathered, and that to exact their pittance in such circumstances, is in fact to stifle their industry in its birth. By allowing time, and regularly balancing the account, taking occasionally what may be forthcoming either in cash, cattle, or grain, a poor man slips into clear possession without feeling any inconvenience. We shall find, that, as in most questions of the kind there is much to be said on both sides, and probably either plan may be followed with advantage in certain particular cases."—*Agricultural Journal*.—To be continued.

STEEL PLATES FOR ENGRAVING.

For several years past, sheet steel has been used in large quantities, instead of copperplates, by the engravers. By this fortunate application of so durable, and it may be added so economical a material, not only has a new field been discovered admirably suited to yield in perfection the richest and finest graphic productions which the ingenuity of modern art can accomplish, but to do so through an amazingly numerous series of impressions without perceptible deterioration. The art of engraving on iron or steel for purposes of ornament, and even for printing, in certain cases, is by no means a discovery of modern times; but the substitution of the latter material for copper, which has invited the superiority of the British burin to achievements hitherto unattempted by our artists, is entirely a modern practice.

In the year 1810, Mr Dyer, an American merchant residing in London, obtained a patent for certain improvements in the construction and method of using plates, and presses, &c., the principles of which were communicated to him by a foreigner residing abroad. This foreigner was Mr Jacob Perkins, an ingenious artist of New England, and whose name subsequently became so extensively known in this country, in connection with roller-press printing from hardened steel plates. The plates used by Mr Perkins were, on the average, about five-eighths of an inch thick; they were either of steel, so tempered as to admit of the operation of the engraver, or, as was more generally the case, of steel decarbonated, so as to become very pure soft iron, in which case, after they had received the work on the surface, they were case-hardened by cementation.

The decarbonating process was performed by enclosing the plate of cast steel, properly shaped, in a cast iron box or case filled about the plate to the thickness of about an inch, with oxide of iron or rusty iron filings. In this state the box is luted close, and placed on a regular fire, where it is kept at a red heat during from three to twelve days. Generally about nine days is sufficient to decarbonise a plate five eighths of an inch in thickness. When the engraving or etching has been executed, the plate is superficially converted into steel by placing it on a box as before, and surrounding it on all sides by a powder made of equal parts of burned bones and the cinders of burned animal matter, such as old shoes or leather. In this state the box, with its contents, closely luted, must be exposed to a blood-red heat for three hours; after which it is taken out of the fire, and plunged perpendicularly edgewise into cold water, which has been previously boiled, to throw off the air. By this means the plate becomes hardened, without the danger of warping or cracking. It is then tempered, or let down, by brightening the under surface of the plate with a bit of stone; after which it is heated by being placed upon a piece of hot iron, or melted lead, until the rubbed portion acquire a pale straw colour. For this purpose, however, the patentee expressed himself in favour of a bath of oil heated to the temperature of 460 degrees, or thereabouts, of Fahrenheit's scale. The plate being cooled in water, and polished on the surface, was ready for use.

A more material peculiarity in Mr Perkins's invention, and one which does not seem to have been approached by any preceding artist, was the contrivance of what are called *indenting cylinders*. These are rollers of two or three inches in diameter, and made of steel, decarbonised by the process before described, so as to be very soft. In this state they are made to roll backward and forward under a powerful pressure, over the surface of one of the hardened plates until all the figures, letters, or indentations, are communicated with exquisite precision, in sharp relief, upon the cylinder, which being carefully hardened and tempered, becomes by this means fitted to communicate an impression to other plates, by an operation similar to that by which it was originally figured. —*Lardner's Cyclopædia*.

THE CHOLERA—MUSSELBURGH.

Mr D. M. MOIR, surgeon, Musselburgh, well known in the world of *belles lettres*, by his poetic contributions, under the signature of Delta, to Blackwood's Magazine, and to the world of physic, by his recent History of Ancient Medicine, has found time, amidst the multitude of his professional duties, to throw together a few "Practical Observations on Malignant Cholera, as that Disease is now exhibiting itself in Scotland." In these observations, the author is the unflinching advocate of the doctrine that cholera is *virulently contagious*, and in no case appears unless where there has been a communication or near contact with the affected. "In the malignant cholera," says he, "no sooner does a case show itself in any particular street or district, than, if entire isolation be not immediately effected, a second and a third follow, and at length the whole neighbourhood is subjected to its influence. Not a single case has occurred where communication with the infected could not be readily traced out; while, on the contrary, where intercourse has been completely cut off, the progress of the disease has been to a certainty arrested. Of the contagious nature of cholera, at least in this climate, I am as thoroughly convinced as of my own existence." Again—"It is quite a mistake to suppose that the disease is either so erratic or whimsical in its wanderings from district to district, as some would lead us to suppose, or that it will suddenly disappear, after having wreaked a desultory violence. This idea is founded on the erroneous supposition of its non-contagious nature, and a number of apparent illustrations have been brought forward in its support. The fact is, that cholera will nowhere abate or pass away while a victim susceptible of its influence remains, provided such be exposed to its contagion; and no doctrine more dangerous or destructive to the safety of society can be promulgated. Until all are made aware of the risk to which they are exposed, adopt every means of prevention, and keep beyond the pale of contagion, the disease will propagate itself, and appear and re-appear with renewed force. The necessity is therefore urgent for continuing every preventive restriction and regulation in full force; to isolate every case that can be managed; and to render the concentration of the pestilential forces

less virulent, by feeding and clothing the poor, as well as attending to the purification and cleanliness of their dwellings." While partly agreeing with Mr Moir that cholera is contagious, it does not seem necessary to believe that such a circumstance should in any way disprove the apparently erratic character of the disease, which may probably be conveyed by a letter, by the transportation of the most minute substance, from an infected to a non-infected district (physicians who have written on cholera seem to avoid mentioning the possibilities of the contagion being carried with goods); but it is equally obvious that, after all, it is taken only by those whose temperament or state of body predisposes them for receiving it.

If a predisposition in individuals be generally necessary for the reception of cholera, it would appear that some towns are more liable to its visitation than others. Musselburgh stands at the distance of five miles east from Edinburgh, on a flat, sandy site, at the mouth of the Esk, on its right bank, while Fisherrow lies on the left, both very little above the level of the sea. The Esk, though a small stream, covers a wide gravelly channel, and is crossed by an ancient and modern stone bridge, and two wooden bridges. The town is intersected by a mill-lead from the river, which is partly covered in. The High Street, which runs from west to east, is spacious, and the houses throughout the town are generally well built. In the outskirts are many isolated houses in the villa style. There are a number of lanes and mean thoroughfares, which have not hitherto been kept in the cleanest manner. Fisherrow is much inferior in appearance to Musselburgh, and presents an excellent field for cholera. It consists of a main and back street, with a number of narrow closes; and the fact is undeniable, that it has hitherto been one of the dirtiest towns in Scotland. The lower classes of both places, as in most of the towns of Mid-Lothian, have also been of intemperate habits, which are well known to be excellent preparatives for cholera.

A ROMAN CITY—POMPEII.

In describing a Roman city, our attention is first drawn to the Forum, the focus of business, the resort of pleasure, the scene of all political and legal contention. In the early ages of Rome, one open space probably served for all the public meetings of the people, whether for the purposes of traffic, for the administration of justice, or for meetings to deliberate upon public affairs. So in Greek, the same word, *agora*—derived from *agerio*, I collect—signifies equally a market, a place of assembly for citizens, and the assembly itself. As wealth and splendour increased, and business became more complicated, it was found to be inconvenient to have so many different occupations carried on together, and two classes of *fora* arose—*Venalia*, mere markets, as the Forum Bonarium, or ox market, Piscarium, fish market, &c.; and *Civilia*, those devoted to the other purposes of a place of assembly, of which, however, until the time of Julius Cæsar, there was but one. He built a second of extraordinary splendour, the area alone of which cost the enormous sum of £800,000, from which we may imagine the expense and splendour of the superstructure; and others were afterwards constructed by the emperors. For the country, however—at all events in small places like Pompeii—a single Forum continued to be sufficient. Some difference existed between the Greek and Roman *fora*, derived from the difference of the uses to which they were to be applied. The Greek were built square, with columns near each other, to give as much shelter as possible. On these was placed a marble architrave, supporting an upper ambulatory, or gallery for walking. This gallery the Romans retained (there appears to have been one at Pompeii); but the area, instead of being square, was oblong, and the pillars set at considerable intervals. These variations seem to have been made to give the greatest possible convenience for viewing shows of gladiators, which, previous to the building of amphitheatres, were exhibited in the Forum. In its simple state, it was merely an open area, surrounded by a colonnade, a sort of exchange; but in the period of Roman splendour, it was usually encompassed by a series of splendid public buildings, on which all the riches of architecture were lavished. Basilicæ, or courts of justice; Curia, or places of assembly for the senate or local magistracy; Tabulæria, where the public records were kept; temples, prisons, public granaries, all things necessary for the public pleasure or convenience, were here collected in immediate neighbourhood to each other. Various trades were exercised under the porticoes; the money-changers had their stalls below; the management of the public revenue was usually carried on in the gallery above. At one end, or in an adjoining basilica, the prætor usually administered justice; within were the rostra from which orators addressed the people. The liveliness and tumult of the scene, where all these employments were carried on, may well be imagined.

We now proceed to describe the Forum of Pompeii. Entering at the gate of Herculaneum, the main street of the town leads the visitor to the north-west corner. Here he gains admittance by a flight of steps leading downwards through an arch in a brick wall, still partially retaining the stucco by which it was covered. Remains of iron gates were found at several of the entrances, from whence it is inferred that they were closed at night. There is a smaller passage to the

right of the arch just mentioned, and between them a public fountain, attached to the wall. Upon entering, the spectator finds himself in a large area surrounded by columns and the ruins of temples, triumphal arches, and other public buildings, the particular uses of which can in general only be conjectured. The red masses of brick, divested of their marble casings, the brown and yellow tints of the tufa, the fragments of white stucco attached to the shattered walls of the different edifices, and the pedestals which once supported statues commemorating those who had deserved well of their country, are all that now remain to attest its former beauty and magnificence. Around the west, south, and east sides, there runs a Grecian Doric colonnade, uninterrupted, except on the east, where the porticoes of the surrounding buildings in some instances come flush up to the colonnade, and in some places break the line of the upper gallery, preserving an interrupted communication below. Where this was the case, stairs ran up to the gallery; but probably there was also some communication between these several divisions of it, without descending to the ground. True it is, that as no vestige of this upper story remains, it may seem rash to assert its existence so boldly; but the traces of staircases, combined with the authority of Vitruvius, are sufficient to warrant us in doing so. Probably it was built of wood; this would account for its total disappearance. The diameter of the columns was two feet three and a half inches, their height twelve feet, the interval between them six feet ten inches. On the eastern side, there still remains a portion of an older arcade, which the inhabitants, at the time of the eruption, were in the course of replacing by the Doric portico. The pillars are of three materials—of fine white caserto stone, resembling marble; of ancient yellowish tufa; and of brick plastered. The wall by which we have entered is connected with the back of the building called by some the Temple of Jupiter, by others the Senaculum, or council-chamber. It is prostyle, and of the Corinthian order: the columns are pycnostyle, and the portico is pseudodipteral and hexastyle, or having six columns in the front. A row of columns runs on each side along the interior of the cella, which, as has been observed, leads us to suppose that it was hypæthral. It is probable that there were two ranges of columns within the cella, one above another, as at Pestum, the floor of a gallery resting on the lower tier, since the height of the exterior was such as to require two orders in the interior (where the columns were smaller) to reach the roof, the object of the columns being support, and not mere decoration. A narrow staircase at the back of the temple, concealed behind three small chambers at the end of the cella, the walls of which rise to the height of the first order of columns, confirms the belief that there was formerly a gallery. The clear space of the cell, within these chambers and the colonnade, was about forty-two feet by twenty-eight feet six inches. The interior has been painted; red and black are the predominant colours. Diamond-shaped pieces of marble form the centre division of the pavement, which is enclosed within a broad border of black and white mosaic. In the centre of the door-sill there are traces of holes for the bolts of folding doors. Upon the pavement, fragments of a colossal statue were discovered. This temple is placed on an elevated basement, or podium, which was ascended by many steps. Those nearest the columns are carried along the whole front of the portico, while the steps near the ground are narrow, and sunk in a low parapet, forming a basement to the upper flight. Greater breadth of effect and grandeur is communicated to the whole edifice by this mass of solid wall beneath the large columns which it seems to support. A magnificent example of this method of construction is to be seen in the portico of the London University. The dye of the basement inclines inwards; it is moulded above and below, and in front formed into pedestals, which are oblong, and adapted to receive equestrian statues. Near one of them a sun-dial was found. Pedestals were also added in front, at the angles of the basement of the portico. On the south-east, a side door in the basement leads to vaults beneath the temple. The whole of the building, constructed as it is of stone and lava, has been covered with a fine white cement made of marble, still retaining great hardness. The workmanship does not appear to be very good or exact. The columns, and the spaces between them, vary, none of them being equidistant. The diameters of the columns are three feet seven inches, and three feet eight inches, making their height, according to the proportions observed, approach to thirty-six feet—about the size of the lower order of St Paul's Cathedral—so that the whole height of the building was, including the basement, about sixty feet. Without the walls, its breadth was forty-three feet, and its length a hundred to the end of the portico. Add twenty feet to the flight of steps, and the total length is one hundred and twenty feet. Adjoining the south-western end of the basement, stand the ruins of an arch built of brick, and cased with slabs of white marble, fastened on the brickwork by iron clamps. This is conjectured to have been triumphal; but from its being connected with the temple of Jupiter by a low wall, reaching to the height of the adjoining basement, it is more probable that it was only the entrance to a court in front of what may have been the public granaries. This wall evidently proves that the whole was constructed, not for show, but use. Had the arch been triumphal, it would have been more solidly built,

isolated, and not disfigured by a small piece of wall attached to one side only, disfiguring also the basement of the most commanding building in the city. It may be presumed, therefore, to have formed the entrance to a court-yard before the granary and prisons, which are here situated at the north-west corner of the Forum; such a convenience being almost necessary to the former, for the unloading the grain apart from the crowd in the Forum; and to the latter, as an outlet where prisoners, it may be supposed, were allowed to take exercise under the eyes of their guards. Conduits of lead were frequently used in Pompeii, to conduct the water to the public fountains and private baths. These, however, the Neapolitan government have caused to be torn up, and sold for their value as old metal.—*Library of Entertaining Knowledge.*

ESCAPE FROM A SHARK.

Hardy, in his Travels through Mexico, gives the following lively account of an escape from a shark:—"The Placer de la Piedra Negada, which is near Loreta, was supposed to have quantities of very large pearl-oysters around it—a supposition which was at once confirmed by the great difficulty of finding this sunken rock. Don Pablo, however, succeeded in sounding it, and, in search of specimens of the largest and oldest shells, dived down in eleven fathoms water. The rock is not above one hundred and fifty or two hundred yards in circumference, and our adventurer swam round and examined it in all directions, but without meeting any inducement to prolong his stay. Accordingly, being satisfied that there were no oysters, he thought of ascending to the surface of the water; but first he cast a look upwards, as all divers are obliged to do, who hope to avoid the hungry jaws of a monster. If the coast is clear, they may then rise without apprehension. Don Pablo, however, when he cast a hasty glance upwards, found that a tintetero had taken a station about three or four yards immediately above him, and, most probably, had been watching during the whole time that he had been down. A double-pointed stick is a useless weapon against a tintetero, as its mouth is of such enormous dimensions, that both man and stick would be swallowed together. He therefore felt himself rather nervous, as his retreat was now completely intercepted. But, under water, time is too precious to be spent in reflection, and therefore he swam round to another part of the rock, hoping by this artifice to avoid the vigilance of his persecutor. What was his dismay when he again looked up to find the pertinacious tintetero still hovering over him, as a hawk would follow a bird! He described him as having large, round, and inflamed eyes, apparently just ready to dart from their sockets with eagerness, and a mouth (at the recollection of which he still shuddered) that was constantly opening and shutting, as if the monster was already, in imagination, devouring his victim, or, at least, that the contemplation of his prey imparted a foretaste of the *gout*! Two alternatives now presented themselves to the mind of Don Pablo; one, to suffer himself to be drowned; the other, to be eaten. He had already been under water so considerable a time, that he found it impossible any longer to retain his breath, and was on the point of giving himself up for lost, with as much philosophy as he possessed. But what is dearer than life? The invention of man is seldom at a loss to find expedients for its preservation in cases of great extremity. On a sudden he recollected that on one side of the rock he had observed a sandy spot, and to this he swam with all imaginable speed; his attentive friend, still watching his movements, and keeping a measured pace with him. As soon as he reached the spot, he commenced stirring it with his pointed stick, in such a way that the fine particles rose, and rendered the water perfectly turbid, so that he could not see the monster, nor the tintetero him. Availing himself of the cloud by which himself and the tintetero were enveloped, he swam very far out in a transversal direction, and reached the surface in safety, although completely exhausted. Fortunately he rose close to one of the boats; and those who were within, seeing him in such a state, and knowing that an enemy must have been persecuting him, and that by some artifice he had saved his life, jumped overboard, as is their common practice in such cases, to frighten the creature away by splashing in the water; and Don Pablo was taken into the boat more dead than alive."

SINGULAR ADVENTURE WITH A BEAR.

It was in the setting in of the winter (says Lloyd, in his *Field Sports of the North of Europe*), and when the ground was but slightly covered with snow, that Elg and another peasant started in company for a very wild range of country to the southward of Brunberg, in the hopes that they might fall in with and ring the track of a bear; this being, as I have said, the most proper season for that purpose. But their search proved unsuccessful; and after the lapse of four or five days, during which they had either bivouacked on the ground or quartered at Saterwells, their provision being exhausted, they separated for their respective homes. In the afternoon of the same day, and when Elg was alone in a very wild part of the country, covered with much fallen timber and immense fragments of stone, he suddenly came upon the track of a bear; the next minute, and within a short distance from where he stood, he discovered in a cleft of a great mass of rocks, the den of the animal. As he had no confidence, how-

ever, in the lock of his rifle, he did not care to go immediately up to the den; he therefore mounted a pretty high stone, immediately overlooking it, at about fifteen paces distant. From this position he discovered the bear lying fast asleep near the entrance of the den; and as he got sight of her ear, under which is one of the most fatal places, he lost no time in levelling and discharging his rifle. For a moment after he had fired, the bear lay still, and, in consequence, Elg almost imagined she (for it was a female) was killed; had he thought otherwise, he would have had ample time to get out of her way; but presently the bear raised herself up, when, fixing her eyes steadily upon him, and uttering at the same time a terrific growl, she dashed at him (to use his own expression) "with the rapidity of a bullet out of a gun," and was close upon him in almost the twinkling of an eye. Very fortunate for Elg, the stone on which he was standing was situated in a declivity, the after part of it being some five or six feet from the ground; down this, in his hurry to escape, he tumbled all but headlong. It was well he did so, for the bear, followed by two of her cubs, which were more than half as large as herself, almost at the same instant made her spring, and passed clean and far over him. In this situation Elg lay for a short while, frightened, as he said, almost out of his senses; when finding all quiet, and supposing, as was the case, that the bears, from not seeing him, had taken themselves off to another part of the forest, he ventured to get up, and to reconnoitre the den; he then discovered that, besides the three which had made a leaping bar of his person, a fourth had taken an opposite direction. Though all four bears for this time made their escape, yet in the course of eight or ten successive weeks, Elg, with the assistance of several other peasants, managed to kill the whole of them. On taking the skin from the old bear, which he described to have been of a very large size, he found the ball which he had fired at her flattened out, and set fast on the back of her skull. By this it would appear that he had mistaken the position in which she was lying, so that, instead of aiming at the root of her ear, as he imagined was the case, he had fired at her lengthwise. Had his ball, however, been of any moderate size, this would not have been of much consequence; for if his gun was properly loaded, I take it, that, at so short a distance, her head would have been split in pieces.

ALEPPO.

The population of Aleppo (says Fuller, in his interesting *Tour through the Turkish empire*) is considerable, and almost exclusively Mahometan; for the Ensyrian idolaters reside chiefly in the villages, and not more than a hundred Christian families are now to be found at this primitive seat of their religion, all of them Greek schismatics. To one of the principal of these—a young man named Yussuff Saba—I had letters of introduction from Moosy Elias. He received me very kindly, but excused himself from lodging me in his house, which he said was in a state of great confusion. An old steward who had lived for many years in his family was going to be married; and, according to the customs of these countries, where the distinction between master and servant is not so strongly marked as among nations which have made a greater progress in refinement, the marriage was to take place at his master's house; and Yussuff, in order to show his respect for his old domestic, had determined that it should be celebrated with due magnificence. The ceremony was not to take place till two days afterwards, but the visitings and feastings had already commenced, and the bustle of preparation was at its height. Yussuff, therefore, provided me with an apartment at the house of his brother-in-law, another wealthy Christian, where he thought I should be more quiet than in his own. During the greater part of the next day, the rain kept me in-doors, and when evening came, I was glad to seek for amusement in a visit to the wedding party. I found a large assembly, chiefly composed of the Christian inhabitants of the town, but mixed with a few of the neighbouring Ensyrian peasants. In the middle of the room was an emaciated old man, with grey hair and beard, whom I soon discovered to be the family buffoon. The company seemed much amused by his odd sayings and grotesque attitudes; but the most effective part of his wit appeared to consist in the enormous quantity of aqua-vitæ which he drank, and at every draught there was a general peal of laughter. Nor did the other guests appear less disposed to imitate than to applaud old Simone, as a small glass was handed round every quarter of an hour, and I observed very few who ever allowed it to pass. The Christians in the north of Syria are extremely addicted to aqua-vitæ, partly from taste, and partly because their Mahometan neighbours are confined to water only. Drinking they therefore esteem a distinctive mark of their religion, and their zeal and orthodoxy are gauged by the quantity of strong liquors which they are able to swallow. The other amusements of the evening were singing and dancing, in which several of the company took a part. About an hour after midnight, the party broke up, having passed the evening with the greatest harmony, and without riot or excess.

THE CASCADE OF THE RAINBOW.

Stewart, in the course of his visit to the South Seas, describes a cascade which he saw in one of the Sandwich Islands:—"There is one object worthy of notice," says he, "in the vicinity of Byron Bay, which I had not previously an opportunity of visiting—a waterfall

in the river Wairuku. We landed at the mouth of the stream, on the wild rocks forming its precipitous banks. This place has been the favourite resort of our gentlemen; and the untiring feats of the islanders, in throwing themselves from some of the highest of the adjoining cliffs, thirty, forty, and fifty feet, into the basins below, and in gliding down the falls above the watering place, at the seeming hazard of being dashed to death, have daily afforded them great amusement. In many places the bed of the river is deep, apparently unfathomable; and, at such parts especially, the embankments are bold and abrupt, forty, sixty, and a hundred feet high, and generally perpendicular. The principal object of our ramble surpassed in novelty and beauty every anticipation. It is decidedly superior, in the variety of its points of interest, to any other of the kind I have ever seen. The projection of water is one hundred and ten feet in height, and the ascent causing it, in the view had from below, appears a natural bridge, spanning the basin into which the water is poured, in one broad arch, resting on either side upon massive abutments of basaltic rock. The arch, however, instead of being open entirely through, is the entrance of a deep recess or cavern, into the darkness and gloom of which the sight can scarce penetrate. The basin beneath, a perfect circle of some hundred yards diameter, was placid as a lake, except where the stream plunges into it from above, and completely walled in save at a single narrow outlet, by precipices of rock a hundred and fifty feet or more high, richly covered with moss, fern, and shrubbery. An isolated pyramidal peak, at the base of which we stood, rises directly opposite to the cascade; its formation, like that of the arch, being almost precisely that of the Giant's Causeway, possessing the same distinctive characteristics in form and in regularity of arrangement."

SOLDIERS' FUNERALS.

There is a simplicity and a decency in a military funeral, even in its plainest form, far surpassing in solemnity all the pomp and pageantry of the most sumptuous funeral in civil life. There, a number of hirelings, whose bodies only bear the garb of woe, while their countenances, gestures, and manner, betray indifference or a hackneyed observance of form, render the last offices to the deceased; and a hired vehicle, still smelling of its last inmate, bears the body to the grave, from which, perhaps, the bones of some old tenant of the sod are displaced, to make room for the new one, destined in process of time to a similar ejection. Here, the deceased soldier is borne to his last resting-place on the shoulders of his comrades; the flag under which he fought and died is the pall which covers his remains; the sword and other emblems of his profession, which surmount the body, speak more than the most eloquent funeral oration to the heart of the spectator; the martial music, in solemn cadence, disposes the soul to suitable emotions; the fresh grave, open to receive its first offering; the short but affecting ritual is pronounced by the lips of a brother soldier, perhaps in the faltering accents of friendship; and the last volley seems to announce the entrance of the immortal part into the portals of eternity.—*Twelve Years' Military Adventures.*

PLEASURE.

In the common actions and diversions of our lives, the pleasure lies almost entirely in the pursuit and very little in the attainment. He that at whist should have four honours, six trumps, always dealt him, would lose his whole diversion, because he would have nothing to do but throw down his cards and win the game. In bowling, the player takes care to deliver his bowl aright; he runs after it, chides it, encourages it, writhes his body in all manner of contortions, as if to influence its bias, and in this consists his entertainment, for the joy of winning the game is over in a moment; he takes his stake, pockets it, and only thinks where to throw the jack for beginning another cast.—*Tucker's Light of Nature.*

IMPERIAL ANECDOTE.

Napoleon, when sailing in a yacht in Holland, entered into conversation with the steersman, and asked him how much his vessel was worth? "My vessel!" said the man; "it is not mine: I should be too happy if it were: it would make my fortune." "Well, then," said the emperor, "I make you a present of it;" a favour for which the man, seemed not particularly grateful. His indifference was imputed to the phlegmatic temperament natural to his countrymen; but this was not the case. "What benefit has he conferred on me?" said he to one of his comrades, who was congratulating him; "he has spoken to me, and that is all: he has given me what was not his own to give—a fine present truly!" In the meantime, Duroc had purchased the vessel of the owner, and the receipt was put into the hands of the steersman, who, no longer doubting the reality of his good fortune, indulged in the most extravagant demonstrations of joy.—*Las Cases.*

TO RESTORE FROSTED POTATOES.

This is partially done by steeping potatoes, or any other frosted vegetable, in cold water till thawed. A better and more effectual method has been discovered by a Cumberland gentleman. This remedy is simply to allow the potatoes to remain in the pits after a severe frost, till the mild weather has set in for some weeks, and allow them to recover gradually. If once exposed to the atmospheric air, no art will recover frosted potatoes.

A CITY OF THE PLAGUE.

The following account, given by Fuller, of a city labouring under the horrors of plague, cannot be perused without exciting a painful interest on the present occasion:—"We were," says he, in his *Turkish Tour*, "closely confined within the walls of the consulate, and all persons from without were as rigidly excluded. The gate which opened from the court into the street was strictly closed, and the only communication was through a hatch-door cut in it. The key of this was not entrusted even to the servants. Each of the company took charge of it in his turn for a day, and it was his business to see that every thing supposed capable of communicating the contagion was duly purified before it was allowed to pass into the house. These precautions were at any rate useful, as giving a feeling of security; but I have no doubt that the distinction between such objects as are called 'susceptible' (to use the technical phrase) and such as are not, is frequently arbitrary, and that the *index expurgatorius* in this, as in other instances, is tinged by prejudice and caprice. Happily, some of the articles of most frequent use, such as bread, iron, and wood, for example, were allowed to pass without suspicion; but meat and all animal substances, and money of every kind, were thrown with iron tongs or shovels into a large tub, and compelled to pass through the watery ordeal. Letters, books, and papers, on the other hand, are purified by fire, or at least by smoke, being placed on a sort of chafing-dish, and fumigated with a compound of drugs, which is any thing but aromatic; and if it should be necessary to affix a signature to any document, a plate of glass is introduced between the paper and the hand of the writer. The cats, who in their nocturnal rambles are supposed to carry with them the seeds of contagion, are condemned to indiscriminate slaughter whenever they are seen creeping along the walls or on the house tops; and when terror is at its height, even the flies are objects of alarm, and the sports of Domitian are revived."

ATHENS.

"We landed in the Piræus," says the Honourable George Keppel, a recent traveller in the East, "early in the morning, a party of nineteen from the ship. We shortly afterwards entered the gates, which were guarded by regular Turkish troops, and proceeded to visit the Bey, who lived in a house wretched enough, but the best in the town. The first object that met our view in the courtyard was the head of a Greek, hanging up by its long hair. By the appearance of the features, and the slightness of the moustache, it was that of a very young man. We partook of pipes, coffee, and sweetmeats, and offered in return that without which we should have been most unwelcome visitors—a hamper containing six bottles of rum. The visit of ceremony performed, we went over the ruins. Ancient Athens has survived its successor; the pillars of majestic temples still stand, while shapeless heaps are nearly the only indications of the modern town. With the exception of the Turkish garrison, a few squalid looking Greeks, who cultivated the fields in the vicinity of the town, were the only population to be seen. After we had visited every thing worthy of notice within the walls, we went outside to see the superb temple of Adrian, walking in perfect ease and security between the Turkish garrison on our right hand, and the Greek army, who were in possession of the heights, at no great distance, on our left."

THE ISRAELITES OF MOUNT LEBANON.

Edward Daniel Clarke, one of the most pleasing of our modern descriptive travellers, and whose lamented death occurred in 1822, in the course of his life visited various countries, and has left behind him many works of great interest. About the beginning of the present century, he travelled through Russia, Egypt, and Palestine, every where making such observations on the character and manners of these nations as might have been expected from a gentleman of refined feeling and a scholar. When in Palestine, he visited Jerusalem, Nazareth, Bethlehem, and the Lake of Gennesareth, near which he enjoyed an opportunity of conversing with a party of Druzes. Almost every traveller in Syria has given us some new particulars respecting this curious people:—"They are," says Clarke, "the most extraordinary people on earth; singular in the simplicity of their lives, by their strict integrity and virtue. They only eat what they earn by their own labour, and preserve at this moment the superstitions brought by the Israelites out of Egypt. What will be your surprise to learn, that every Thursday they elevate the molten calf, before which they prostrate themselves; and having paid their adoration, each man selects a wife from among the women present! The calf is of gold, silver, or bronze. This is exactly that worship at which Moses was so incensed in descending from Mount Sinai. The cow was the Venus of the Egyptians, and of course the calf was a Cupid, before which the sacrifices so offensive to Moses were held. For it is related, that they set up a molten calf, which Aaron had made from the earrings of the Israelite women, before which similar sacrifices were made. And certainly the Druzes on Mount Lebanon are a detachment of the posterity of those Israelites who are so often represented in Scripture as deserters from the true faith, falling back into the old superstitions and pagan worship of the country from whence they came. I took every method necessary to ascertain the truth of this relation; and I send it you as one of the highest antiquities and

most curious relics of remote ages which has yet been found upon earth."

LORD STANHOPE'S CALCULATION ABOUT SNUFF-TAKING.

Every professed, inveterate, and incurable snuff-taker, at a moderate computation, takes one pinch in ten minutes. Every pinch, with the agreeable ceremony of blowing and wiping the nose, and other incidental circumstances, consumes a minute and a half. One minute and a half out of every ten, allowing sixteen hours to a snuff-taking day, amounts to two hours and twenty-four minutes out of every natural day, or one day out of ten. One day out of every ten amounts to thirty-six days and a half in the year. Hence, if we suppose the practice to be persisted in for forty years, two entire years of the snuff-taker's life will be dedicated to tickling his nose, and two more to blowing it. The expense of snuff boxes and handkerchiefs will be the subject of a second essay, in which it will appear that this luxury encroaches as much on the income of the snuff-taker as it does on his time, and that, by proper application of the time and money thus lost to the public, a fund might be constituted for the discharge of the national debt.

HEAT.

One of the chief agents in chemistry, on whose proper application and management the success of a great number of its inquiries depends, and many of whose most important laws are disclosed to us by phenomena of a chemical nature, is *heat*. This word generally implies the sensation which we experience on approaching a fire; but in the sense it carries in physics, it denotes the cause, whatever it be, of that sensation, and of all the other phenomena which arise on the application of fire, or of any other heating cause. The most obvious sources of heat are, the sun, fire, animal life, fermentation, violent chemical actions of all kinds, friction, perception, lightning, or the electric discharge, in whatever manner produced, the sudden condensation of air, and others, so numerous, and so varied, as to show the extensive and important part it has to perform in the economy of nature. The discoveries of chemists, however, have referred most of these to the general head of chemical combination. Thus, fire, or the combustion of inflammable bodies, is nothing more than a violent chemical action attending the combination of their ingredients with the oxygen of the air. Animal heat is, in like manner, referable to a process bearing no remote analogy to a slow combustion, by which a portion of carbon, an inflammable principle existing in the blood, is united with the oxygen of the air in respiration, and thus carried off from the system: fermentation is nothing more than a decomposition of chemical elements loosely united, and their re-union in a more permanent state of combination. The analogy between the sun and terrestrial fire is so natural, as to have been chosen by Newton to exemplify the irresistible force of an inference derived from that principle. But the nature of the sun, and the mode in which its wonderful supply of light and heat is maintained, are involved in a mystery which every discovery that has been made, either in chemistry or optics, so far from elucidating, seems only to render more profound. Friction as a source of heat is well known; we rub our hands to warm them, and we grease the axles of carriage-wheels to prevent their setting fire to the wood—an accident which, in spite of this precaution, does sometimes happen. But the effect of friction, as the means of producing heat with little or no consumption of materials, was not fully understood till made the subject of direct experiment by Count Rumford, whose results appear to have established the extraordinary fact, that an unlimited supply of heat may be derived by friction from the same materials. Condensation, whether of air by pressure, or of metals by percussion, is another powerful source of heat. Thus, iron may be dexterously hammered so as to become red hot, and the rapid condensation of a confined portion of air will set tinder on fire.—*Herschell.*

ORANGES.

Of this cheap luxury, those chiefly used in England, are from Portugal, Malta, the Barbary coast, and Seville; but by far the greatest number are from Seville, the export from which equals that of all these other places. About forty vessels are yearly freighted with oranges from Seville; each cargo consists of 400 chests, and each chest contains 800 oranges; so that the average number exported from Seville is 12,800,000 oranges; of this number about 1-10th part are bitter. The price paid by the London merchant to the Seville exporter is 120 reals a chest, which is 4½d. per dozen, or a farthing and a half each; so that if the freight and other expenses be added, one can scarcely expect a good orange under a penny. The cargo of each vessel is generally consigned to about ten persons; so that the trade is a secure one, and to the grower sufficiently profitable. The best oranges are allowed to remain long on the tree; the tree blossoms in March, and the choicest fruit still hangs on the tree when the blossom of another crop begins to appear. The Spaniards do not esteem them as thoroughly ripe till then; but in this state they are, of course, unable to bear exportation. The chief part of the export takes place in November and December, and a small number are shipped in January; if the fruit shipped so late as this, happens to be detained long on the voyage, the greater part of it arrives in England in a state unfit for use; but if the voyage be short, this is the finest

fruit that comes to the English market.—*Inglist's Spain.*

COMFORTS OF TRANSPORTATION.

The following extract is explanatory of the "comforts" enjoyed by convicts in Van Dieman's Land and New South Wales:—

Comfort 1st.—As soon as he lands, he is packed off sixty or seventy, or one hundred miles, into the interior, or he is placed in the prisoners' barracks—of which it would be only necessary for an hon. member to see the inside to convince him it was no joke—in either of which cases, if he has brought any trifles with him, he is sure to be relieved of them before the following day. If he does not lose his government clothing, he may consider himself fortunate; should he, however, do so, the following morning he may safely calculate upon

Comfort 2d.—In the shape of fifty lashes, or ten days' work on the tread-mill, or in the chain-gang.

Comfort 3d.—If he be assigned to a master in the town, and happens to take a glass of grog after his long voyage, it is a great chance if he lodge not in the watch-house for the night, and take "fifty" before breakfast in the morning, by way of "comfort."

Comfort 4th.—Travelling through a wild forest, without knowing his way, and surrounded, perhaps, by the hostile aborigines, who, so sure as they met, would kill him.

Comfort 5th.—Should he lose his way, and escape starvation in the bush, probably a sound flogging for not having arrived sooner at his master's house.

Comfort 6th.—Perpetual work, and no pay—in many cases hard labour, hard living, hard words, and hard usage.

We have hitherto spoken only of the reception met with by a well-disposed prisoner—one who wishes to reform. If he be in any way refractory, let the good people of England thoroughly understand that he is sure of a most adequate reward. A short answer, when spoken to by his master or overseer, or a common soldier, or even a convict constable, is a crime punishable by flogging; getting tipsy places him in the stocks; missing muster, may get him flogged, or into the chain-gang, where he works in irons on the roads. Should he commit any second offence, Macquarie Harbour, Port Macquarie, Norfolk Island, or Moreton Bay, is his fate, where every rigidity of discipline—nay, sometimes even cruelty—is exercised. The hardest of labour, and but one meal a-day, of the coarsest food, is the lot of the man who goes to a penal settlement. To these places it does not take felony to send a prisoner; many have been removed there for very trivial offences. The gallant colonel who wishes for places of horror and terror as receptacles for criminals, need not go far a-field; we can supply him with such places as would satisfy the most insatiate appetite for torturing and punishing. When men commit murder on purpose to be hanged, in preference to bearing the terrors of these places of secondary exile, it cannot be expected that they are in the enjoyment of much "comfort." This is no exposition tirade; nor is the statement made for our colonial readers; the facts are too well known here to require description. It is a true picture, intended for the eye of our numerous English readers.

DISTILLATION FROM MILK.

The possibility of obtaining ardent spirits from milk has been disputed by many chemists, but the experiments of Oseretshouesky of Petersburg have proved that it is possible. The result of his experiments is, that milk does not undergo the vinous fermentation, if the butter and cheese are taken from it—either must remain; and that whey, although it contains the whole of the sugar of milk, does not enter into the vinous fermentation, even although yeast be added.

FECONDITY OF THE VIPER.

Mr Robineau Desvoidy lately stated at the Academy of Sciences, that, on opening a viper, he found in the uterus more than 3000 little ones, in different states. We do not know what species of viper this was, but we know that on opening one of our own vipers from the island of Arran, we found only twelve young ones in it, which occupied the whole extent of the abdominal cavity.

SCOTCH AND ENGLISH.

The national precedence between the English and Scotch may be settled by this, that the Scotch are always asserting their superiority over the English, while the English never say a word about their superiority over the Scotch. The first have got together a great number of facts and arguments in their own favour; the last never trouble their heads about the matter, but have taken the point for granted as self-evident.—*Haslitt's "Characteristics."*

MICHAEL ANGELO.

Michael Angelo's seal represented three rings enclosed one within the other, as expressive of the union which he had made in his mind of the three arts of painting, sculpture, and architecture. Michael Angelo lived to a very great, yet healthy old age. In the beginning of the 18th century, the Senator Buonarroti caused the vault to be opened at Florence in which his body was deposited. It was found perfect; and the dress of green velvet, and even the cap and slippers in which he was buried, were entire. He appeared to have been a small, well-set man, with a countenance of great severity.

COLUMN FOR THE FANCY.

EXTRAORDINARY SHOOTING EXPLOITS.

In 1809, Messrs Austin and Foster shot upon the manor of Fobsey Magnus, in Cornwall, and killed, in the course of the day, 43 brace of birds. In addition to his partridges, Mr Austin killed five hares and a water-rail. Both gentlemen used spectacles.

On the 3d of September, Mr Lacey, of Wimborne-minster, shot upon the manor of Verwood, Dorsetshire, which contains only 2500 acres, thirty brace of partridges, ten brace of hares, and twelve couple of rabbits. He commenced his day's sport with the rising sun, and closed it at four o'clock. He was attended by six servants and four couple of pointers.

Lord Kingston made a considerable bet, to shoot forty brace of partridges on the 1st of September, on the manor of Heydon. He shot forty-one brace and a half.

On the 28th of January 1812, John Moseley, Esq. of Tofts, Norfolk, accompanied by eight friends, within five hours killed 8 partridges, 12 hares, 1 woodcock, 28 rabbits, 275 pheasants, amounting in the whole to 325, notwithstanding that nearly 600 pheasants had before been bagged on the same manor.

In the same year (1812), there were killed upon the manor of Riddlesworth, in Norfolk, 574 hares, 725 partridges, 701 pheasants, 49 snipes, 6 woodcocks, and 3402 rabbits, making in the whole 5548.

In 1811, when Lord Moira (Marquis of Hastings) and several other shots of distinction were on a visit to Mr Coke, in Norfolk, the following were bagged in six days:—264 pheasants, 314 partridges, 29 woodcocks, 46 snipes, 283 hares, 371 rabbits; total bagged, 1307.

In December 1808, at Gipping, near Stowmarket, the seat of Sir John Shelley, 91 hares, 64 pheasants, and 101 rabbits, were killed in one day by seven gentlemen.

The Duke of Rutland, at Cheveley Park, attended by his gamekeeper, killed 109 head of game. On the following day, all the sporting gentlemen and park-keepers went out, and killed as much game as filled four one-horse carts! The whole was dressed on the day of the grand jubilee.

ANECDOTE OF THE LATE LORD ORFORD.

No man ever sacrificed so much time or so much property on practical or speculative sporting, as the late Earl of Orford, whose eccentricities are too firmly indented upon "the tablet of the memory" ever to be obliterated from the diversified rays of retrospection. Among his experiments of fancy was a determination to drive four red-deer stags in a phaeton, instead of horses, and these he had reduced to perfect discipline for his excursions and short journeys upon the road; but, unfortunately, as he was one day driving to Newmarket, their ears were saluted with the cry of a pack of hounds, which, soon after crossing the road in the rear, caught scent of the "four-in-hand," and commenced a new kind of chase, with "breast high" alacrity. The novelty of this scene was rich beyond description: in vain did his lordship exert all his chariot-driving skill—in vain did his well-trained grooms energetically endeavour to ride before them; reins, trammels, and the weight of the carriage, were of no effect, for they went with the celerity of a whirlwind; and this modern Phaeton, in the midst of his electrical vibrations of fear, bade fair to experience the fate of his namesake. Luckily, however, his lordship had been accustomed to drive this set of "fiery-eyed steeds" to the Ram Inn, at Newmarket, which was most happily at hand, and to this his lordship's most fervent prayers and ejaculations had been ardently directed. Into the yard they suddenly bounded, to the dismay of ostlers and stable boys, who seemed to have lost every faculty upon the occasion. Here they were luckily overpowered, and the stags, the phaeton, and his lordship, were all instantaneously huddled together in a barn, just as the hounds appeared in full cry at the gate.

RUNNING IN A SACK.

In the month of November 1811, a wager was run, for ten guineas a-side, in White Conduit Fields, between two tradesmen of the names of Williams and Johnson, of the neighbourhood of Islington: the one was to run one hundred yards in a sack in less time than the other should go twice the distance in the common way of running. A vast number of persons assembled to witness the novelty, and a great many bets were depending upon the issue; odds were three to one against Williams in the sack. They started at four o'clock; almost directly afterwards, the man in the sack fell down, and the other, by some accident, tumbled over him, and they both scrambled to get up; the former, though in the sack, being the most active, recovered himself first, and won the wager by about twenty seconds.

THE EXPEDITIOUS HIGHWAYMAN.

In 1796, — Nicks, a noted highwayman, robbed a gentleman at Gad's Hill, in Kent, about four in the morning. Nicks, apprehending that he was known to the person he had robbed, made for Gravesend, where he lost a whole hour in waiting for the ferry-boat; yet, by crossing the country to Huntingdon, and then keeping to the northern road, he reached York, and appeared on the bowling-green in the evening, as he proved upon his trial for this robbery. The jury acquitted him, thinking it impossible he could be at two places so greatly distant between sun and sun.

DEAFNESS OF THE AGED.

Nothing is more common than to hear old people utter querulous complaints with regard to their increasing deafness; but those who do so are not perhaps aware that this infirmity is the result of an express and wise arrangement of Providence in constructing the human body. The gradual loss of hearing is effected for the best of purposes; it being to give ease and quietude to the decline of life, when any noises or sounds from without would but discompose the enfeebled mind, and prevent peaceful meditation. Indeed, the gradual withdrawal of all the senses, and the perceptible decay of the frame, in old age, have been wisely ordained in order to wean the human mind from the concerns and pleasures of the world, and to induce a longing for a more perfect state of existence.—*Ed.*

DANISH CHARACTER.

The character of the Danes is generally that of a quiet and intelligent people, of rather cold demeanour, and difficult of access, but very sincerely hospitable when the threshold of their door is passed. Their personal appearance resembles very remarkably that of the Lowland Scots. Of the lower orders, almost all have light hair; but it is observed that dark hair predominates among the middle classes, of whom a great proportion are foreign settlers. They are a nation of deep devotion to their country; and blown about as they have been by reverses, it is not unnatural that they should cling to their country with something of a passionate love, and that they should become eloquent in their vituperation of those whom they deem to have injured her. In such strains the songs of their poets commonly flow. There is, perhaps, no people which possess such a mine of patriotic poetry. From them assuredly Campbell must have borrowed the idea of his beautiful "Ode on the Battle of the Baltic," which very closely resembles in its construction the Danish National Hymn, "Kong Christian stod ved høien mast;" ("King Christian by the mainmast stood.")

NAPOLI DI ROMANIA.

"Napoli di Romania," says Keppel, "is the strongest, perhaps nearly the only, stronghold the Greeks possess. The principal works consist in the fortifications of Palmades, which occupy the heights that overhang the town. I was told, that a short time before I came, Count Heyden, in the expectation of a war with England, furnished the fort with guns, with the intention that they should be employed against us, in case of a rupture with our country."

ICELANDIC ADMONITIONS.

A venerable Icelandic writer, who lived at the end of the twelfth century, gives the following excellent advice for self-government, which it may surprise many a one should come from such a country, and from so remote a period:—"Accustom thyself to a busy and wakeful life, but not so as to injure health by over exertion. Keep aloof from sadness, for sadness is sickness of soul. Be kind and gay, equitable and changeable [that is, of easy manners, and not stiff.] Avoid evil speaking, and give your counsel to him who will accept it. Seek the company of the best men. Keep thy tongue carefully; it may honour—it may also condemn thee. If thou wast angry, speak little, and that little not vehemently. Men would give gold sometimes to buy back a passionate word, and I know of nothing that so destroys unity as the exchange of evil language, especially in the moment of strife; and there is no nobler, no higher power, than that by which a man can keep his own tongue from cursing, slandering, and other foolish prate. There are other things to be avoided like the fiend himself—as sensual excesses, gaming, wagers, and other improprieties and vices. These are the roots of many worse evils, and, unless great care be taken, will hand thee over to great shame and sin."

BON MOT.

On one occasion the late Dr Barclay happened to dine in a large party, which was composed chiefly of medical men. As the wine-cup circulated, the conversation accidentally took a professional turn, and from the excitement of the moment, or some other cause, two of the youngest individuals present were the most forward in delivering their opinions. Sir James Macintosh once told a political opponent, that so far from following his example of using hard words and soft arguments, he would pass, if possible, into the opposite extreme, and use soft words and hard arguments. But our unfledged M.D.'s disregarded the above salutary maxim, and made up in loudness what they wanted in learning. At length, one of them said something so emphatic—we mean as to manner—that a pointer dog started from his lair beneath the table, and *bow-wow-wowed* so fiercely that he fairly took the lead in the discussion. Dr Barclay eyed the hairy dialectician, and thinking it high time to close the debate, gave the animal a hearty push with his foot, and exclaimed, in good broad Scotch, "I'm still, ye brute; for I am sure ye ken just as little about it as any o' them." We need hardly add, that this sally was followed by a hearty burst of laughter, in which even the disputants good-naturedly joined.

EDINBURGH: Published, weekly, by W. and R. Chambers, 19, Waterloo Place; and Orr & Smith, Paternoster-row, London; and Young and Cunningham, Dublin.—Agent in Glasgow, John Argyll Street, and sold by all other Booksellers in Great Britain and Ireland.

PRICE THREE HALFPENCE.

THE PASSING CROWD.

THE "Passing Crowd" is a phrase coined in the spirit of indifference. Yet, to a man of what Plato calls "universal sympathies," and even to the plain ordinary denizens of this world, what can be more interesting than "the passing crowd?" Does not this tide of human beings, which we daily see passing along the ways of this world, consist of persons animated by the same spark of the divine essence, and partaking of the same high destinies with ourselves? Let us stand still but for a moment in the midst of this busy and seemingly careless scene, and consider what they are or may be whom we see around us. In the hurry of the passing show, and of our own sensations, we see but a series of unknown faces; but this is no reason why we should regard them with indifference. Many of these persons, if we knew their histories, would rivet our admiration by the ability, worth, benevolence, or piety, which they have displayed in their various paths through life. Many would excite our warmest interest by their sufferings—sufferings, perhaps, borne meekly and well, and more for the sake of others than themselves. How many tales of human weal and woe, of glory and of humiliation, could be told by those beings, whom, in passing, we regard not! Unvalued as they are by us, how many as good as ourselves repose upon them the affections of bounteous hearts, and would not want them for any earthly compensation! Every one of these persons, in all probability, retains in his bosom the cherished recollections of early happy days, spent in some scene which "they ne'er forget, though there they are forgot," with friends and fellows who, though now far removed in distance and in fortune, are never to be given up by the heart. Every one of these individuals, in all probability, nurses still deeper in the recesses of feeling, the remembrance of that chapter of romance in the life of every man, an early earnest attachment, conceived in the fervour of youth, unstained by the slightest thought of self, and for a time purifying and elevating the character far above its ordinary standard. Beneath all this gloss of the world—this cold conventional aspect, which all more or less present, and which the business of life renders necessary—there resides for certain a fountain of goodness, pure in its inner depths as the lymph rock-distilled, and ready on every proper occasion to well out in the exercise of the noblest duties. Though all may seem but a hunt after worldly objects, the great majority of these individuals can, at the proper time, cast aside all earthly thoughts, and communicate directly with the being whom their fathers have taught them to worship, and whose will and attributes have been taught to man immediately by Himself. Perhaps many of these persons are of loftier aspect than ourselves, and belong to a sphere removed above our own. But, nevertheless, if the barrier of mere worldly form were taken out of the way, it is probable that we could interchange sympathies with these persons as freely and cordially as with any of our own class. Perhaps they are of an inferior order; but they are only inferior in certain circumstances, which should never interpose to prevent the flow of feeling for our kind. The great common features of human nature remain; and let us never forget how much respect is due to the very impress of humanity—the type of the divine nature itself! Even where our fellow-creatures are degraded by vice and poverty, let us still be gentle in our judging. The various fortunes which we every day see befalling the members of a single family, after they part off in their several paths through life, teach us that it is not to every one that success in the career of existence is destined. Besides, do not the arrangements of society at once necessitate the subjection of

an immense multitude to humble toil, and give rise to temptations, before which the weak and uninstructed can scarcely escape falling? But even beneath the soiled face of the poor artisan, there may be aspirations after some vague excellence, which hard fate has denied him the means of attaining, though the very wish to obtain it is itself ennobling. The very mendicant was not always so; he, too, has had his undegraded and happier days, upon the recollection of which, some remnant of better feeling may still repose.

These, I humbly think, are reasons why we should not look with coldness upon any masses of men with whom it may be our lot to mingle. It is the nature of a good man to conclude that others are like himself; and if we take the crowd promiscuously, we can never be far wrong in thinking that there are worthy and well-directed feelings in it as well as in our own bosoms.

TAM O' THE COWGATE.

THIS ludicrous name was conferred by King James the Sixth, of facetious memory, upon one of the most sagacious and respectable of his councillors, the first Earl of Haddington, who happened to reside in that dingy and now much despised street, the Cowgate of Edinburgh. Thomas Hamilton, who raised himself by his talents from the Scottish bar to the peerage, and became the founder of a great family, was perhaps the most remarkable public man of his age, next to Napier of Merchiston, and possibly one or two others; yet he is hardly known to the present generation. We happen to be able to remedy this defect to a very surprising degree; for circumstances have put us in possession of a number of traditionary and historical anecdotes respecting him, such as may bring him almost alive before the mind of a modern reader, in full connection with all contemporary circumstances. We may indeed be permitted to remark, that rarely can such a minute and faithfully drawn picture, as that which follows, be presented two hundred years after the subject of it is in his grave.

THOMAS HAMILTON, otherwise called TAM O' THE COWGATE, is represented, in Douglas's Peerage, as the son of Hamilton of Priestfield, a branch of the house of Innerwick, which in its turn was a cadet of the noble house of Hamilton. Scott of Scotstarvit tells us, in his "Staggering State of Scots Statesmen," a very acrimonious and curious memoir, that his grandfather was a merchant in the West Bow of Edinburgh. If such was the case, it only renders the elevation of him of the Cowgate a little more honourable. The mother of our hero was Elizabeth Heriot, of the family of Trabrown, probably a relation of Agnes Heriot of Trawbrown, the mother of George Buchanan. He was born in the year 1563, received his university and legal education in France, and commenced practice in Edinburgh, as an advocate, in 1587. His talents very soon attracted attention. In 1592, he was raised to the bench, under the title of Lord Drumcarn. In 1595, he secured the office of King's Advocate; and next year he was found in the list of eight persons to whom King James committed the charge of all the state patronage and finances, and who from their number were called *Octavians*. After the departure of James from Scotland, in 1603, Tam o' the Cowgate was one of the Commissioners appointed on the part of Scotland to manage the proposed union with England; a scheme, however, which was not destined to be crowned with success for another century.

As he now enjoyed some very lucrative offices, and was singularly moderate in his expenses, he soon waxed rich. There was at this time a great deal of church

land under a very uncertain sort of proprietary, being only enjoyed by persons who had received grants of it from the Protestant regents in the minority of King James, and liable, it was generally thought, to be revoked, and again applied to ecclesiastical purposes, whenever the crown should be strong enough to carry such a measure into effect. This land came into the market occasionally in large lots, and was sold at low prices proportioned to the likelihood of its revocation. King James, after his translation to England, and subsequently King Charles, were perpetually threatening to restore the church to its former wealthy condition: the proprietors were of course in a state of great alarm during nearly the whole of these reigns. But Tam o' the Cowgate, who was himself a sturdy Presbyterian, appears to have had the shrewdness to see that the sovereign would never be able to effect a purpose so contrary to the genius of the nation; and, accordingly, he bought the lands with as much confidence as the sellers disposed of them with fear. He began his purchases in 1597, and in the course of about thirty years had acquired about twenty large estates, besides all the vast territories and jurisdictions which had once belonged to the Knights of St John, the successors of the Templars. On some of these estates he wrought gold and silver mines. This is not believed to have ever been a very profitable business in Scotland, though certainly the country is not deficient in these precious metals. Tam, however, was one of those persons who can make silk purses out of sows' ears. Having worked a silver mine in Linlithgowshire into something like a good character, he sold it to King James for five thousand pounds; and it is said that the poor monarch never made five shillings more by the concern, the vein being in reality exhausted.

As he increased in wealth, he increased in dignity, and was promoted in office. In 1612, he was appointed Lord Clerk Register, and Secretary of State, two excellent offices, though the salary attached to the latter was only one hundred pounds. In the following year he was raised to the peerage, under the title of Lord Binning and Byres, and in 1616 he succeeded Lord Preston as President of the Court of Session, a seat which it was not then illegal for a peer to hold, though so declared to be in the subsequent reign. "For many years," says Mr Tytler, in his *Life of Sir Thomas Craig*, "he [Lord Binning] conjoined, with apparent ease to himself, and acknowledged advantage to the country, the occupations of these high offices. Nor was this all: he was a friend and patron of learned men; he was deeply read, not only in civil law, but in matters of state policy, and in general history. To those who, ignorant of its proper distribution, complain of the want of time, it may form a useful lesson to regard the multitudinous labours of this remarkable man. According to our modern notions of intellectual labour, the various notes and observations collected by him in the course of his studies, and the marginal references yet seen upon his books, would rather appear the relics of a life wholly devoted to literary labour, than the fruits of those scattered hours which must have been stolen from the duties of the bench, the severer labours of the council-board, or the pleasures and intrigues of a court." As a judge, he was chiefly remarkable for his shrewdness. "In an action for the improbation of a writ," says Forbes, in his *Journal of the Court of Session*, "which the lords were convinced was forged, but puzzled for want of clear proof, the Lord Binning, taking up the writ in his hand, and holding it betwixt him and the light, discovered the forgery by the stamp of the paper, the first paper of such a stamp being posterior to the date of the writ quarrelled." On another

occasion, a Highland witness had come to give evidence for his chief. The feudal ideas of clanship are well known, even in the present day, to be on some occasions opposed to the fair explication of the truth; and, if so now, it was still more the case in the time of Tam o' the Cowgate. Terror, however, and the questions of the President, had overpowered in Donald the love of the clan, and he had been compelled to tell the tale as it happened. On coming out of court, he met a clansman who had arrived on the same errand, and was going in to be examined. "Well, Donald," said he, "how did you come on?" "God knows!" replied his bewildered friend, "my wits are not just settled yet. But I am afraid I have told the truth." "Indeed! how could you do such a thing?" "Oh! to be sure, I began, and was going to tell my own way, when an awful man that sits in the middle broke in upon me with such a multitude of interrogatories, as they call them, that he quite dumfounded me, and then I lay at his mercy, and he whirled the truth out of me as easy as ye would wind the thread off a pin. He's a tall man, with a velvet cap on, and an eye in his head as quick and bright as a partridge. If ye would tell a good tale of the chief, beware of him!"*

In 1619, Tam was created Earl of Melrose, being then in possession of the lands of that abbacy. About eight years after, he procured this title to be changed for that of Haddington, on the plea that it was more honourable to have his *style* from a town than from a "kirk-living." But his descendant, the present earl, has recently regained the interesting title of Melrose, on being raised to the British peerage, which is the last, and not the least deserved honour of the family.

When Mylne wrote his account of Melrose, about 1750, he found a tradition, that the first earl was a somewhat severe landlord, and had thereby provoked the satire of Mr Thomas Forrester, the eccentric and poetical minister of that parish. It is not supposed, however, that there was any farther reason for such an unfavourable report, than that the earl was a good lawyer, and, as such, probably seemed strict in his claims upon his vassals and feuders. Though he was perhaps anxious to turn every thing to the best account, and certainly must have been possessed of great talents for money-making, since he became the richest man of his time in Scotland, he is not remembered as having been what is called *miserly*—a disposition as seldom connected with a degree of ambition like his, as is want of foliage the characteristic of tall trees. On the contrary, to judge by the traditions of his family, he possessed a vivacity of temper not generally enduring of the slow pace of avarice. The old lord was one evening, after a day's hard labour in the public service, solacing himself with a friend, over a flask of wine, in his house in the Cowgate—attired for his better ease in a nightgown, cap, and slippers—when he was suddenly disturbed by a great hubbub, which arose under his window in the open street. This soon turned out to be a *bicker* between the High School youths and those of the College; and it also appeared that the latter, fully victorious, were, notwithstanding a valiant defence, in the act of driving their antagonists before them. The Earl of Haddington's sympathies were instantly and warmly awakened in favour of the retiring party, for he had been brought up at the High School, and going from thence to complete his education at Paris, had no similar reason to affect the College. He therefore sprang up, dashed into the street, sided with and rallied the fugitives, and took a most animated share in the combat that ensued, so that, finally, the High School youths, acquiring fresh strength and valour at seeing themselves befriended by the prime judge and privy-councillor of their country (though only in his nightgown and slippers), succeeded in turning the scale of victory upon the College youths, in spite of their superior individual ages and strength. The earl, who assumed the command of the party, and did not hesitate to excite their spirits by word as well as action, was not content till he had pursued the Collegians through the Grassmarket, and out at the West Port, the gate of which he locked against their return, thus compelling them to spend the whole night in the suburbs and fields. He then returned home in triumph to his castle of comfort in the Cowgate, and resumed, where he had left off, the enjoyment of his friend and flask. We can easily imagine what a rare jest this must have been for "King Jamie."

When this monarch visited Scotland in 1617, he found the old statesman very rich, and was informed that the people believed him to be in possession of the Philosopher's Stone; there being no other feasible mode of accounting for his immense wealth, which rather seemed the effect of supernatural agency than of worldly prudence or talent. King James, quite tickled with the idea of the Philosopher's Stone, and of so enviable a talisman having fallen into the hands of a Scottish judge, was not long in letting his friend and gossip know of the story which he had heard respecting him. Whether the Lord President was offended at the imputation, has not been recorded; but it is probable that he took it in good part, as he immediately invited the king, and the rest of the company present, to come to his house in the Cowgate next day,

when he would both do his best to give them a good dinner, and lay open to them the whole mystery of the Philosopher's Stone. This agreeable invitation was of course accepted; and the next day accordingly saw his castle thronged with the gay and gorgeous figures of England's king and courtiers, all of whom the President feasted to their hearts' content. After dinner, the king remained him of his Philosopher's Stone, and expressed the utmost anxiety to be speedily made acquainted with so rare a treasure, when the pawky lord addressed his majesty and the company in a short speech, concluding with this information, that his whole secret lay in two simple and familiar maxims—"Never put off till to-morrow what can be done to-day—nor ever trust to another's hand what your own can execute." He might have added, from the works of an illustrious contemporary,

This only is the witchcraft I have used.

The guests, who expected to find the earl's talisman of a more tangible character, were perhaps disappointed that the whole matter turned out to be, like the subject of Hamlet's reading, mere "words;" but the king, who could appreciate a good saying, took up the affair more blithely, and complimented his host upon the means he had employed in the construction of his fortune, adding, that these admirable apophthegms should henceforth be proverbial, under the appellation of "TAM O' THE COWGATE'S PHILOSOPHER'S STONE." The king appears to have been obeyed in this by his Scottish subjects with more readiness than he found in certain other of the edicts which he issued upon the occasion of his visit to Scotland; for, long after the Episcopal forms of worship which he then engrafted upon Presbyterianism had passed away and been forgotten, *Tam o' the Cowgate's Philosopher's Stone* was remembered with satisfaction, and it has even been used as an adage within the recollection of aged persons still alive.

A striking and most ludicrous idea may be obtained from the following anecdote, of the estimation in which the wisdom of the Earl of Haddington was held by the king, and at the same time, perhaps, of that singular monarch's usual mode of speech. It must be understood, by way of prefatory illustration, that King James, who was the author of the earl's popular appellation, "*Tam o' the Cowgate*," had a custom of bestowing such ridiculous *sobriquets* on his principal councillors and courtiers. Thus he conferred upon that grave and sagacious statesman, John Earl of Marr, the nickname *Jock o' the Sklates*—probably in allusion to some circumstance which occurred in their young days, when they were the fellow-pupils of Buchanan. On hearing of an alliance between the Haddington and the Marr families, his majesty exclaimed, betwixt jest and earnest, "the Lord haud a grup o' me! if Tam o' the Cowgate's son marry Jock o' the Sklates daughter, what will come o' me?" The good-natured monarch probably apprehended that so close a union betwixt two of his most subtle statesmen might make them too much for their master—as hounds are most dangerous when they hunt in couples.

The Earl of Haddington died in 1637, full of years and honours. At Tynningham,† the seat of his descendant, the present earl, there are two portraits of his lordship, one a half length, the other a head. Both have the same costume, namely, the gown of the keeper of the Privy Seal, of black satin, twisted with gold, a ruff, &c. The face represents a man of sixty-four and upwards, with a very short crop of hair, which, originally light-coloured or reddish, has become grey through age. His features are thin and sharp, expressive of peculiar acuteness; the forehead narrow, tall, and wrinkled; while the dark hazel hue of his "partridge-eye" quite justifies the Highlander's expression. At Tynningham is also preserved his state dress; and it is a circumstance too characteristic to be overlooked, that in the crimson velvet breeches there are no fewer than *nine pockets*! Among many of the earl's papers which remain in Tynningham House, one contains a memorandum, conveying a curious idea of the way in which public and political affairs were then managed in Scotland. The paper contains the heads of a petition in his own hand writing to the Privy Council; and at the end is a note "to gar the Chancellor" do something else in his behalf.

The cynical Scotstarvit, who could find throughout the continued sunshine of the earl's prosperity, scarcely a single shade whereon to exercise his malicious pencil, records with his usual satisfaction, that, if his lordship was fortunate till the day of his death, at least his children were involved in disasters and poverty. This seems to have been fully as much, however, the result of accident and the troubles of the civil war, as of any degeneracy in point of personal talent or virtue. The second earl (Thomas) joined the Covenanters, and was made colonel of one of their regiments. In 1640, when stationed at Duglass Castle, in East-Lothian, in order to watch the motions of the garrison of Berwick, he met his death in the following singular manner.—His lordship had for his page an English boy, named Edward Paris, whose temper he had the misfortune to exasperate one day, by telling him jestingly before company that his countrymen were a pack of cowards, for having suffered themselves to be beaten, and run away, at Newburn. The boy resolved upon revenging this insult in the most decisive manner, and

that not only upon the author of it, but also upon those who had witnessed and partaken in it. Sir James Balfour says, that Paris was entrusted with the key of the powder vault, and that Lord Haddington reposed so much confidence in the youth, that he considered no other individual of his company so worthy of this important charge. He paid dearly for his jest, and for this misplaced confidence. On Sunday the 30th of August, at noon, as the earl and many of his officers and vassals were standing in the courtyard of the castle, the page went down to the vault, and, with the utmost deliberation, thrust a hot iron into one of the powder barrels, which instantly exploding, blew the principal building of the castle into the air, with all the people in it, and threw down the side-walls of the court upon the unfortunate Earl and his attendants. Lord Haddington, with his brother and other kinsmen, all the tenants, it is said, of the estate of Tynningham, about thirty gentlemen, a great number of soldiers, and not fewer than fifty-four male and female servants, perished in this dreadful calamity, together with the wretched page himself, of whose body no part was ever found, except an arm, the hand of which still grasped the iron spoon with which it had kindled the barrel! While the surviving children of Tam o' the Cowgate shared in the misfortunes of the time, or dilapidated their patrimonies by what Sir John Scott calls their riotous style of living, the line of the family was carried on by a series of luckless representatives, in whose hands the immense estates acquired by their sagacious ancestor rapidly disappeared. The eldest son of the second earl died before he came of age, after having made an imprudent match with a beautiful and accomplished, but profligate Frenchwoman, who in little more than six months of married life involved his estates in such debts as were not fully paid by his successors in twice as many years.* Other minorities succeeded, and were attended in those disastrous times with effects the very reverse of those which are now so favourable to infantine heirs. The languishing talent and impaired wealth of the family were, however, at length revived by an alliance with that of the celebrated Chancellor, the Duke of Rothes; from which proceeded two successive generations of poets, and other *ignes minores*,† whose spirited characters reflected back credit on the name of their distinguished ancestor. It is needless to remind the reader that another century has not seen this second flame exhibit symptoms of decay.

To all that has been said respecting the philosopher of the Cowgate, we may add, that, though his land-buying propensities were such and so well known that every body who wished to reduce their "dirty acres" to the pleasant form of cash, thought of applying to nobody but him, yet he does not seem to have ever felt a desire of living in a house of his own property. What makes the circumstance of his continuing to *rent* the house in the Cowgate the more remarkable, is, that the son of his landlord, Macgill, was "in a *selling way*" long before the decease of the Earl of Haddington. We can only account for this seeming inconsistency, by supposing that the earl had got an exceedingly long and exceedingly cheap lease of the house when he first inhabited it, and found the rent which he paid for it to be less than the interest or yearly value of its purchase money. That the rent was very moderate, is proved by a circumstance still remembered in the family, namely, that he also rented a tenement on the opposite side of the Cowgate, which he occupied as a coach-house and stables, and the rent of which, though perhaps little enough, caused him to complain, not without some show of reason, that he paid more for his stables than for his house!

THE FRENCH VILLAGE,

AN AMERICAN DESCRIPTIVE TALE.

On the borders of the Mississippi may be seen the remains of an old French village, which once boasted a numerous population of as happy and as thoughtless souls as ever danced to a violin. If content is wealth, as philosophers would fain persuade us, they were opulent; but they would have been reckoned miserably poor by those who estimate worldly riches by the more popular standard. Their houses were scattered in disorder, like the tents of a wandering tribe, along the margin of a deep bayou, and not far from its confluence with the river, between which and the town was a strip of rich alluvion, covered with a gigantic growth of forest trees. Beyond the bayou was a swamp, which, during the summer heats, was nearly dry, but in the rainy season presented a vast lake of several miles in extent. The whole of this morass was thickly set with cypresses, whose interwoven branches and close foliage excluded the sun, and rendered this as gloomy a spot as the most melancholy poet ever dreamt of. And yet it was not tenanted—and there were seasons when its dark recesses were enlivened by notes peculiar to itself. Here the young Indian, not yet entrusted to wield the tomahawk, might be seen paddling his light canoe among the tall weeds, darting his arrows at the parroquets, that chattered among the

* This lady (Henrietta de Coligny, great granddaughter of the celebrated Admiral Coligny) afterwards married a Huguenot Count, from whom she speedily got herself separated; and as she turned Catholic immediately after, Christina, Queen of Sweden, took occasion to say that her apostasy was owing to her hatred to her husband, for she had desired never again to meet him either in this world or the next.

† One of these was a *tuken magnum*, the late Lord Hailes, whose mother was the sister of the amiable, witty, and unfortunate Lord Binning.

* The story is thus told in a somewhat amplified manner by Mr Tytler, from the original anecdote in Forbes's *Scotsman*.

† The earl rented, from Macgill of Rankellor, that fine old house, or rather palace, which latterly went under the name of Merchants' Court, and has recently been removed to make way for one of the new bridges giving access to the Old Town.

† The old earl had a watch-tower at the top of his house, where he used to sit whole days (when not better employed) making observations of the proceedings of his labourers and work people out of doors.

boughs, and screaming and laughing with delight, as he stripped their gaudy plumage. Here myriads of mosquitoes filled the air with an incessant hum; and thousands of frogs attuned their voices in harmonious concert, as if endeavouring to rival the sprightly fiddles of their neighbours; and the owl, peeping out from the hollow of a blasted tree, screeched forth his wailing note, as if moved by the terrific energy of grief. From this gloomy spot, clouds of miasm rolled over the village, spreading volumes of bile and fever abroad upon the land; and sometimes countless multitudes of mosquitoes, issuing from the humid desert, assailed the devoted village with inconceivable fury, threatening to draw from its inhabitants every drop of French blood which yet circulated in their veins. But these evils by no means dismayed, or even interrupted, the gaiety of this happy people. When the mosquitoes came, the monsieurs lighted their pipes, and kept up not only a brisk fire, but a dense smoke against the assailants; and when the fever threatened, the priest, who was also the doctor, flourished his lancet—the fiddler flourished his bow—and the happy villagers flourished their heels, and sang, and laughed, and fairly cheated death, disease, and the doctor, of patient and of prey.

Beyond the town, on the other side, was an extensive prairie—a vast unbroken plain of rich green, embellished with numerous flowers of every tint, and whose beautiful surface presented no other variety than here and there a huge mound—the venerable monument of departed ages—or a solitary tree of stunted growth, shattered by the blast, and pining alone in the gay desert. The prospect was bounded by a range of tall bluffs, which overlooked the prairie, covered at some points with groves of timber, and at others exhibiting their naked sides, or high, bold peaks, to the eye of the beholder. Herds of deer might be seen here at sunrise, slyly retiring to their coverts, after rioting away the night on the rich pasturage. Here the lowing kine lived, if not in clover, at least in something equally nutritious; and here might be seen immense droves of French ponies roaming untamed, the common stock of the village, ready to be reduced to servitude by any lady or gentleman who chose to take the trouble.

This little colony was composed partly of emigrants from France, and partly of natives—not Indians, but *bona fide* French, born in America, but preserving their language, their manners, and their agility in dancing, although several generations had passed away since their first settlement. Here they lived perfectly happy; and well they might; for they enjoyed, to the full extent, those three blessings on which our declaration of independence has laid so much stress—life, liberty, and the pursuit of happiness.

If this village had no other recommendation, it is endeared to my recollection as the birth-place and residence of Monsieur Baptiste Menou, who was one of its principal inhabitants when I first visited it. He was a bachelor of forty, a tall, lank, hard-featured personage, as straight as a ramrod, and almost as thin, with stiff black hair, sunken cheeks, and a complexion a tinge darker than that of the aborigines. His person was remarkably erect, his countenance grave, his gait deliberate; and when to all this he added an enormous pair of sable whiskers, it will be admitted that Monsieur Baptiste was no insignificant person. He had many estimable qualities of mind and body, which endeared him to his friends, whose respect was increased by the fact of his having been a soldier and a traveller.

Across the street, immediately opposite to Mons. Baptiste, lived Mademoiselle Jeanette Duval, a lady who resembled him in some respects, but, in many others, was his very antipode. Like him, she was cheerful and happy, and single; but, unlike him, she was brisk, and fat, and plump. Monsieur was the very pink of gravity; Mademoiselle was blessed with a goodly portion thereof—but her's was specific gravity. Her hair was dark, but her heart was light; and her eyes, though black, were as brilliant a pair of orbs as ever beamed upon the dreary solitude of a bachelor's heart. Jeanette's heels were as light as her heart, and her tongue as active as her heels: so that, notwithstanding her rotundity, she was as brisk a Frenchwoman as ever frisked through the mazes of a cotillion. To sum up her perfections, her complexion was of a darker olive than the genial sun of France confers on her brunettes; and her skin was as smooth and shining as polished mahogany. Her whole household consisted of herself and a female negro servant. A spacious garden, which surrounded her house, a pony, and a herd of cattle, constituted, in addition to her personal charms, all the wealth of this amiable spinster. But with these she was rich, as they supplied her table, without adding much to her cares.

Baptiste and Jeanette were the best of neighbours. He always rose at the dawn, and after lighting his pipe, sallied forth into the open air, where Jeanette usually made her appearance at the same time; for there was an emulation, of long standing, between them, which should be the earliest riser.

"Bon jour! Mam'selle Jeanette," was his daily salutation.

"Ah! bon jour! bon jour! Monsieur Menou," was her daily reply.

Then, as he gradually approximated the little paling which surrounded her door, he hoped Mam'selle was well this morning, and she reiterated the kind inquiry, but with increased emphasis. Then Monsieur in-

quired after Mam'selle's pony, and Mam'selle's cow, and her garden, and every thing appertaining to her, real, personal, and mixed; and she displayed a corresponding interest in all concerns of her kind neighbour. These discussions were mutually beneficial. If Mam'selle's cattle ailed, or if her pony was guilty of any impropriety, who so able to advise her as Mons. Baptiste?—and if his plants drooped or his poultry died, who so skilful in such matters, as Mam'selle Jeanette? Sometimes Baptiste forgot his pipe, in the superior interest of the *tête-à-tête*, and must needs step in to light it at Jeanette's fire, which caused the gossips of the village to say that he purposely let his pipe go out, in order that he might himself go in. But he denied this: and indeed, before offering to enter the dwelling of Mam'selle on such occasions, he usually solicited permission to light his pipe at Jeanette's sparkling eyes—a compliment at which, although it had been repeated some scores of times, Mam'selle never failed to laugh and curtsy, with great good humour and good breeding.

It cannot be supposed that a bachelor of so much discernment could long remain insensible to the galaxy of charms which centred in the person of Mam'selle Jeanette; and, accordingly, it was currently reported that a courtship of some ten years' standing had been slyly conducted on his part, and as cunningly eluded on hers. It was not averred that Baptiste had actually gone the fearful length of offering his hand, or that Jeanette had been so imprudent as to discourage, far less reject, a lover of such respectable pretensions. But there was thought to exist a strong hankering on the part of the gentleman, which the lady managed so skilfully as to keep his mind in a kind of equilibrium, like that of the patient animal between the two bundles of hay; so that he would sometimes halt in the street, midway between the two cottages, and cast furtive glances, first at the one and then at the other, as if weighing the balance of comfort; while the increased volume of smoke which issued from his mouth seemed to argue that the fire of his love had other fuel than tobacco, and was literally consuming the inward man.

Such was the situation of affairs when I first visited this village, about the time of the cession of Louisiana to the United States. The news of that event had just reached this sequestered spot, and was but indifferently relished. Independently of the national attachment which all men feel, and the French so justly, the inhabitants of this region had reason to prefer to all others the government which had afforded them protection, without constraining their freedom, or subjecting them to any burdens; and with the kindest feelings towards the Americans, they would willingly have dispensed with any nearer connection than that which already existed. They, however, said little on the subject; and that little was expressive of their cheerful acquiescence in the honour done them by the American people in buying the country, which the emperor had done them the honour to sell.

I remained several weeks at this hospitable village. Few evenings passed without a dance, at which all were assembled, young and old; the mothers vying in agility with their daughters, and the old men setting examples of gallantry to the young. I accompanied their young men to the Indian towns, and was hospitably entertained. I followed them to the chase, and witnessed the fall of many a noble buck. In their light canoes, I glided over the turbid waters of the Mississippi, or through the labyrinths of the morass, in pursuit of water-fowl. I visited the mounds where the bones of thousands of warriors were mouldering, overgrown with prairie violets, and thousands of nameless flowers. I saw the moccasin snake basking in the sun, the elk feeding on the prairie; and returned to mingle in the amusements of a circle, where, if there was not Parisian elegance, there was more than Parisian cordiality.

Several years passed away before I again visited this country. The jurisdiction of the American government was now extended over this immense region, and its beneficial effects were beginning to be widely disseminated. The roads were crowded with the teams and herds and families of emigrants hastening to the land of promise. Steam-boats navigated every stream, the axe was heard in every forest, and the plough broke the sod whose verdure had covered the prairie for ages.

It was sunset when I reached the margin of the prairie on which the village is situated. My horse, wearied with a long day's travel, sprang forward with new vigour when his hoof struck the smooth firm road which led across the plain. It was a narrow path, winding among the tall grass, now tinged with the mellow hues of autumn. I gazed with delight over the beautiful surface. The mounds and the solitary trees were there, just as I had left them, and they were familiar to my eye as the objects of yesterday. It was eight miles across the prairie, and I had not passed half the distance when night set in. I strained my eyes to catch a glimpse of the village, but two large mounds and a clump of trees which intervened defeated my purpose. I thought of Gabrielle, and Jeanette, and Baptiste, and the priest—the fiddlers, dances, and French ponies; and fancied every minute an hour, and every foot a mile, which separated me from scenes and persons so deeply impressed on my imagination.

At length I passed the mounds, and beheld the lights twinkling in the village, now about two miles off, like

a brilliant constellation in the horizon. The lights seemed very numerous—I thought they moved; and at last discovered that they were rapidly passing about. "What can be going on in the village?" thought I—then a strain of music met my ear. "They are going to dance," said I, striking my spurs into my jaded nag, "and I shall see all my friends together." But as I drew near, a volume of sounds burst upon me, such as defied all conjecture. Fiddles, flutes, and tambourines, drums, cow-horns, tin trumpets, and kettles, mingled their discordant notes with a strange accompaniment of laughter, shouts, and singing. This singular concert proceeded from a mob of men and boys, who paraded through the streets preceded by one who blew an immense tin horn, and ever and anon they shouted, to which the mob responded. I now recollected to have heard of a custom which prevails among the American French, of serenading at marriages; and I rode towards the crowd, who had halted before a well-known door, to ascertain who were the happy parties, and soon learned that they were Monsieur Baptiste Menou and Mam'selle Jeanette Duval, of whom I have already spoken.

The door of the little cabin, whose hospitable threshold I had so often crossed, now opened, and Baptiste made his appearance—the identical, sallow, erect personage with whom I had parted several years before, with the same pipe in his mouth. His visage was as long and as melancholy as ever, except that there was a slight tinge of triumph in its expression, and a bashful casting down of the eye; reminding one of a conqueror proud but modest in his glory. He gazed with an embarrassed air at the serenaders, bowing repeatedly, as if conscious that he was the hero of the night.

I retired to my former quarters, at the house of an old settler—a little, shrivelled, facetious Frenchman, whom I found in his red flannel nightcap, smoking his pipe, and seated, like Jupiter, in the midst of clouds of his own creating, talking of merry doings in the village.

Upon after inquiry, I found that many causes of discontent had combined to embitter the lot of my simple-hearted friends. Their ancient allies, the Indians, had sold their hunting grounds, and their removal deprived the village of its only branch of commerce. Surveyors were busily employed in measuring off the whole country, with the avowed intention on the part of the government of converting into private property those beautiful regions which had heretofore been free to all who trod the soil, or breathed the air. Portions of it were already thus occupied. Farms and villages were spreading over the country with alarming rapidity, deforming the face of nature, and scaring the elk and the buffalo from their long frequented ranges. Yankees and Kentuckians were pouring in, bringing with them the selfish distinctions and destructive spirit of society. Settlements were planted in the immediate vicinity of the village, and the ancient heritage of the ponies was invaded by the ignoble beasts of the interlopers.

From that time the village began to depopulate. Some of its inhabitants followed the footsteps of the Indians, and continue to this day to trade between them and the whites, forming a kind of link between civilised and savage men. A larger portion, headed by the priest, floated down the Mississippi, to seek congenial society among the sugar plantations of their countrymen in the south. They found a pleasant spot on the margin of a large bayou, whose placid stream was enlivened by droves of alligators, sporting their innocent gambols on its surface. Swamps, extending in every direction, protected them from farther intrusion. Here a new village arose, and a young generation of French was born, as happy and as careless as that which is passing away.

Baptiste alone adhered to the soil of his fathers, and Jeanette, in obedience to her marriage vow, cleaved to Baptiste. He sometimes talked of following his clan; but when the hour came, he could never summon fortitude to pull up his stakes. He had passed so many happy years of single blessedness in his own cabin, and had been so long accustomed to view that of Jeanette with a wistful eye, that they had become necessary to his happiness. Like other idle bachelors, he had had his day-dreams, pointing to future enjoyment. He had been for years planning the junction of his domains with those of his fair neighbour; had arranged how the fences were to intersect, the fields to be enlarged, and the whole to be managed by the thrifty economy of his partner. All these plans were now about to be realised; and he wisely concluded that he could smoke his pipe and talk to Jeanette as comfortably here as elsewhere; and as he had not danced for many years, and Jeanette was growing rather too corpulent for that exercise, he reasoned that even the deprivation of the fiddlers and king-balls could be borne. Jeanette loved comfort too; but having besides a sharp eye for the main chance, was governed by a deeper policy. By a prudent appropriation of her own savings and those of her husband, she purchased from the emigrants many of the fairest acres in the village, and thus secured an ample property.

A large log-house has since been erected in the space between the cottages of Baptiste and Jeanette, which form wings to the main building, and are carefully preserved in remembrance of old times. All the neighbouring houses have fallen down, and a few heaps of rubbish, surrounded by corn fields, show

where they stood. All is changed, except the two proprietors, who live here in ease and plenty, exhibiting, in their old age, the same amiable character which in early life won for them the respect and love of their neighbours, and of each other.

POLAND IN 1830.

THE following statistical notices of that most unfortunate country, Poland, as drawn up by Dr B. Zaydler, a Polish writer, and which appeared in a recent Italian journal, cannot fail to be perused with interest at the present time:—

“The kingdom of Poland is divided into the following palatinates—Masovia, Cracow, Sandomer, Kalisz, Lublin, Plotsk, and Augustowa. The population, according to the last census in 1829, was (exclusive of the army) 4,088,290, which may be thus classed:—

<i>By their several races—</i>	
The real Poles,	3,000,000
Rusini, or Rusnicks, from the eastern parts of ancient Poland,	100,000
Lithuanians,	200,000
Germans,	300,000
Jews,	400,000
	4,000,000
<i>By their religion—</i>	
Roman Catholics,	3,400,000
Greek Church,	100,000
Lutherans,	150,000
Calvinists,	5,000
Jews,	400,000
Other sects,	5,000
	4,060,000

The population of the towns is to that of the country as one to five.

Employed in agriculture, there are householders,	1,871,259
Their families and servants,	2,221,183
Manufacturers,	140,377
Their families,	358,035
Tradesmen,	49,983
Their families,	131,331
Landed proprietors,	4,205
Copyholders,	1,886
Freeholders in towns,	41,654
Persons employed under government,	8,414
Patients in 602 public hospitals,	5,376
Prisoners in the 76 prisons,	7,926

The proportion between the nobles and the plebeians is as one to thirteen. According to a verification made by the senate in 1824, there were in the kingdom twelve princes, seventy-four counts, and twenty barons, besides the inferior or untitled nobility.

The city of Warsaw reckoned, in 1815, only 80,000 inhabitants; it now amounts to 140,000, besides the garrison. The provincial towns are, Lublin, having 13,400; Kalisz, 12,100; Plotsk, 9200, &c. The population of the kingdom has been increasing since 1815, at the rate of 100,000 individuals every year. It appears from Dr Rodecki's statistical tables, published at Warsaw in 1830, that there are Jews in almost every town in the kingdom of Poland; that in fourteen of these their number is equal to that of the Christians, while in one hundred and fourteen it is greater; in three the inhabitants are either all Jews, or almost entirely so. In Warsaw alone they muster 30,000. Their number is fast increasing. They monopolise almost all trade, to the exclusion of the Christian population. The government has endeavoured to check this evil, but with little success; and with this view Professor Chiarini has been employed in translating the Talmud, and in laying down a plan of reform for this singular people. The Catholic religion being that of the great majority of the kingdom, is under the special protection of the government, without infringing, however, on the public freedom of other forms of worship, and on the equality of individuals of every communion in the enjoyment of civil rights. The Catholic hierarchy consists of the archbishop of Warsaw, primate of the kingdom, and eight bishops, one for each palatinate. There are 1633 parish churches, one hundred and seventeen auxiliary ones, six colleges, eleven seminaries, one hundred and fifty-one male convents, and twenty-nine female. In 1819, Pope Pius VII. suppressed, by a bull, thirty-one male convents, and thirteen female. The number of the clergy of the Latin Catholic church is 2740. The Greek Catholics have a bishop at Chelm, 287 parish churches, one seminary, and five male convents. Their priests amount to 354. There are besides six churches of the Russo-Greek communion, under the jurisdiction of the bishop of Minsk, twenty-nine Lutheran, and nine Calvinist churches, having their respective consistories, two of the sect of Philipines, 274 synagogues, and two Mahomedan mosques, with their imams.

The university of Warsaw was founded in 1816, in lieu of that of Cracow, and it consists of five faculties, having 48 professors, and about 750 students. There are, besides, at Warsaw four lyceums, besides other schools, Sunday schools for mechanics, and girls' schools. In the provinces are 11 palatine schools, and 14 district ones. In all the kingdom there are 1756 professors, or teachers, nearly 30,000 students, and about 11,000 female pupils. In all chief towns of palatinates, there are civil and criminal courts, besides commissioners of the peace in every district. The two courts of appeal and the supreme court assemble at Warsaw. The senate takes cognisance of offences against the state. There are also a court of commerce and a territorial court.

The army consisted, in 1830, of eight regiments of infantry of the line, besides the guards; four regiments of light infantry; eight regiments of cavalry, besides the yagers of the guard; two brigades of foot artillery,

and two ditto of horse; a corps of engineers, &c.; in all, 36,000 men. The arsenal and foundry are at Warsaw. There are two fortresses in the kingdom, Zamosk and Modlin. Every individual from 20 to 30 years of age is subject to military service, except in cases of exemption provided by the law. The two new military schools, formed in 1825, near Warsaw, have educated already nearly 7000 pupils.

In 1827, the national receipt was 71,988,102 florins, and the expenditure was 69,016,030 florins; the Polish florin is about 6d. sterling.

There are in the kingdom, especially about Keilce, mines of iron, zinc, coals, and also copper and lead. Of 451 towns in the kingdom, 353 consist more than half of wooden houses; 83 are entirely of wood; 6 have half their houses made of brick; and 9 consist of more brick than wooden houses. Warsaw contains 1540 brick, and 1421 wooden houses. Besides the towns—of which 214 are national property, and 237 belong to private families—there are in the kingdom 22,365 villages, 5373 of which are national property, and 16,992 private property. The communications have been extensively improved since 1815. Two fine substantial roads cross the whole kingdom, one from Kalisz to Brzesk Litewski, another from Cracow to the Niemen, both passing through Warsaw. Diligences have been established; inns and post-houses erected; 523 bridges have been constructed or repaired. Embankments, in great part of stone, have been raised to restrain the waters of the Vistula. The other rivers have been cleansed, and a canal has been cut to join the Narva to the Niemen.

The city of Warsaw has wonderfully improved since the peace. New streets, squares, palaces, gardens, private and public buildings, have been constructed either by government or by individuals, assisted, in many instances, by the public treasury. The streets are well lighted; several of them have been macadamised. The management of prisons has been ameliorated, and convicts are employed in the public works; mendicity is suppressed. A society of beneficence has been formed at Warsaw, as well as a society of the friends of science. A new exchange, a new theatre, the new church of St Alexander, new barracks and a monument to Copernicus, by Thorwaldsen, have been raised.

The exports of the kingdom consist chiefly in corn and cattle, besides honey, wax, timber, wool, hides, and tallow. The imports are wines, tobacco, colonial produce, and articles of luxury and fashion. The manufactures of woollen cloth, linen, carpets, and leather, have thriven since the peace. While in 1815 there were hardly one hundred looms for coarse woollen cloths, there are now above six thousand, which now supply the whole kingdom, including the army. More than ten thousand families of foreign workmen, chiefly German and Swiss, have expatriated to Poland, where they have built new towns, and peopled districts formerly deserted. There are numerous distilleries of spirits, and the brewing trade is very extensive; they brew porter and ale equal to those of England. By the former laws of Poland, commerce was depressed, and no noble, however poor, could, without degradation, resort to it, whilst he often served in a menial capacity a richer nobleman.

Agriculture, which is still the principal occupation of the population, suffers under a depression of prices. In 1827, they reaped 4,439,399 *korsees* (a *korsee* is nearly two hundredweight) of rye, 3,183,023 of oats, 1,506,062 of barley, and 751,076 of wheat, besides 4,288,185 *korsees* of potatoes and hay, flax, hemp, and honey. The cattle are improving both in quantity and quality.

In 1827, there were in the kingdom 694,728 cows, 475,946 oxen, 259,990 calves, 703,207 pigs, about two millions and a half sheep, 192,841 horses, 8771 stallions, 167,901 mares. About one-half the extent of the territory of the kingdom may be reckoned to be cultivated, one-fourth of the remainder is occupied by forests, and the rest by marshes and uncultivated lands. Since the establishment of the grand duchy of Warsaw, the peasantry of that part of Poland have been emancipated; they live on the estates of the great landlords, each family having a cabin and thirteen acres of ground, on condition of working for the owner three days in a week. They may remove themselves by giving up their tenements. Several proprietors have adopted the system of free labour and wages.”

ANECDOTE.

The following anecdote is extracted from a Belgian journal:—“An individual at Antwerp lately gave a supper to forty poor hunchbacks! He awarded a premium of sixty florins to him whose hunch was the most prominent, and who was also proclaimed king of the feast. Carriages were sent to bring the guests from their residences, and to take them back again when the festivities were concluded. They enjoyed the dance till a late hour in the night, and returned home highly gratified with the kindness and generosity of their landlord.”

LADY STAIR'S FUN.

Graham of Claverhouse (commonly pronounced Clavers) was appointed sheriff of Wigtownshire in 1682. On one occasion, when this violent persecutor had been inveighing in Lady Stair's presence against our illustrious reformer, she said, “Why are you so severe on the character of John Knox? You are both reformers; he gained his point by *clavers*; you attempt to gain yours by *knocks*!”

JAMAICA—SLAVES.

JAMAICA is the most considerable, as well as by far the most valuable, of the British West India islands. It is situated among the group of islands called the Greater Antilles; extends 140 miles in length by 50 in breadth, at its widest part; has the island of St Domingo on the east, and from which it is separated by a channel; Cuba on the north; the Bay of Honduras on the west; and South America on the south. It lies in 18° 12' of north latitude. The climate is temperate, the medium heat at Kingston, throughout the year, being 80°, and the least 70°, which is much about the same as the hottest summers in Scotland. The air, however, is much colder in the high grounds. The island is crossed longitudinally by an elevated ridge, called the Blue Mountains, and one of the peaks rises to a height of 7431 feet above the level of the sea. Jamaica is one of the most beautiful and fruitful countries in the world, and may be styled the Emerald of the Ocean. Though discovered by Columbus in the year 1494, and settled by the Spaniards in 1509, since which period it has been gradually undergoing improvements, especially since it was conquered by the English, in 1655, it still exhibits all the wild luxuriance and natural character of a forest. Its extensive woods of mahogany, and other large trees, cover a vast portion of its territory, and are interspersed with beautiful verdant glades, or savannahs, while the trees and shrubbery spread to the very peaks of the mountains. On the north of the island, at a small distance from the sea, the land rises in small round topped hills, which are covered with spontaneous groves of pimento; under the shade of these is a beautiful and rich turf. This side of the island is also well watered, every valley having its rivulet, many of which tumble from overhanging cliffs into the sea. The back ground in this prospect, consisting of a vast amphitheatre of forests, melting gradually into the distant Blue Mountains, is very striking. On the south coast, the face of the country is different; it is more sublime, but not so pleasing. The mountains here approach the sea in immense ridges; but there are even here cultivated spots on the sides of the hills, and in many parts vast savannahs covered with sugar-canes, stretching from the sea to the foot of the mountains. The soil of the island of Jamaica is in many places deep and fertile. The island has upwards of a hundred rivers, but from the rapidity of their current, and the roughness of their channel, they are navigable only by canoes. Besides the staple exports of Jamaica, consisting of sugar, indigo, coffee, and cotton, the cultivated vegetables are maize, Guinea corn, and nutritious vegetables of different kinds, for the food of the negroes. The chief indigenous fruit is the plantain cocoa-nut. Jamaica is divided into three counties—Middlesex, Surrey, and Cornwall. The county of Middlesex is divided into eight parishes, Surrey into seven, and Cornwall into five. In Middlesex is situated St Iago or Spanish Town, the capital of the island. Port Town is a considerable town and seaport, situated in Surrey. The other chief towns in the island are Port Antonio and Montego Bay Town. There are a great number of villages and inferior seaports. The cultivation of the land in Jamaica is carried on by means of negro slaves, male and female, the greater part of whom are natives of the island, or the immediate descendants of slaves imported from Africa. [An exact account of the number and character of the population will be given in a subsequent paper.] It has been generally acknowledged by intelligent travellers that the slave population of Jamaica has been under a more mild species of treatment than in some other Indian possessions. Indeed, if we could divest our minds of the natural repugnance we feel with regard to every thing like the slavery of human beings, or look coolly on slavery as it exists, instead of reasoning upon it on abstract principles, we would at once arrive at the conclusion that the slaves of Jamaica have for some time been in the enjoyment of far greater physical comforts than are to be found among the peasantry of England and Ireland. From the evidence of every writer on the subject, and from the best living testimony, it appears that the cottage of a West Indian slave is beyond measure superior to an Irish or Scottish cabin among the poorer classes. Leaving my readers, however, to form their own judgment on this momentous question, upon which it is unnecessary for me to express an opinion, I may for their amusement present the following short description of a slave's hut in Jamaica, as afforded by a recent traveller:—

“The house is about forty feet long, and almost eighteen wide; built of boards, and covered with fan palms; divided into five apartments, of which the principal is eighteen feet square. This is the hall; the other apartments lead from it, three serving for sleeping rooms, and the fourth for a sort of pantry. There is a door at each end of this hall through which the smoke escapes when it is necessary to boil the pot; at no other time is there occasion for fire. When I entered, I saw a negro woman squatting on the floor, attending the cookery of her husband's dinner, which was simmering in an iron pot, and consisted of ochro and cocoas, picked crabs, and salt fish, with a bit of salt pork. The lady was peeling a few plantains to roast, and the lord of the mansion was inhaling the fumes of tobacco from a short junks pipe, as he lolled at his ease in his hammock, suspended from one of the rafters to within two feet of the floor.

There was a substantial deal table in the hall, with four rush-bottomed chairs, and a wooden bench, over which hung a bunch of corn, and a matchet or cutlass; above these was a shelf with a range of white plates and a few glasses, and above these hung several pieces of salt fish, and a good bunch of plantains. There was a basket of yams near the table, as if just brought in, and on it a cocoa-nut shell with a handle, to ladle water or soup. Several tin pans hung from one of the beams, and among them a large net full of coconuts. There was an oil jar in one corner to hold water, and a hoe and billhook in another, besides a large gourd with a hole in it, which serves as a musical instrument, and is called a drum. There was likewise a gombay, and a bonja, which is much like a guitar, and several calabashes were ranged along the beams, containing sugar and coffee. I must not forget to mention three young children, fat and sleek as moles, that were playing about the house and garden, which contained plantain suckers, an alligator pear-tree, mangos, two or three cocoa-nut trees, orange trees, a few coffee bushes, and many other fruits and vegetables, and a pine-apple fence separated it from the adjoining garden. There was a pigstye in one corner, occupied by a sow and her family. This is a portrait of one of the inferior cottages, some of the best having piazzas, with terrace floors. Every garden has a pigstye, and the poultry roost at a little distance from the house."

PUBLIC MEETINGS.

It is seldom the case that foreigners who travel or reside but a short time in Great Britain, arrive at a just comprehension of the intricate, ill-defined, conventional arrangements of society in this country; and, in perusing the explanations which they offer in their published works on many of our institutions, we at once perceive and pity the errors into which, in nearly all cases, they can hardly prevent themselves from falling. The only foreigner in recent times who seems to have spoken accurately on our civil arrangements, was the late Baron de Staël, son of the baroness of that title. This young gentleman's "Letters on England" is one of the most interesting works of the kind ever written; and to show the style and conception of the author, the following candid article on Public Meetings may be presented:—

"A man of wit said, 'The language of despotism is, Mind your own concerns; that of liberty is, Attend to things that don't concern you.' In this pithy form he announced a grand truth. In a free country nothing that affects any class of citizens can be foreign to the rest of the community. There is not an Englishman, however humble the rank in which he was born, who is not justly entitled to think that his opinion is of some weight in the affairs of his country; and, reciprocally, there is no individual so exalted, as, for his daily conduct, to be exempt from the examination and judgment of the public.

With us, on the Continent, publicity is considered as an extreme resource, to which we have recourse only in desperate cases, and after having exhausted all other means of attaining our object. If persons engage in an undertaking of public or private concern, they always found their hopes of success on the disposition of men in power; business is conducted in the closet of the minister, or in the drawing-room of some man of weight. While there is any chance of succeeding through favour, it would appear rude or indiscreet to speak out, and call on the public to judge of our griefs or projects. In England, publicity is a matter of common right; men address themselves to the opinion of the public at once; this is the first power, the support of which they solicit; and even men desirous of treating with government would begin by seeking popularity, well knowing it would be for the interest of their ambition.

Is an abuse to be reformed—an improvement to be introduced—a right to be claimed—a new institution to be founded?—whether it concern religion, morality, liberty, or the public wealth, the first indispensable step is to enlighten public opinion on the point in question. The attempt to fix the public attention is begun by writing pamphlets, or paragraphs in the newspapers. Then a few people of note form a committee, and prepare a string of resolutions, which are submitted to general discussion. When agreed so far, a meeting is called, either in the open air, or in one of the large rooms adapted to the purpose, which are to be found in almost every large town in England. A chairman, called on by the public voice, presides over the meeting; the resolutions are discussed, and put to the vote; and, amid the most stormy debates, a certain familiarity with the forms of deliberation, common to all classes of the people, maintains order, and protects the rights of the minority.

Frequently, at these meetings, orators, before unknown, appear in public for the first time, and display talents that perhaps pave the way for their future admission to the senate. The next day their speeches are printed in all the newspapers, and resound throughout all England. The first meeting gives rise to others, men's minds are enlightened and warmed, and the public opinion acquires a degree of force, any resistance to which would be useless.

It is not without reason, therefore, that the English set so high a value on the right to assemble for the discussion of public affairs, and place it in the first rank of their constitutional prerogatives. The right

of petitioning, as they conceive it, is nothing but the right of meeting to deliberate on the requests or complaints expressed in the petition; for the houses of Parliament are not expected to decide, like judges, on every requisition addressed to it. Particular cognisance is taken of a petition, only when it is made the subject of a motion by some one of the members. The right of introducing a subject is not given indiscriminately to the public at large, which would be a confusion of power leading to anarchy. But what is justly required is, that the public opinion should enjoy the utmost latitude in forming and expressing itself.

In a country where every thing is treated publicly—where every thing is subjected to discussion, from the most important questions of legislation, to the slightest of local affairs—the talent of speaking must naturally be an object of universal ambition. At school, and even in their play, children exercise themselves in this species of eloquence. At Eton and Westminster, they frequently form a little House of Commons, subjected to regulations similar to those of the Parliament. When at the university, the young men unite in debating societies, where questions of history, philosophy, legislation, and political economy, are discussed in form. At these are frequently developed the germs of the greatest talents; and an orator, whose eloquence will some day be the pride of England, may have felt the first spark of his genius elicited by the applauses of his fellow-students.

The debating societies, however, are merely supplementary, and not essential parts of the system; but all the institutions that constitute the basis of the social order—as juries, managing committees, municipal councils, parochial and county meetings, and elections, presume habits of speaking, and a knowledge of the forms of deliberation. We scarcely find a man that has received any education, who does not know how to preside at a meeting, direct its debates, and put questions to the vote in due order. There are indispensable notions in respect to this, which are so familiar to the people of England, that no one would think of making them an object of study; while with us, they who have grown old in our deliberative assemblies still remain ignorant of them.

Written speeches, prohibited in Parliament by its rules, are equally so by custom in every other assembly. To speak in public, and to speak extempore, are synonymous terms; and the idea of carrying, ready drawn up in the pocket, the expression of sentiments that might arise from circumstances yet to come, or of an opinion that ought to be formed from a discussion not yet begun, would appear the extreme of ridiculousness. No one supposes a person can find it difficult to relate what he knows, or say what he thinks; whoever expresses himself with simplicity and modesty, obtains a favourable hearing, and the severity or the indulgence of the public is apportioned with remarkable justice to what it has a right to expect from the talents or condition of the individual.

Public dinners are one of the most common occasions of the exercise of oratory. The object of these dinners is to keep up the spirit of an association, or to encourage the study of some science, by bringing together persons who otherwise would have no opportunity of freely communicating to each other their ideas; or to keep alive political opinions, by celebrating the anniversary of an important event, the birth of a great man, or the election of a member of the House of Commons dear to his country. Nothing is more original than these political dinners. Many times I have seen nearly three hundred persons seated at the same table, and electrified by the same sentiment, without the vivacity of their emotions preventing them from observing with the most methodical regularity all the usages established on such occasions.

A chairman is seated at the head of the table. No meeting takes place without this formality, which seems indispensable for securing order and regularity in every kind of discussion. The English of all classes have a remarkable tact in this respect; and if a speaker deviate ever so little from the established rules of decorum, a cry of *Chair! Chair!* resounds on all sides. This is a kind of appeal to the abstract idea of a president, informing him who executes the functions of one, that he is expected to maintain order, or restore the due state of the question. At the other end of the table sits the *deputy-chairman*, whose business is to preside when the chairman himself is called upon to take part in the debate; for there are two invariable axioms—one, that the meeting must never be without a head; the other, that the person who is officiating as president cannot act as a party in the debate at the same time.

At the dessert, when the cloth is removed, according to the custom yet pretty general in England, a master of the ceremonies, standing behind the president's chair, with a glass in his hand, informs the company that the toasts are going to commence. It is usual to begin with the King—then the Duke of York and the army—then the Duke of Clarence and the navy—either with plaudits or in silence, according to the occasion or sentiments of the meeting. Then come the toasts appropriate to the occasion of the meeting, as the health of the member whose election is celebrated. 'Gentlemen, fill your glasses,' cries the master of the ceremonies; after which he gives three times three huzzas. These are repeated in a low voice by all the company; and it is only at

the ninth that the enthusiasm, even if it be at its height, allows itself to break out in shouts and plaudits. He whose health has been drunk then rises, stands up on his chair, or on the table itself, amid the plates and glasses, and there, after having returned thanks to the assembly, with an expression of humility sometimes much greater than is necessary, gives an account of his conduct, traces the history of his political life, or repeats, in a gayer and more striking form, the opinions he has delivered in Parliament."

Such are the judicious and accurately-formed opinions of this ingenious and lamented young foreigner, whose work has been rather overlooked, and which I can safely recommend to the perusal of my readers.

EMIGRATION.

"FRIDAY, 14th," continues Mr Fergusson, "my landlord at Guelph, having agreed to drive me in his waggon to Mr Dickson's, at Galt, a gentleman who purchased from government a whole township, and to whom I had particular introductions, we started about 11 o'clock, and reached our destination about four. The road was certainly superior to what I had travelled yesterday, though mud holes were occasionally to be met with. Limestone was to be seen on every hand in great abundance, and I observed at one place a kiln hewn out and erected in the very stratum itself. Wherever a clearing occurred, the wheat looked beautiful. We passed through the township of Waterloo, settled mostly by Dutch. The soil appeared to be a good, useful, sandy loam, well watered by streams and springs. I was delighted with the cultivation, especially upon the farms of Schneider and Warnex. Each farm might be from 200 to 300 acres, laid out into regular fields, and *not a stump to be seen*. The ploughing was capital, the crops most luxuriant, and the cattle, horses, &c., of a superior stamp, with handsome houses, barns, &c., and orchards promising a rich return. Waterloo satisfied me, above all that I had yet seen, of the capability of Canada to become a fruitful and fine country.

The forest around consists of heavy timber, and the township does not enjoy the advantage of a direct water-carriage; yet have these Dutchmen, within a period of 20 years, produced farms which, in general aspect, very nearly resemble well-cultivated land in Britain. The farmers are primitive and simple-minded, attending to little beyond their own affairs, and so indifferent in regard to politics, that Mr Dickson doubted much if some of them were yet aware of the death of George III. A great deal of capital flowed into this settlement during the large expenditure at Guelph by the Canada Company—the Dutchmen supplying teams, provisions, &c. My travelling companion valued some of the farms at 25 dollars, about £6, per acre.

Chopping or clearing land ready for sowing, will cost sometimes 12 dollars, or £3 per acre; the first return will be 15 or 20 bushels of wheat, worth at present 5s. per bushel. The usual mode of clearing timbered land is to cut down and burn all the wood of one foot diameter, and under that; the larger trees are only girdled. Clearing in this way costs about eight dollars, or 40s. per acre. When this is done, a crop of wheat can be harvested in, to be followed by two or three years of pasture or hay, when the plough may be used, and during which time the girdled trees are either cut into fencing stuff or burnt. No lime has been used, as yet, upon this land, and I was told of two instances where farmers had absolutely built new stables and barns, to escape from an accumulation of despoiled manure.

The settlement of Mr Dickson is one of much interest, being conducted by himself, on his own resources, in the same way as that of Colonel Talbot on the banks of Lake Erie. Mr Dickson began operations in 1815-16, by the purchase from government of this township, extending to 96,000 acres, and to which he gave the name of Dumfries. He selected a convenient spot, with good water-power, to commence a town, and formed a connection with an enterprising American, who speedily established very extensive mills. Mr Dickson built a commodious residence for himself, in a romantic situation overhanging the river, and communicating by a bridge with the mills and town. His plan of dealing with settlers is extremely liberal, as he does not insist upon any instalment being paid down, and even in some cases advances the means of purchasing oxen, &c. In this way the poorest emigrant, if steady and industrious, must get forward.

A regular account is opened with each individual, and partial payments, either in money or produce, accepted by Mr Dickson from time to time. The price of land is four dollars, or 20s. per acre. Farms have been occasionally abandoned by unsteady or impatient individuals; but some progress in clearing has always been made, and, of course, the farm has, in so far, been rendered more valuable. A very considerable extent of land has been disposed of on both sides of the river, and hundreds of acres of fine wheat may be seen contiguous to each other.

An attempt has been made last spring to convey produce down the river to the Welland Canal, by which Mr Shade, the owner of the mills, informed me a saving of two-thirds would be effected upon the transport of flour. This voyage was performed by a son of Mr Dickson, accompanied by Mr Shade; and being a navigation of about 100 miles, attended with some hazards, as a first attempt it created a good deal of sensation at the time of my visit, and much satis-

faction among the farmers by its success. Mr Dickson has about 2500 souls upon his estate, and draws a very handsome income from the interest of sales. I visited the mills with Mr Shade, who took much trouble in explaining to me the various machinery. The establishment comprises flour-mills, saw-mills, cooperage, &c., and appeared to me equally extensive and well-arranged. I have been every where struck with the havoc and destruction of the woods, and had a remarkable opportunity in this place of contrasting the value of a tree in Upper Canada with what it would have fetched at home. An uncommonly large and beautiful pine was lying at the mill, which I could not estimate at less than L.3 in Britain. Mr Shade, upon my putting the question, told me it had just cost him a *York shilling, or sevenpence sterling.*—*Agricultural Journal.*—To be continued.

ENCYCLOPÆDIA BRITANNICA, NEW EDITION.

AMONG the articles in the early volumes of the present work, there is one of a remarkably valuable character, on the subject of "Army," which is understood to be from the pen of James Browne, Esq. advocate, LL.D., author of a series of most profound and original articles on Egyptian Hieroglyphics, in the Edinburgh Review. The following appears to be one of the most interesting passages in this article, and relates, in brief terms, the strength of the French republican and imperial armies:—

"At the end of 1791, the French infantry consisted of 105 regiments, of two battalions each, 14 battalions of light troops, and 170 battalions of national volunteers; or 394 battalions in all. By the decree of May 5, 1792, the number of the volunteer battalions was raised to 200, and the strength of each was increased from 226 to 800 men. The cavalry was composed of two regiments of carabineers, consisting of four squadrons each; 24 regiments of heavy cavalry, of three squadrons each; 18 regiments of dragoons, of three squadrons each; 12 regiments of chasseurs, of four squadrons each; and 6 regiments of hussars, of three squadrons each; in all, 206 squadrons: so that the total strength of the French army at this period did not exceed 160,000 infantry, 35,000 cavalry, and 10,000 artillery; while 20,000 men were still wanting to bring the different regiments to their full complements. But this deficit was soon supplied by the multitude of volunteers who flocked to the national standards, when the Duke of Brunswick invaded France at the head of the Prussian army. The revolution, however, had not yet developed its energies, nor had the world as yet any suspicion of the prodigies which the system of terror, afterwards organised, was destined to achieve. In 1795, France presented the formidable aspect of a vast camp. The decrees of the 23d August and the 5th September 1794, had hurried the whole youth to the frontiers. Nearly 1,200,000 men were in the pay of the republic; and after deducting those employed in accessory services, and in the navy, the number of combatants in the field cannot have amounted to less than about 700,000. The official state of the force of the French armies, as at the 5th of April 1794, presents an aggregate of 794,334 men, including garrisons, but exclusive of the army of the interior, whose head-quarters were at Paris; which, allowing one-fifth for those in the depôts and for the sick, would give an effective force, present under arms, of at least 650,000 men; the most formidable which Europe had ever seen assembled in the field. Nor did the 'prodigy' stop here. In the month of March 1795, France had ten armies in the field, the active force of which amounted to 449,930 combatants, besides 120,850 in garrisons, and 338,450 sick, prisoners, or detached; in all, 959,190 soldiers. But the active force, or number present under arms, did not form the half of the effective, and scarcely a third of the complete military strength of France at that period; for, as 200,000 men were still wanting to bring the effective force up to the full establishment, and as the most active measures were in progress to make up the deficit, the total number of Frenchmen under arms in 1795 cannot have fallen much short of 1,100,000 men.

But this state of exertion was too violent to be of long continuance, and neither the population of the country, nor its exhausted resources, were sufficient to maintain so enormous a force in the field. Accordingly, in the succeeding years of the republic, the aggregate of the different armies seldom exceeded 480,000 effective men, and generally fell short of this number. But when Napoleon had mounted the throne, and had organised the system of conscription, he obtained an unlimited command over the whole of that part of the population capable of bearing arms; and as he acted upon the principle first recommended by Cato, of making the war support itself, he was not only able to repair the losses sustained in his various campaigns, but on most occasions to take the field with a predominating superiority of numbers. The establishment of the French army in 1805, amounted to 341,412 infantry of the line, 100,130 light infantry, 77,488 cavalry, 46,489 artillery, and 5445 engineers; making a total of 650,964 men, or a force equal to that organised by the terrorists in 1794 and 1795. But this establishment was afterwards greatly increased; and it is calculated that, at the time of the Russian campaign, there were in the depôts, in the hospital, and in the field, not less than 1,200,000 men, of whom about 350,000 might be considered as effective. Hence, we

are enabled to account for the extraordinary phenomenon of Napoleon's appearance in Germany at the head of a new and formidable army, within a few months after the annihilation of his veteran masses amidst the steppes, snows, and frosts of Russia, and making head for more than a year afterwards against the utmost efforts of the allied powers."

SOUTH AMERICAN PEASANTRY.

After doubling Cape Horn, or the southern extremity of the continent of America, and touching at Valparaiso, the Guerriere, says Stewart, proceeded to Callao, the port of Lima, the capital of Peru. Of those scenes which the author met in the ride between those two places, the following is a specimen:—"Such touches of the true grotesque as were occasionally presented, I have seldom before seen. Fancy to yourself a hundred mean-looking mules and donkeys in a single drove, as shaggy and as unsymmetrical in their whole outline as the ugliest you ever saw, bundled up and encased by all manner of things to a bulk twice the bigness of themselves, and then surmounted by objects in the human shape, old and young, male and female, black and white, Spaniards and Indians, in a variety of figure and garb, to which the pencil of a Cruikshank could scarcely do justice. The load of one of these animals, scarce three feet high, was not less than ten sheep, killed and dressed from the shambles. Six were tied two and two together by the hind legs, and then thrown across the back of the donkey from the shoulder-blade to the tail; one on either side, so as to balance each other, as their trunkless heads dangled almost on the ground; upon these the rest were lashed horizontally, forming a platform of the dead over the living beast, on which various other smaller articles of poultry were fastened, while on the top of the whole, at a very honourable elevation, on a dirty cushion, sat, *à la Turque*, a most villainous-looking old man, in a ragged poucho, with a slouched and greasy hat, and bare arms and legs. Beside him, on a similar Rosinante, rode his *cara sposa*, an equally interesting object both in figure and garb, seated in the same attitude on the top of pannier after pannier, and basket upon basket, of potatoes and beans, cabbages and onions, oranges, bananas, melons, tomatoes, &c., as if bearing to her customers specimens of the growth of a whole plantation. Entire families, in two or three instances, were seen on a single beast, seated from the neck to the tail, according to their ages, the younger children and females forward, and the men on the extremity of the back. In two instances I counted five persons thus mounted; two of whom in one case seemed each as well able to carry the donkey, as he the weight of either of them."

A FAITHFUL MESSENGER.

In the month of February of the very severe winter 1795, as Mr Bolstead's son, of Great Salkeld, in Cumberland, was looking after his father's sheep on Great Salkeld common, not far from Penrith, he had the misfortune to fall and break his leg. He was then three miles from home, and no person within call, and evening very fast approaching. Under the impulse arising from the desperate circumstances of his situation, he folded up one of his gloves in his handkerchief, tied this about the neck of his dog, and ordered him home. Dogs which are trained to an attendance on flocks are known to be under admirable subjection to their masters, and execute their orders with an intelligence scarcely to be conceived. The animal set off, and arriving at the house, scratched at the door for admittance. The parents were alarmed at his appearance, and concluding, upon taking off and unfolding the handkerchief, that some accident had undoubtedly befallen their son, they instantly set off in search of him. The dog needed no solicitation. Apparently sensible that the chief part of his duty was still to be performed, he led the way, and conducted the anxious parents directly to the spot where their son had fallen. The young man was taken home, and the necessary aid being procured, he was soon in a fair way of recovery; nor was he ever afterwards more pleasantly employed than when reciting this anecdote, so illustrative of the sagacity and fidelity of his constant companion.

WASHINGTON.

It has been observed that Washington seldom smiled, and never laughed. This, however, is not correct. I was informed the other day, by a gentleman venerable for his age and information, that he had seen Washington nearly convulsed with laughter. One instance he mentioned with a great degree of *sang froid*. At the time that our troops were encamped at Cambridge, information was received at head-quarters that the English were about leaving Boston to give them battle. All was bustle and confusion. The soldiers were strolling over the town, and the officers were but ill prepared for the approaching rencontre. Some of the generals were calling for their horses, and others for their arms; and, among the rest, was General Green, at the bottom of the stairs, bawling to the barber for his wig. "Bring my wig, you rascal! bring my wig!" General Lee diverted himself and the company at the expense of Green. "Your wig is behind the looking-glass, sir." At which Green, raising his eyes, perceived by the mirror that the wig was where it should be—on his head. Washington, in a fit of laughter, threw himself on the floor, and the whole group presented rather a ludicrous spectacle.—*New York paper.*

WINDHAM'S DISTASTE FOR MUSIC.

Though his taste for the fine arts was peculiarly pure and discriminating, he had no relish for music; but he acknowledged that a simple ballad, as Miss Alderson (afterwards Mrs Opie) sang it, he could endure with a degree of acquiescence almost amounting to pleasure. Yet, upon another occasion, when an interesting young lady was singing the old song of "Barbara Allan," and making a considerable pause between the stanzas, I observed Windham more than half asleep. His excuse was, that it was too long, and reminded him "of one of Mr Drake's speeches in the house, who made you believe twenty times that he was going to finish, but still went on." I have heard him observe, that the four greatest men he had ever known had no pleasure in music—Mr Burke, Charles Fox, Dr Johnson, and Mr Pitt. Sir James Mackintosh has the same apathy to music. He has been frequently dragged to the Italian Opera, and a more woful figure in the pit of that theatre was never seen. Richard Sharp proposed, as a thesis for the physiological schools of Edinburgh—What was the precise effect of music on the sensorium of Mac-Intosh?—*New Monthly Magazine.*

PLANTS IN BEDROOMS.

Persons who are fond of odiferous plants and flowers, should never permit them to be placed in their bed-chamber, as many of them are so powerful as to overcome the senses entirely. Even plants that are not in flower, and have no smell, yet injure the air during the night, and in absence of the sun, by impregnating it with nitrogen and carbonic acid gas; although in the daylight they rather improve the atmosphere by yielding oxygen gas.

GOOD-NATURED PASSIONATE PEOPLE.

It is a very common expression, that such an one is very good-natured, but very passionate. The expression, indeed, is very good-natured, to allow passionate people so much quarter. But I think a passionate man deserves the least indulgence of any. It is said, it is soon over; that is, all the mischief he does is quickly dispatched, which I think is no recommendation to favour. I have known one of these good-natured passionate men say, in a mixed company, even to his own wife or child, such things as the most inveterate enemies of his family would not have spoken, even in imagination. It is certain that quick sensibility is inseparable from a ready understanding; but why should not that good understanding call to itself all its force on such occasions, to master that sudden inclination to anger? To contain the spirit of anger is the worthiest discipline we can put ourselves to. When a man has made any progress in this way, a frivolous fellow in a passion is to him as contemptible as a froward child. It ought to be the study of every man for his own quiet and peace. When he stands combustible, and ready to flame upon every thing that he touches, life is as uneasy to himself as all about him. This is the most scandalous disuse of reason imaginable: all the harmless part of him is no more than that of a bull-dog—they are tame no longer than they are not offended.—*Addison.*

ABORIGINAL CHARACTER.

As an Indian was straying through a village on the Kennebec, he passed a gentleman standing at his store door, and begged a piece of tobacco. The person stepped back, and selected a generous piece, for which he received a gruff "thank you," and thought no more of the affair. Three or four months afterwards, he was surprised at an Indian coming into the store, and presenting him with a beautiful miniature birch canoe, painted, and furnished with paddles to correspond. On asking the meaning of it, he was told, "Indian no forget; you give me tobacco—me make this for you." This man's gratitude for a trifling favour had led him to bestow more labour on his present than would have purchased him many pounds of his favourite fumigatory.—*Boston paper.*

JAPAN.

It is well known that the Japanese will not hold any intercourse with Europeans, whom they treat like persons infected with the plague. Indeed, it is as much as their lives are worth to approach a foreigner. They are content and happy under the present order of things, and consider a jealous avoidance of all contact with strangers as the surest means to preserve their present state. When Captain Kotzebue visited the island, on his first voyage with Krusenstern, a seven months' residence justified him in asserting, that to know the Japanese was to esteem them—so high was the degree of rational civilisation to which they had attained; and this entirely by their own resources, uninfluenced and unaided by foreign example. He admits that the insulated position in which the island is kept may also be a consequence of the jealousy entertained by a despotic government, who may feel alarmed at the spread of ideas inimical to its durability.—*Athenaeum.*

SPANISH CHARACTER.

In the Spanish colonies, or in places occupied by the descendants of Spaniards, the treatment of servants of every kind is milder than in most other parts of the world. We must look for an explanation of this fact in the genuine goodness of the Spanish character, which, though overlaid and crushed down by a series of political and moral degradations, is still essentially excellent, and worthy of a far better destiny.—*Captain Basil Hall's Voyages.*

COTTAGE AND WORKHOUSE GARDENS.

"It gives us much pleasure," says our gifted and industrious countryman, Mr Loudon, in his *Gardener's Magazine* for February 1832, "to observe that the great benefits which arise from adding gardens to labourers' cottages are every year more and more felt all over the country. We had many proofs of this in our late tour, both in England and in Scotland; and most sincerely do we wish that government would pass a law to oblige all builders of cottages inalienably to attach a certain quantity of land to each as a garden. We have already strongly recommended workhouse gardens for the aged and infirm poor; and we had the pleasure of seeing, at Coventry (May 6, 1831), our ideas in great part carried into effect. The three parishes which compose the town of Coventry are under one system of management, as far as it respects the poor; and an old monastery, and its extensive garden, have been turned into a lodging and working-place. The garden is cultivated entirely by the inmates, and chiefly by the old men, as the women are supplied with in-door work; and there is a schoolmaster for teaching the children to read, write, and count. It was observed to us by Mrs Mercer, the highly respectable matron, who has the entire management of the establishment, under the direction of a committee, that all the old men who are able to work, however little, took great pleasure in being employed in the garden; and she only regretted that there was not more ground. Mrs Mercer is very fond of horticulture, and directs the cultivation of the garden under her care most judiciously. It was in the very best of order, and without a single weed. She has a border devoted to flowers; and as it does not contain many sorts, we venture to call on our friends in her neighbourhood, Mr Brown, Mr Knox, and Mr Oliver, to send her a few plants and seeds, and a few cuttings and suckers of shrubs and roses. We are persuaded that it would be a great improvement in the management of the workhouse poor of London, and of other large towns, to have workhouses in the country in the midst of a large garden, for their aged and infirm inmates, who might be usefully and agreeably employed in the gardens, in raising part of their own food. The idea of so many aged persons spending their last days in the workhouses is indeed deplorable, but it seems to be inseparable from the wretched state of society in this country. In the great Mary-le-bone workhouse, which has a front that, for length, and the size and number of the windows, might be compared to a Russian palace (and, indeed, it closely resembles that of General Apraxin at Moscow), there are constantly from eighty to a hundred and twenty old men and women, who are led or carried out, one by one, every morning, and set down on a bench under a shed, or, when the weather is fine, in the sun, where they remain almost in a state of torpor, being unable to help themselves, and having no one to attend them till they are led or carried, one by one, back again, at the time appointed for their next meal. What a picture of human desolation! If, instead of being placed upon benches, with nothing to gaze at but a brick wall, these persons were led into a garden, where they could see numbers of their fellow inmates at work, breathe the fresh air, see and smell the flowers, and hear birds and other rural sounds, the miserable lot would have some little alleviation. A number of them could perhaps assist in some of the lighter garden operations; the most infirm could scare away birds, or prepare gooseberries, and shell legumes for the kitchen. This might enable them to measure their time as it passes, and would afford some kind of amusement to divert their minds from incessantly dwelling on their own forlorn and helpless situation. Is it too much to say that something would be gained for the happiness of the human kind, if all men were agreed, that, wherever there was a habitation, whether for an individual family, or for a number of persons strangers to each other, such as hospitals, workhouses, prisons, asylums, infirmaries, and even barracks, there should be a garden? In our opinion, a dwelling without a garden ought not to exist."

THE TWO BLOWS.

Cardinal Mazarin was dictating one day a letter to his secretary. The latter, overcome with incessant work, fell asleep, and the cardinal continued dictating, while pacing up and down his study. When he had come to the conclusion, he turned towards his secretary, saying, "End as usual." He then perceived that the first lines of the letter only were written. The cardinal was very partial to that secretary, and treated him as a father. To awake him, he gave him a box on the ear; the secretary, in a fury, returned the blow. The cardinal, without showing the least emotion, said, coolly, "Now, sir, as we are both wide awake, let us proceed with our letter."—*The Parrot.*

FEEDING SHEEP IN WINTER.

The winter season being the period in which sheep occupy the turnip ground, it is essential to their comfort, at that inclement season, to study the clearing of the ground, so that, though they may be exposed to boisterous weather while eating on the break, they may have a place of shelter to flee to in case of a storm. This arrangement may not be difficult of accomplishment, when they have the choice of all the cleared ground, as they advance in the consumption of the crop. In the event of a heavy fall of snow,

when the turnips will be out of their reach (a slight fall they soon trample down), the snow should be cast off the turnips on the cleared part of the ground. Turnips are preserved in a fresh state under snow. In individual cases, the hoofs may grow so irregularly on the soft ground as to cause lameness. It is a safe precaution to examine the hoofs of the flock at short intervals of time, and pare away all excrescences. I have no doubt that, were this precaution regularly attended to, the foot-rot would not be so frequently exhibited among flocks in the low country.—*Stephens.*

STANDARD OF THE JANISSARIES.

Odd as it may seem, a *soup-kettle* is the standard of the Janissaries, an emblem rather more appropriate for a court of aldermen. Dr Walsh says that he saw in the streets of Constantinople an extraordinary greasy-looking fellow, dressed in a leathern jacket, covered over with ornaments of tin, bearing in his hand a lash of several leather thongs; he was followed by women, also fantastically dressed, supporting a pole on their shoulders, from which hung a large copper kettle. They walked through the main streets with an air of great authority, and all the people hastily got out of the way. This he found, on inquiry, was the soup-kettle of a corps of Janissaries, and always held in high respect; indeed, so distinguishing a characteristic of this body is their *soup*, that their colonel is called *Techorbadge*, or the distributor of soup. Their kettle, therefore, is in fact their standard; and whenever that is brought forward, it is the signal of some desperate enterprise, and in a short time twenty thousand men have been known to rally round their old insignia of war.

DUCKS.

Water, to swim in, is necessary to the old, and *injurious* to the very young. They never should be suffered to swim (if water be near) till more than a month old. The old duck will lay in the year, if well kept, ten dozen of eggs; and that is her best employment; for common hens are the best mothers. It is not good to let young ducks out in the morning to eat *slugs* and *worms*; for though they like them, these things kill them if they eat a great quantity. Grass, corn, white cabbages, and lettuces, and especially buck-wheat, cut when half ripe, and flung down in the haulm, make fine ducks. Ducks will feed on garbage, and all sorts of filthy things, but their flesh is *strong* and bad in proportion. They are, in Long Island, fattened upon a coarse sort of *crab*, called a horse-foot fish, prodigious quantities of which are cast on the shores. The young ducks grow very fast upon this, and very fat; but woe to him that has to *smell* them when they come from the spit; and as for *eating* them, a man must have a stomach indeed to do that! When young, they should be fed upon barley meal, or *curds*, and kept in a warm place in the night time, and not let out *early* in the morning. They should, if possible, be kept from water to *swim* in. It always does them harm; and if intended to be sold to be killed *young*, they should never go near ponds, ditches, or streams.—*Cobbett's Cottage Economy.*

EAST INDIA CUSTOMS.

In India, we have no stage coaches (thank me for the information); we must travel on horseback in the morning and evening, and I can give you no conception of the mobs of cattle and men which follow a British officer. At Holapore and Barada, I had one head servant, one second or valet, one goravalla or groom, one grass-cutter, one washerman, six baggage carriers, two camels, four ponies, and one charger, besides the orderlies or soldiers allowed by government, and the palankeen bearers (*doliwallas*), who, when not employed to carry the sick, are at the service of the surgeon. At Barada, I had, moreover, one *beal*, or, in common language, a thief or robber. This interesting gentleman is paid ten rupees a month, and his duty is to engage that none of his caste shall plunder your tent. He is armed with a sword and shield; but that is a farce, because your property is sacred if he snored all night, or was even absent. If you refuse to pay this *black mail*, you will assuredly be robbed. The *meum* and *tuum* has never been a consideration with this class of men, whose profession is to plunder. They are polished in their manners, and are intelligent; and if you fall among them, will treat you with hospitality. I slept a whole night in one of their villages without knowing it. I had nothing but a guide and my horse, for I had sent my baggage and servants forward to the next halt. I was in an open *durum solee*, or *shed* for travellers. In the morning, they brought me milk and fruit, fed my horse, made their salaam, and told me they were *beals*! I could scarcely obtain a glass of water in England without paying for it; blush, ye civilised men! the *beals* refused whatever I offered them! There is no accounting for the vagaries of the human mind; these gentlemen robbers will sometimes commit the most atrocious crimes with perfect indifference. They would not kill a cow for the world, but they will stab you to the heart without remorse.—*Letter from India.*

OBSERVANCE OF FOREIGN COUNTRIES.

There is not a single branch of science which does not require some labour and attention; there is not even a mechanical art to which some apprenticeship is not necessary. No naturalist would visit the Alps with a view to examine the structure of the globe, unless he had devoted some time and study to every object which could mature his judgment, and give validity to his opinions. Yet persons who have passed

their lives with books, who have seen human nature in print, or who have not seen it at all, go to distant nations, and describe as universal truths what they perceive there, under impressions arising from inexperience and astonishment. The usual feeling upon first visiting a foreign country is surprise, the natural attendant upon novelty; and the sentiment is shared not only by the vulgar, but by the enlightened. It is accompanied by pain or pleasure, as the objects seen are in discord or in harmony with the disposition of the observer; but in either case it is generally exaggerated. Every day diminishes the impression, till at length the customs which astonished inexperience are looked upon with as little wonder as those which were left at home. But no condition of mind is more hostile to calm observation than a state of emotion which magnifies and disfigures truth. On the other hand, again, when habit, which has the power of destroying sensibility to peculiar customs, has diminished the perception of things worthy of attention, much which, when new, excited astonishment, no longer attracts observation.—*Chenevix's Essay on National Character.*

ENGLISH SINBAD.

Purchas's Pilgrims comprehends "the admirable and strange adventures of Master Anthony Knyvet, who went with Master Cavendish in his second voyage," which, for marvels, if not for invention and imagination, may rival the adventures of Sinbad the Sailor. Knyvet wandered from the ship on the coast of Brazil, and was for many years among the "cannibals." Many is the wonderful escape from death which he makes. In Magellan's Straits, pulling off his stockings one night, all his toes came with them; but this is not so bad as the fortune of one Harris, who blowing his nose with his fingers, throws it into the fire, and never recovers it again, as Knyvet seems to have done his toes, by the good offices of a surgeon whom Cavendish employed, and who cured with muttering words. In the Straits he saw both giants and pigmies. The footmarks of the giants at Port Desire were four times the length of an Englishman's foot. In the Straits, their stature was fifteen and sixteen spans long; and at Port Famine, or San Felipe, the desolate station of the Spanish colony, four or five thousand pigmies, with mouths reaching from ear to ear, were seen at one time whose height was from four to five spans. Some of Knyvet's marvels relate to the singular subject of demoniac possession and satanic influence among the tribes with whom he sojourned. These accounts, and others of the elder voyagers, are not materially different from those which we receive of the South Sea islanders at the present time, and which, we are assured by Ellis, some of the early missionaries were disposed to believe. On his return to England, Master Knyvet told Purchas that he once heard an Indian conferring with the spirit which possessed him, and threatening that, if it did not use him better, he would turn Christian; the spirit took the hint and left him.—*Edinburgh Cabinet Library.*

USEFUL FAMILY RECEPT.

To destroy moths, or drive them from cloth, hairy tippets, muffs, &c., the seed of the hibiscus *abelmoschus* (the vegetable musk seed) should be thinly distributed over the articles, and between the folds of cloth. These seeds are highly esteemed by the French perfumers for their peculiar delicate fragrance. To destroy the vitality of the eggs, which produce the moths deposited in woollen cloth, hairy tippets, muffs, &c., a weak solution of the oxy muriate of mercury in the spirit of rosemary (about half a drachm to a pint), or weak solution of the arseniate of potass in the same spirit (about fifteen grains to a pint), is employed by those who prepare the skins of birds and animals for stuffing.

THE BANK OF NORWAY.

There is no establishment of the kind in Europe which is better organised than the National Bank of Norway. It is divided into three departments, comprising the *Loan Bank*, the *Cashier's Department*, and the *Deposit and Pledge Bank*. It was instituted in the year 1816, and opened with a capital of two millions of species dollars in coin (about £400,000), which were subscribed by the affluent classes throughout the kingdom. The Central Bank is kept at Trondheim (commonly spelt *Drontheim*), and branch banks are established in other principal places. Its affairs are conducted by a board of directors, who are nominated by the Storting or Norwegian Diet. The current coins of the country consist of silver pieces of the value of one species dollar (circa 4s.), half a sp. dollar, and a fifth part of a sp. dollar; besides eight-shilling pieces, and other smaller silver currency, all of which have been struck at the rate of nine and a half species dollars to the mark of fine silver. Norway, likewise, possesses a paper currency, which consists of bank notes of 100, 50, 10, 5, and even 1 sp. dollar each; and an excellent index to their respective values has been devised, for the purpose of obviating mistakes; they are severally printed on red, green, yellow, blue, and white paper. Had this precedent been adopted in England, the crime of changing notes from a lower to a higher value would have been happily unknown to our courts of law. Some idea may be formed of the degree of credit which the National Bank enjoys in Norway, from the single fact that, in the year 1830, no larger a sum than 3040 dollars (£600) was required for paying its notes in silver! The Proprietary received in that year a dividend of seven per cent.

LIST OF MEDICINES FOR DISTEMPER IN DOGS.

Some rely entirely on purgatives; others bleeding and physicking; others on emetics; some put tar upon the nose; others a pitch plaster; and some cauterise the nasals; some inject vinegar into the nose, others hellebore, and others a solution of camphor; some cut off the tail, others the ears; some give tobacco and olive oil, others the golden sulphure of antimony; the keeper gives the curpeth's mineral; the more scientific of these gentry will knock down the disease, and the dog too, with arsenic. The gentleman will give compound tincture of benjamin, the farmer common salt; the medical man sulphuric ether, or emetics and saltpur, or emetics and jalap, or emetics and scammony.—From a very able Lecture of Mr Youatt on Distempers.

PUBLIC LANDS, UNITED STATES.

The public, or, as we should call them, the crown lands, of the United States of America, consist almost wholly of territory wrested from the Indians, for seven-eighths of it come under this description. Up to the year 1826, the quantity of land purchased was officially reported as amounting to 261,695,427 acres, of which 7,707,085 had been appropriated to the endowment of schools and colleges, and 40,396,382 had been sold for a sum of £10,088,720 sterling, or at the rate of a minute fraction less than five shillings average per acre. The number of acres acquired from the Indians in the states of Ohio, Indiana, Illinois, Louisiana, Alabama, Mississippi, Missouri, the Michigan and Arkansas territories, and included in the foregoing statement, was 209,219,865.—*Athenæum*.

THE SUBTLE JACK.

The wood-cutters and hunters in their out-door and sylvan life became familiar with all the living creatures of these prolific regions, and gave them English names, significant of their habits. They adopted the superstition of the Spaniards against killing the carrion crows which were found so useful in clearing the country of the putrid carcasses of animals. Trains of these birds gathered from all quarters about the hunters, and regularly followed them into the savannahs for their own share of the prey. A bird which they named the *Subtle Jack* was about as big as the pigeons of the Bay of Campeachy. It suspended its nest from the boughs of lofty trees, choosing such as up to a considerable height were without limbs. The branches selected were those that spread widest, and of these the very extremity was chosen. The nests hung down two or three feet from the twigs to which they were fastened, and looked like "cabbage-nets stuffed with hay." The thread by which it is suspended, like the nest itself, is made of long grass ingeniously twisted and interwoven, small at the twig, but thickening as it approaches the nest. On trees that grow singly and apart, the birds build all round; but where the trees stand in proximity to others, the *Subtle Jack* chooses only those that border upon a savannah, pool, or creek; and of these the limbs that stretch over the water or the grass, avoiding such as may be easily approached from neighbouring trees. The nest has a hole at the side for the bird to enter. "Tis pretty," says Dampier, "to see twenty or thirty of them hanging round a tree."—*Edinburgh Cabinet Library*.

POWERS OF THE FRENCH PRESS.

From the date of the introduction of the art of printing into France, up to the year 1814, the press of that kingdom had attained the power of producing 42,675,039 sheets annually: such was the immense production to which this glorious invention gradually rose in about three centuries and a half! And yet, between 1814 and 1826, which is scarcely more than a *thirtieth part* of the former interval, the increase had become above two-fold; for in those twelve years no fewer than 98,836,055 sheets were, on the average, annually printed.

THE POET CRABBE.

The late Rev. George Crabbe died in the 88th year of his age. He was a native of Aldeburgh, where his father held a situation in the customs. Bred up to the profession of physic, he for some time practised as a surgeon in his native town; but disliking his profession, he quitted Aldeburgh, and repaired to the metropolis, where he arrived without having formed any particular plan, but where he hoped that the exertion of his talents might enable him to succeed. Whilst in London, he obtained an introduction to the Right Hon. Edmund Burke, who, struck with the talents he displayed, introduced him to some of the first characters of the age, and among others to the late Duke of Rutland, Lord Thurlow, Dr Johnson, and Sir Joshua Reynolds. Owing to the substantial favour of the former nobleman, he was induced to take orders in 1781. In 1789, after the death of his noble patron, he was presented by Lord Thurlow, on the recommendation of the Duchess Dowager, to the rectories of Muston, in Leicestershire, and of West Allington, in Lincolnshire. In 1814, on the presentation of the present Duke of Rutland, he was instituted to the valuable rectory of Trowbridge. During his first acquaintance with Mr Burke, and under his immediate auspices, he published his poem, "The Village." After an interval of twenty-two years, he again appeared before the public as the author of the "Parish Register." In 1810, he published "The Borough;" in 1812, "Tales in Verse;" in 1819, "Tales of the Hall;"—works of which the highest excellence is their truth to nature, but nature in her homely garb. In

private life, Mr Crabbe was modest, retired, and unassuming; feelingly alive to the miseries of his fellow-creatures, he devoted no small portion of his time to their alleviation; and in doing this, united to his ministerial his medical character, and thus rendered himself beloved and useful in a two-fold capacity. Mr Crabbe was married in 1783 to Miss Elmy, one of the daughters and co-heiresses of the late — Tovell, Esq., of Parham, by whom he has left children.

PRESENCE OF MIND.

During Lord Exmouth's attack on the batteries of Algiers, in 1816, the Algerines used a great number of red-hot shot, particularly in the early part of the action. On board his majesty's bomb *Infernal*, one of these comfortable articles came in, through Wallis the purser's cabin, in the after cockpit; and having bundled a shelf full of books on the top of the assistant surgeon, Jones, who was lying in the purser's cot, given over with the Gibraltar fever, it rolled across into the opposite cabin, and was there got into a bucket of water, by the gunner and some others stationed near the spot. This interesting amusement was but just concluded, when the men in the magazine, the door to which was close by, heard a desperate smash among the powder barrels, and were almost covered with a cloud of loose dust and powder, which was thrown all over them. Knowing the business which employed the gunner in the cockpit, but just the moment before, they naturally enough, in the confusion of the moment, called out to him, "A red-hot shot in the magazine!" and were rushing out of it to circulate wider the same cry, should their new red-hot acquaintance permit them. The ill consequences of this may be easily conceived; the only chance for any one on such an occasion being to jump at once overboard. The gunner in an instant saw that if the cry was false, it was folly to spread it, and, if true, it was useless. He flew to the magazine, shoved the fellows back into it, and turned the key on them, and stood there, with his hand on the lock, till he knew all danger must be past; rather a queerish situation, gentle reader! The chaps were afterwards a little laughed at; for, strange to say, we could not find this intruder on their equanimity of temper any where: and many doubted at last if any shot had come into it at all. To be sure there were the broken barrels and the spilled powder in favour of the narrators of the story; but this seemed still not fully to convince; for even the worst of dangers generally get laughed at when they are over, by our happy-go-lucky sons of Neptune. When, however, she came to return her powder into store, after arriving in the Thames, the mystery was solved; it was then found that the said shot had gone through four barrels of powder, and lodged itself very comfortably in the middle of a fifth. The gunner's name was Coombs; and the last time I saw this man, who had shown such an unexampled presence of mind, was in 1824; he was then mending shoes in a solitary room in the back lanes of Deptford, to help out a precarious existence.—*United Service Journal*.

SPORTS OF INSECTS.

It is not generally known that some of the smallest insects are discovered to enjoy themselves in sports and amusements, after their ordinary toils, or satiating themselves with food, just as regularly as is the case with many human beings. They run races, wrestle with each other, and, out of fun, carry each other on their backs much in the same manner as boys. These pleasing characteristics of insects are particularly observable among ants, which are remarkable for their sagacity. Bonnet, a French author, says he observed a small species of ants, which, in the intervals of their industry, employed themselves in carrying each other on their backs, the rider holding with his mandibles the neck of his bearer, and embracing it closely with his legs. Gould, another writer on ants, mentions that he has often witnessed these exercises, and says, that in all cases, after being carried a certain length, the ant was let go in a friendly manner, and received no personal injury. This amusement is often repeated, particularly among the hill ants, who are very fond of this sportive exercise. It was amongst the same species that Huber observed similar proceedings, which he has described with his usual minuteness. "I approached," he says, "one day, to the fornicary of wood ants, exposed to the sun, and sheltered from the north. The ants were heaped upon one another in great numbers, and appeared to enjoy the temperature on the surface of the nest. None of them were at work; and the immense multitude of insects presented the appearance of a liquid in the state of ebullition, upon which the eye could scarcely be fixed without difficulty; but when I examined the conduct of each ant, I saw them approach one another, moving their antennæ with astonishing rapidity, while they patted, with a slight movement, the cheeks of other ants. After these preliminary gestures, which resembled caressing, they were observed to raise themselves upright on their hind legs by pairs, struggle together, seize each other by a mandible, foot, or antennæ, and then immediately relax their hold to recommence the attack. They fastened upon each other's shoulders, or bellies, embraced and overthrew each other, then raised themselves by turns, taking their revenge without producing any serious mischief. They did not spurt out their venom as in their combats, nor retain their opponents with that obstinacy which we observe in their real quarrels."

PECULIARITIES OF THE PRESS.

The stereotyped phraseology of the press is to us a standing joke—a perpetual and never-to-be-exhausted spring of "rational entertainment." Is there an unusual shower of rain in any village within five hundred miles of London?—of course its like was not known "in the memory of the oldest inhabitant." Does it happen to take place in town instead of the country?—of course "the metropolis was visited by one of the most awful," &c. Is there a chimney on fire?—of course "the devouring element" blazes through a long paragraph. Is a straw-bonnet maker's apprentice robbed of her reticule, or exposed to the indignity of having her veil gently thrown back, displaying her beauties to the gaze of the vulgar?—of course "the deed was perpetrated" either by a "wretch," or "a monster in the human form." Is somebody *acquitted* by the Lord Mayor upon a charge of swindling?—of course he is a person of very "interesting appearance." Is somebody convicted upon a similar charge?—of course "he is a suspicious-looking character." Does a gentleman fail to recover at the hands of a magistrate a wife who has run away from him fifteen times?—of course "his feelings may be more easily conceived than described." Do five fools, aged fifty-one years each, happen to meet together at any time on this side of the antipodes?—of course it is discovered that "their united ages amount to two hundred and fifty-five years." Are people married now-a-days?—no; they are always led to the "hymeneal altar." Are they hanged?—by no means; they are "launched into eternity." Do rich landowners give their famished tenantry a dinner at Christmas?—it is hailed as a noble specimen of "genuine English hospitality."—*Monthly Magazine*.

GODS OF WAR.

The three colossal cannon which the French captured from the Prussians in the year 1806, have been brought to Paris from Metz. They are three of twelve of the same dimensions, which were called "the Apostles," and were cast in Brandenburg in 1665. Independently of the Brandenburg arms, they bear the effigy of the elector on foot, and in complete armour. They are to be placed in charge of the *Invulnables*, in conjunction with the far-famed cannon, "Ehrenbreitstein," which was cast at Treves in 1529.

SCOTTISH DOOMSTERS.

The name of this officer of the High Court of Justiciary, as noticed by the Author of Waverley, was equivalent to the pronouncer of doom or sentence. In this comprehensive sense, the Judges of the Isle of Man were called Dempsters. But in Scotland the word was long restricted to the designation of an official person whose duty it was to recite the sentence after it had been pronounced by the court and recorded by the clerk; on which occasion the Dempster legalised it by the words of form, "And this I pronounce for doom." For a length of years, the office, as mentioned in the text, was held *in commendam* with that of the executioner; for when this odious but necessary officer of justice received his appointment, he petitioned the Court of Justiciary to be received as their Dempster, which was granted, as a matter of course.

The production of the executioner in open court, and in presence of the wretched criminal, had something in it hideous and disgusting to the more refined feelings of later times. But if an old tradition of the Parliament House of Edinburgh may be trusted, it was the following circumstance which occasioned the disuse of the Dempster's office:—

It chanced at one time that the office of public executioner was vacant. There was occasion for some one to act as Dempster; and considering the party who generally held the office, it is not wonderful that a *locum tenens* was hard to be found. At length one Hume, who had been sentenced to transportation for an attempt to burn his own house, was induced to consent that he would pronounce the doom on this occasion. But when brought forth to officiate, instead of repeating the doom to the criminal, Mr Hume addressed himself to their lordships in a bitter complaint of the injustice of his own sentence. It was in vain that he was interrupted and reminded of the purpose for which he had come hither. "I ken what ye want of me weel enough," said the fellow; "ye want me to be your Dempster; but I am come to be none of your Dempster; I am come to summon you, Lord T—, and you, Lord E—, to answer at the bar of another world for the injustice you have done me in this." In short, Hume had only made a pretext of complying with the proposal, in order to have an opportunity of reviling the judges to their faces, or giving them, in the phrase of his country, "a sloan." He was hurried off amid the laughter of the audience; but the indecorous scene which had taken place contributed to the abolition of the office of Dempster. The sentence is now read over by the clerk of the court, and the formality of pronouncing doom altogether omitted.

PRICE THREE HALFPENCE.

DISCOVERY AND PUNISHMENT OF MURDER BY CIRCUMSTANTIAL EVIDENCE.

THE trials of different malefactors before our higher criminal courts, in recent times, on charges of murder, in which nothing beyond the testimony of what is called *presumptive evidence* could be brought forward, may well induce a more close examination of the law of Scotland on this delicate point. As the preferable evidence of two witnesses, or even one witness, can seldom be obtained in these painful cases, the law allows, as the next best, evidence founded on circumstances, when such circumstances are capable of producing the same, or nearly the same, conviction on the mind as would be produced by direct testimony. In judging by circumstantial evidence, it is the united effect of the whole that is to be taken into view, and which produces conviction on the mind. Many circumstances, which, when taken separately, appear trifling and inconclusive, operate strongly when combined with others; and this combination gives to an apparently minute circumstance an importance which is decisive. Yet, with all this species of reasoning, it is undeniable, that, in many instances, innocent persons have been executed entirely through the force of this concatenation of circumstances, while, doubtless, thousands of actual transgressors have been justly punished on no other grounds of evidence.

As one or two instances are worth a thousand dissertations, I shall present two strong cases, in one of which the real murderer, and, in the other, the supposed murderer, were brought to the gallows. The first case, for which only I have room in this number, is that of William Richardson, who was tried at Dumfries in the spring of 1787—a case remarkably striking in all its circumstances, and particularly so in the way in which the discovery of the prisoner's guilt was made.

In autumn 1786, a young woman, who lived with her parents in a remote district in the stewartry of Kirkcudbright, was one day left alone in the cottage, her parents having gone out to their harvest field. On their return home, a little after mid-day, they found their daughter murdered, with her throat cut in a most shocking manner. The circumstances in which she was found, the character of the deceased, and the appearances of the wound, all concurred in excluding any presumption of suicide; while the surgeons who examined the wound were satisfied that it had been inflicted by a sharp instrument, and by a person who must have held the instrument in his left hand. On examining the ground about the cottage, there were discovered the footsteps seemingly of a person who had been running hastily from the cottage, and by an indirect road, through a quagmire or bog, in which there were stepping-stones.

It appeared, however, that the person, in his haste and confusion, had slipped his foot and stepped into the mire, by which he must have been wet nearly to the middle of the leg. The prints of the footsteps were accurately measured, and an exact impression taken of them; and it appeared they were those of a person who must have worn shoes, the soles of which had been newly mended; and which, as is usual in that part of the country, had iron knobs, or nails, in them. There were discovered also along the track of the footsteps, and at certain intervals, drops of blood; and on a stile, or small gateway, near the cottage, and in the line of the footsteps, some marks resembling those of a hand which had been bloody. Not the slightest suspicion at this time attached to any particular person as the murderer; nor was it even suspected who might be the father of the child, of which the girl was found to be pregnant.

At the funeral, a number of persons of both sexes attended, and the steward-depute thought it the fittest

opportunity of endeavouring, if possible, to discover the murderer, conceiving rightly, that, to avoid suspicion, whoever he was, he would not on that occasion be absent. With this view he called together, after the interment, the whole of the men who were present, being about sixty in number. He caused the shoes of each of them to be taken off and measured; and one of the shoes was found to resemble pretty nearly the impression of the footsteps hard by the cottage. The wearer of this shoe was the *schoolmaster* of the parish, which led immediately to a suspicion that he must have been the father of the child, and had been guilty of the murder to save his character. On a closer examination, however, of the shoe, it was discovered that it was pointed at the toes, whereas the impression of the footstep was rounded at that place. The measurement of the rest went on, and, after going through nearly the whole number, one at length was discovered which corresponded exactly to the impression, in dimensions, shape of the foot, form of the sole, apparently newly mended, and the number and position of the knobs. The young man to whom the shoe belonged, on being asked where he was the day the deceased was murdered, replied, seemingly without embarrassment, that he had been all that day employed at his master's work—a statement which his master and fellow-servants confirmed. This going so far to remove suspicion, a warrant of commitment was not then granted; but some circumstances occurring a few days thereafter, having a tendency to excite it anew, the young man was apprehended and lodged in jail. On his examination, he acknowledged he was *left-handed*; and some scratches being observed on his cheek, he said he had got them when pulling nuts in a wood a few days before. He still adhered to what he had said, of his having been, on the day of the murder, employed constantly at his master's work, at some distance from the place where the deceased resided. But in the course of the *precognition* it turned out that he had been absent from his work about half an hour (the time being distinctly ascertained) in the course of the forenoon of that day—that he had called at a smith's shop, under pretence of wanting something which it did not appear he had any occasion for—that this smith's shop was on the way to the cottage of the deceased. A young girl, who was some hundred yards from the cottage, said, about the time the murder was committed (and which corresponded to the time that Richardson was absent from his fellow-servants), she saw a person exactly with Richardson's dress, in appearance, running hastily towards the cottage, but did not see him return, though he might have gone round by a small eminence, which would intercept him from her view, and which was the very track where the footsteps had been traced. His fellow-servants now recollected, that, on the forenoon of that day, they were employed with Richardson in driving their master's carts; and in passing by a wood, which they named, Richardson said that he must run to the smith's shop, and would be back in a short time. He then left his cart under their charge, and they having waited for him about half an hour, which one of the servants ascertained by having at the time looked at his watch, they remarked on his return that he had been much longer absent than he had said he would; to which he replied, that he had stopped in the wood to gather some nuts. They observed at this time one of his stockings wet and soiled, as if he had stepped into a puddle, on which they asked him where he had been. He said he had stepped into a marsh, the name of which he mentioned; on which his fellow-servants remarked, that he must have been either drunk or mad if he had stepped into that marsh, as there was a footpath which went along

the side of it. It then appeared, by comparing the time he was absent with the distance of the cottage from the place where he had left his fellow-servants, that he might have gone there, committed the murder, and returned to them. A search was then made for the stockings he had worn on that day. They were found concealed in the thatch of the apartment where he slept, appeared to be much soiled, and to have some drops of blood on them. The last he accounted for by saying, first, that his nose had been bleeding some days before; but it being observed that he had worn other stockings on that day, he next said that he had assisted at bleeding a horse when he wore these stockings; but it was proved he had not assisted, but had stood on that occasion at such a distance that none of the blood could have reached him.

On examining the mud or sand upon the stockings, it appeared to correspond precisely with that of the mire or puddle adjoining to the cottage, and which was of a very particular kind, none other of the same kind being found in that neighbourhood. The shoemaker was then discovered who had mended his shoes a short time before, and he spoke distinctly to the shoes of the prisoner, which were exhibited to him, as having been those he had mended. It then came out that Richardson had been acquainted with the deceased, who was considered in the county as of weak intellect, and had, on one occasion, been seen with her in a wood, in circumstances that led to a suspicion that he had had criminal conversation with her; and on being glibed with having such connection with one in her situation, he seemed much ashamed, and greatly hurt. It was proved, farther, by the person who sat next to him when the shoes were measuring, that he trembled much, and seemed a good deal agitated; and that, in the interval between that time and his being apprehended, he had been advised to fly, but his answer was, "Where can I fly to?" On the other hand, evidence was brought to show, that, about the time of the murder, a boat's crew from Ireland had landed on that part of the coast, near to the dwelling of the deceased; and it was said some of that crew might have committed the murder, though their motive for doing so it was difficult to explain, it not being alleged that robbery was their purpose, or that any thing was missed from the cottages in the neighbourhood. The jury, by a great plurality of voices, found him *guilty*.

Before his execution, he confessed he was the murderer, and said it was to hide his shame in having paid attentions to a woman of weak intellect, that he committed the deed. He mentioned also to the clergyman who attended him, where the knife could be found with which he had perpetrated the murder. It was found, accordingly, in the place he described, under a stone in a wall, with marks of blood upon it.

Having thus offered a striking instance of the value of circumstantial evidence, in a subsequent number I shall present one showing the very reverse; after which it may be of use to give some general advice to jurymen on so momentous a subject.

A TALE OF THE FORTY-FIVE.

NEVER, perhaps, did any city, upon the approach of a foreign enemy, betray such symptoms of consternation and disorder, as did Edinburgh on the 16th of September 1745, when it was understood that Prince Charles Edward, with his army of Highlanders, had reached a village three miles to the westward, unresisted by the civic corps in which the hapless city had placed its last hopes of defence. A regiment of dragoons, which had retreated on the previous day from Stirling, and another which happened to be encamped near Edinburgh, having joined their strengths to that of the town-guard and volunteers, had that forenoon marched boldly out of town, with the determined pur-

pose of opposing the rebels, and saving the town; but after standing very bravely for a few hours at Corstorphine, the spectacle of a single Highlander, who rode up towards them and fired off his pistol, caused the whole of these gallant cavaliers to turn and fly; nor did they stop till they had left Edinburgh itself twenty miles behind. The precipitate flight of regular troops was the worst possible example for a body of raw undisciplined citizens, who were too much accustomed to the secure comforts of their firesides, to have any relish for the horrors of an out-of-doors war with the unscrupulous mountaineers. The consequence was, that all retreated in confusion back to the city, where their pusillanimity was the subject of triumphant ridicule to the Jacobite party, and of shame and fear to the rest of the inhabitants.

In their dilemma, as band after band poured through the West Port, and filled the ample area of the Grassmarket, the magistrates assembled in their council chamber, for the purpose of "wondering what was to be done." The result of their deliberations was, that a full meeting of the inhabitants should be held, in order that they might be enabled to shape their course according to the general opinion. Orders were immediately given to this effect, and in the course of an hour they found a respectable assemblage of citizens, prepared, in one of the churches of St Giles's, to consider the important question of the defensibility of the town.

The appearance of the city, on this dreadful afternoon, was very remarkable, and such as we hope it will never again exhibit. All the streets to the west of St Giles's were crowded with citizen volunteers, apparently irresolute whether to lay down their arms or to retain them, and whose anxious and crestfallen looks communicated only despair to the trembling citizens. The sound of hammers was heard at the opening of every lane, and at the bottoms of all important turnpike stairs, where workmen were busied in mounting strong doors, studded thickly with nails, moving on immense linges, and bearing bolts and bars of no ordinary strength—the well-known rapacious character of the Highlanders, not less than their present hostile purpose, having suggested this feeble attempt at security. The principal street was encumbered with the large, tall, pavilion-roofed family carriages of people of distinction, judges, and officers of the crown, which, after being hastily crammed with their proper burdens of live stock, and laden a-top with as much baggage as they could carry, one after another wheeled off down the High Street, through the Netherbow, and so out of town. A few scattered groups of women, children, and inferior citizens, stood near that old-accustomed meeting place, the Cross, round the tall form of which they seemed to gather, like a Catholic population clinging to a sacred fabric, which they suppose to be endowed with some protecting virtue.

At the ordinary dinner hour, when the streets were, as usual, in a great measure deserted, and while the assemblage of citizens were still deliberating in the New Church aisle, the people of the High Street were thrown into a state of dreadful agitation, by a circumstance which they witnessed from their windows. The accustomed silence of "the hollow hungry hour" was suddenly broken by the clatter of a horse's feet upon the pavement; and, on running to their windows, they were prodigiously alarmed at the sight of one of their anticipated foes riding boldly up the street. Yet this alarm subsided considerably, when they observed that his purpose seemed pacific, and that he was not followed by any companions. The horseman was a youth, apparently about twenty years of age, with a remarkably handsome figure and gallant carriage, which did not fail in their effect upon at least the female part of the beholders. The most robust Highland health was indicated in his fair countenance and athletic form: and, in addition to this, his appearance expressed just enough of polish not to destroy the romantic effect produced by his wild habiliments and striking situation. The tight tartan trews showed well upon a limb, of which the symmetry was never equalled by David Allan, the national painter, so remarkable for his handsome Highland limbs, and of which the effect, instead of being impaired by the clumsy boot, was improved by the neat brogue, fastened as it was to the foot by sparkling silver buckles. He wore a smart round bonnet, adorned with his family cognisance—a bunch of ivy—and from beneath which a profusion of light brown tresses, tied with dark ribbons, flowed, according to the fashion of the time, about half way down his back. He carried a small white flag in his hand, and bore about his person the full set of Highland arms—broadsword, dirk, and two silver-mounted pistols. Many a warm Jacobite heart, male and female, palpitated at sight of his graceful figure, and a considerable crowd of idle admirers, or wonderers, followed him up the broad noble expanse of the High Street.

By this crowd, who soon discovered that his purpose was the delivery of a letter from the Chevalier to the magistrates, he was ushered forward to the opening of a narrow passage, which in those days led through a pile of buildings called the Luckenbooths, towards the door of Haddo's Hole Church, a passage called in the old Scottish language a stile, which, moreover, was traversed in 1628 by King Charles the First, when he went to open the Scottish Parliament in the High Tolbooth. Here the Highlander dismounted, and after throwing his bridle over

the hook at a saddler's door, close to the corner of the stile, was led forward into the lobby of the church, from which the hum of active discussion was heard to proceed. On requesting to be introduced to the magistrates, he was informed by an official wearing their livery, that the church was so very much crowded, that "there would be nae possibility of either getting him in to see the magistrates, or the magistrates out to see him," but that his letter might be handed into them over the heads of the crowd. To this expedient the messenger consented, and accordingly it was immediately put in execution. In a few moments after it had left the keeper's hands, a dead silence seemed to fall upon the company, and after a renewed tumult and a second silence, those who stood in the lobby heard a voice reading a few words aloud, apparently those of the letter. The voice was, however, interrupted in a few seconds by the clamour of the whole assembled people, who presently rose in confusion, and made a tumultuous rush towards the door. On hearing and observing these alarming symptoms, the city officer, with inconsiderate rashness, thought it his duty to seize the author of so much supposed mischief, and accordingly made a dash at the stranger's collar, calling upon the town guardsmen present to close in upon him and intercept his retreat. But the prompt and energetic Highlander was not to be so betrayed. With a bound like the first movement of the startled deer, he cleared the lobby, and made for his horse. Two dragoons standing without, and who, observing the rush from the door, threw themselves in the stranger's way, were in the same instant felled to the ground; and before any other person could lay hands upon him, the maltreated messenger threw himself upon his horse, drew his sword, and in a transport of rage shouted defiance to all around. Whirling his weapon round his head, he stopped a few seconds amidst the terrified crowd; and then, striking spurs into his horse's sides, rode along the street, still vociferating loud defiance to all the detached military parties which he met. No attempt, however, was made to prevent his escape, or to offer him further violence. One symptom of offensive warfare alone occurred, and that originated in an accident; for an old guardsman, who was overturned on the causeway by the brush of the passing steed, could not help discharging his redoubted piece; the shot, however, doing no other harm than wounding a golden peacock which overhung the window of a fashionable milliner in the fourth flat of the Luckenbooths. After clearing the narrow defile of the Luckenbooths, and getting into the full open street, the Highland cavalier for once turned round, and, with a voice broken by excess of indignation, uttered a thundering malediction against all Edinburgh for its breach of the articles of war, and a challenge to the prettiest man in it who would meet him upon honourable terms. He then galloped briskly down the High Street, still brandishing his broadsword, the people making way for him on all sides, by running down the numerous alleys leading from the street, and terminated his daring exploit, unscathed and undaunted, by passing out at the Netherbow Port, of which the enormous folding doors, like the turnpikes in John Gilpin, flew open at his approach.

It is irrelevant to our purpose to describe the consternation under which the inhabitants of Edinburgh passed the whole of that evening and night, or the real terror which next morning seized them, when they understood that the insurgents were in possession of the town. Moreover, as it would not be proper to encumber our narrative with well-known historical details, we shall also pass over the circumstances in this remarkable civil war which followed upon the capture of the city, and content ourselves with relating the simple events of a love tale, in which the hero just introduced to the notice of our readers acted a conspicuous part.

About a month after the rebels had entered Edinburgh, and while Prince Charles Edward was still fondly lingering in the palace which had sheltered so many of his ancestors, a young gentlewoman named Helen Lindsay, the daughter of a whig writer to the signet in Edinburgh, was one fine October evening taking a solitary walk in the King's Park. The sun had gone down over the Castle, like the fire-shell dropping into a devoted fortress, and the lofty edifices of the city presented on the eastern side nothing but dark irregular masses of shade. The Park, which a little before had been crowded with idle and well-dressed people, waiting perhaps for a sight of the Prince, was now deserted by all except a few Highland soldiers, hurrying to or from the camp at Duddington, and by the young lady above mentioned, who continued, in spite of the deepening twilight, to saunter about, seeming to await the hour of some assignation. As each single Highland officer or group passed this lady, she contrived to elude their observation by an adroit management of her plaid; and it was not till the gathering darkness rendered her appearance at such a time and place absolutely suspicious, that at length one gallant mountaineer made bold to accost her. "Ah, Helen," he exclaimed, "how delighted am I to find you here!—for I expected you to be waiting at the bottom of the walk—and thus I see you five minutes sooner than I otherwise would have done." "I would rather wait near the Palace than at that fearsome place, at this time of night, William," said the young lady; "for, let me tell you, you have been a great deal later o' comin' than you should have been."

"Pardon me, my angel!" answered the youth; "I have been detained by the Prince till this instant. His Royal Highness has communicated to me no very pleasant intelligence—he is decisive as to our march commencing on the morning after to-morrow, and I am distracted to think of parting with you. How shall I—how can I part with you!" "Oh! never mind that, Willie," cried the lady in a tone quite different from his, which was highly expressive of a lover's misery; "if your enterprise prove successful, and you do not get your head broken, or beauty spoilt, you shall perhaps be made an earl, and marry some grand English countess; and I shall then content myself with young Claver the advocate, who has been already so warmly recommended to me by my father, and who would instate me to-morrow, if I chose, as his wedded wife, in the fine house he has just bought in Forrester's Wynd." "To the devil with that beast!" cried the jealous lover in Gaelic. "Do you think, Helen, that I could ever marry any one but you, even though it were the queen on the throne? But perhaps you are not so very resolute in your love matters, and could transfer your affections from one object to another as easily and as quickly as you could your thoughts, or the glance of your eyes." "Ah, Willie, Willie," said the lady, still in a jocular tone, "I see you are a complete Heilanter—fiery and irritable. I might have kenn'd that the first moment I ever saw ye, when ye bravaeded a' Edinburgh because a silly toon-officer tried to touch ye. Wad ye flee up, man, on your ain true love, when she merely jokes ye a wee?" "Oh, if that be all, Helen," said the youth humbly, "I beg your grace. Yet, methinks, this is no time for merriment, when we are about to part, perhaps for ever. How, dearest Helen, do you contrive to keep up your spirits under such circumstances?" "Because," said the young lady, "I know that there is no necessity for us parting, at least for some time to come; for I am willing to accompany you, if you will take me, to the very world's end. There's sincerity and true love for you!" Surprised and delighted with this frank offer, the lover strained his mistress passionately to his bosom, and swore to protect her as his lawful wife till the latest moment of his existence. "You shall travel," he said, "in my sister Lady Ogilvie's carriage, and be one of the first British ladies to attend the Prince's levee in St James's at Christmas. Our marriage shall be solemnised at the end of the first stage." The project was less than rational; but when was reason any thing to love? Many avowals of mutual attachment passed between the parties, and, after projecting a mode of elopement, they parted—William Douglas taking the road for the camp at Duddington, and Helen Lindsay hastily returning to the town.

The morning of the 1st of November broke drearily upon Edinburgh, showing a dull frosty atmosphere, and the ground covered with a thin layer of snow. It was the morning of the march; and here and there throughout the streets stood a few bagpipers, playing a reveille before the lodgings of the great officers of the clans. One or two chiefs were already marching down the street, preceded by their pipers, and followed by their men, in order to join the army, which was beginning to move from Duddington. The Highland guard, which had been stationed, ever since the Chevalier's arrival, at the Weigh-house, was now leaving its station, and moving down the Lawnmarket to the merry sound of the bagpipe, when a strange circumstance occurred.

Just as the word of command had been given to the Weigh-house guard, the sash of the window in the third floor of an adjacent house was pushed up, and immediately after, a female figure was observed to issue therefrom, and to descend rapidly along a rope towards the pavement below. The commander of the guard no sooner perceived this than he sprang forward to the place where the figure was to alight, as if to receive her in his arms; but he did not reach it before the lady, finding the rope too short by several yards, dropped with a slight scream on the ground, where she lay apparently lifeless. The officer was instantly beside her—and words cannot describe the consternation and sorrow depicted in his face, as he stooped, and with gentle promptitude lifted the unfortunate lady from the ground. She had fainted with the pain of what soon turned out to be a broken limb; and as she lay over the Highlander's arm, her travelling hood falling back from her head, disclosed a face which, though exquisitely beautiful, was as pale and expressionless as death. A slight murmur at length broke from her lips, and a tinge of red returned to her cheeks as she half articulated the word "William." William Douglas, for it was he, hung over her in silent despair for a few moments, and was only recalled to recollection when his men gathered eagerly and officiously around him, each loudly inquiring of the other the meaning of this strange scene. The noise thus occasioned soon had the effect of bringing all to an understanding; for the father of the lady, in a nightcap and morning-gown, was first observed to cast a hurried glance over the still open window above, and was soon after in the midst of the group, calling loudly and distractedly for his daughter, and exclaiming budily against the person in whose arms he found her, for having attempted to rob him of his natural property. Douglas beheld himself for a moment, and calling upon his men to close all round him and the lady, began to move away with his belated burden, while the old gentleman loaded the air with his cries, and struggled

forward with the vain intention of rescuing his daughter. The lover might soon have succeeded in his wishes by ordering the remonstrant to be withheld, and taken home by his men; but he speedily found that to take away his mistress in her present condition, and without the means of immediately relieving her, would be the height of cruelty; and he therefore felt himself reluctantly compelled to resign her to the charge of her parent, even at the risk of losing her for ever. Old Mr Lindsay, overjoyed at this resolution, offered to take his daughter into his own arms, and transport her back to the house; but Douglas, heeding not his proposal, and apparently anxious to retain his mistress as long as he could, saved him this trouble by slowly and mournfully retracing his steps, and carrying her up stairs to her bed-chamber—his company meanwhile remaining below. He there discovered that Helen had been locked up by her father, who had found reason to suspect her intention of eloping, and that this was what occasioned her departure from the mode of escape previously agreed upon. After depositing her still inanimate person carefully on a bed, he turned for a moment towards her father; told him fiercely, that if he exercised any cruelty upon her in consequence of what had taken place, he should dearly rue it; and then, after taking another silent, lingering, farewell look of his mistress, left the house in order to continue his march.

After this, another and longer interval occurs between the incidents of our tale; and this may perhaps be profitably employed in illustrating a few of the circumstances already laid partially before the reader. William Douglas was a younger son of Sir Robert Douglas of Glenbervie, the celebrated antiquary, and had been bred to the profession of a writer, or attorney, under the auspices of a master of good practice in Aberdeen. Being, however, a youth of sanguine temperament and romantic spirit, he did not hesitate a moment, on hearing of the landing of the Chevalier, to break his apprenticeship, just on the point of expiring, and set off to rank himself under the banners of him whom he conceived entitled to the duty and assistance of all true Scotsmen. In consideration of his birth, and his connection with some of the very highest leaders in the enterprise, he was appointed aide-de-camp to the Prince, in which capacity he had been employed to communicate with the city in the manner already described. As he rode up the High Street, and, more than that, as he rode down again, he had been seen and admired by Helen Lindsay, who happened to be then in the house of a friend near the scene of his exploit. Soon after the Highland army had taken possession of the city, they had met at the house of a Jacobite aunt of the young lady, and a passion of the tenderest nature then took place between them. To her father, who was her only surviving parent, this was quite unknown till the day before the departure of the Highlanders, when some circumstances having roused his suspicions, he thought it necessary to lock her up in her own room, without, however, securing the window—that part of a house so useful and so interesting above all others to youthful lovers, the chink of Pyramus and Thisbe not excepted. It only remains to be stated, that though the young lady recovered from the effects of her fall in a few weeks, she did not so soon recover from her disappointment, and she was doomed to experience a still greater affliction in the strange look with which she was afterwards regarded by her father and all her own acquaintance.

William Douglas performed an active part in all the scenes of the rebellion, and finally escaped the perils of Culloden almost without a wound. He fled to his father's house, where he was received joyfully, and concealed for upwards of a twelvemonth, till the search of the royal troops was no longer dangerous. His father frequently entreated him to go abroad, but he would not consent to such a measure; and at last, it being understood that government had passed an "act of oblivion" in regard of the surviving rebels, he ventured gradually and cautiously to appear again in society. All this time he had never communicated with Helen Lindsay; but his thoughts had often, in the solitude of his place of hiding, turned anxiously and fondly towards her. At length, to the surprise of his father, he one day expressed his desire of going to Edinburgh, and setting up there as a writer—the profession to which he had been educated, and for which he could easily complete his qualifications. Sir Robert was by no means averse to his commencing business, but expressed his fears for the safety of his son's person in so conspicuous a situation in the capital, where the eyes of justice were constantly wide open, and where he could certainly meet with the most disagreeable recognitions. The lover overruled all these objections, by asking the old gentleman whether he would wish to see his son perish in the West Indies, or become a respectable and pacific member of society in his own country; and it was speedily arranged that both should set out for Edinburgh, in order to put the youth's purpose in execution, so soon as he should procure his indenture from his late master. In this no difficulty was experienced; and in a few weeks the aged baronet set forth, accompanied by his son on horseback, towards the city which contained all the latter held dear on earth.

On arriving at an inn in the Canongate, the first thing Sir Robert did was to send a card to his cousin, the Earl of —, informing his lordship of his arrival, and begging his company that evening at his hotel.

The earl soon made his appearance, heartily welcomed the old gentleman to Edinburgh, and was introduced to young William. His lordship was sorry, however, that he could not stay long with them, as Lady — was to have a ball that evening, where his presence was of course indispensable. He begged, however, to have the pleasure of their company at his house so soon as they could dress, when he would endeavour to entertain them, and, moreover, introduce his young kinsman to the chief beauties of Edinburgh. When he was gone, Sir Robert, alarmed at the idea of his son entering at once into an assemblage where many would remember his face, attempted to dissuade him from attending the ball, and offered to remain all the evening with him in the inn. But William insisted upon going, holding all danger light, and representing to his father, that, even though he were recognised, no one, even an enemy, would think of discovering him, that being generally held as a sin of the deepest dye. The truth was, that the earl's mention of beauties put him in mind of Miss Lindsay, and inspired him with a notion that she would be of the party, and that he might have an opportunity of renewing his acquaintance with her, which he could not easily procure otherwise. Both, therefore, prepared themselves for the ball, and in a short time set off in two chairs for Gray's Close, in which the earl's house was situated.

That fine old spacious alley was found to be on the present occasion as splendid as it was possible for any close in Auld Reekie to be, under the double advantages of fashion and festivity. Two livery-men stood at the head with torches, and served as a beacon to mark to the gathering company the entrance of the strait into which they had to steer their way. Between the head of the lane and the vestibule of his lordship's house, other servants were planted with torches, so as to form an avenue of lights, along which the guests were ushered. All the guests, as they successively arrived, were announced at the head of the stair by a servant—a custom recently adopted from London, and of little service in Edinburgh, where all people knew each other by sight. It served, however, on the present occasion, to procure for Sir Robert and his son, immediately on their entering the room, a general and instantaneous attention, which they would rather have dispensed with, and upon which they had not calculated. Both gentlemen were personally presented by their kinsman, the earl, to many persons of distinction of both sexes, among whom Sir Robert (though he had been for twenty years estranged in a great measure from society, in the prosecution of his studies, and the management of his gout) soon recognised and entered into conversation with some old friends, while his son set himself to observe if Miss Lindsay was in the room. She was not present; but as company continued still to arrive, he entertained hopes that she would yet make her appearance. Disengaging himself, therefore, from his father, he withdrew to a corner of the room, where he might see, without being easily perceived by any person entering; and there, in silence and abstraction, he awaited her probable arrival. Some minutes had elapsed after the last announcement, and in the idea that all were assembled, the earl had stood up at the head of a long double line of powdered beaux, and ladies with enormous hoops and high head-dresses, in order to lead off the first dance, when William Douglas heard the name of Mr and Miss Lindsay proclaimed at the head of the stair, and presently after saw an old precise-looking gentleman lead into the room the elegant figure of his long-lost mistress. He saw no more for some time; for while his blood rushed upwards to the heart in tumultuous tide, a dimness came over his eyes, and obscured even the brilliant chandeliers that hung over the company. On recovering his powers of observation, the dance was done, and the floor cleared of its revellers, who now sat all round in full view. Some of the ladies were fanning themselves vehemently with their large Indian fans; others were listening, with head awry, to the compliments of their partners; not a few were talking and coquetting with the gentlemen near them, and a great portion were sitting demurely and stiffly in groups, like hedgerow elms, under the awful patronage of their mothers or protectresses: all were companionable and looked happy, except one—a silent and solitary one, who, less attractively dressed than any of the rest, yet more beautiful than them all, sat pensively apart from the throng, apparently taking little interest in what was going on. Douglas needed no one to inform him that this was Helen Lindsay, though she was very different from the vivacious sparkling girl she had been eighteen months before. He was shocked at the change he observed, and hastened to discover the cause, by inquiring of a silly-looking young man near him who she was. "Oh! that is Miss Lindsay," quoth the youth, who was no other than her ancient admirer, Claver, "said to be the prettiest girl in Edinburgh, though Miss Pringle for my money—her you see with a flame-coloured sack, sitting next to the Lord Justice Clerk. To be sure, Miss Lindsay is not what she has been; I was once thought in love with her [here he simpered], but she was one morning found on the tramp with a rebel officer, who is said to have been hanged, and she has never since then held up her head as she used to do; for indeed, let me tell you, some of our great dames here affect to hold up their noses at her adventures; so that, what with a lippit character, and a banged sweetheart, you see she looks somewhat dismal on it."

Douglas durst make no further inquiries, but shrunk back in the seclusion and concealment afforded by a corner of the room, from whence he continued for some time longer to watch his unhappy mistress, his father in the meantime completely taken off his hands by a spectacled old maiden of quality, who had engaged him in a genealogical disquisition. By watching his opportunities, he contrived to place himself almost close beside his mistress, without being observed, and, gradually making still nearer approaches, he had at last the happiness of finding himself upon the very next seat to hers. Whatever change disappointment and woe had wrought in her, it did not amount to a fourth of that which William had achieved in himself by a change of clothes, and taming down, to the expression of domestic life, a visage which had showed somewhat fierce and soldierly in the days of his acquaintance with Miss Lindsay. Instead of his former gallant and robust air, he was now pale and elegant, and though his eye still retained some of its fire, and his lip its wonted curve, the general change was such, and, moreover, the circumstances under which he was now seen were so different from those which surrounded and characterised him, that before any but a lover's eye he might have passed without recognition. As the case was, Miss Lindsay discovered him at the first glance, and with difficulty suppressing a scream, had nearly fainted with excessive emotion. In the words of Scotland's national poet,

She gazed, she reddened like a rose,
Syne pale as any lily.

But she expressed no farther emotion. With presence of mind which was not singular in those times of danger, she instantly recovered her tranquillity, though her eyes could not but express that she half believed herself to be in the presence of a being out of this world. One affectionate look from William sufficed to put her alarm on that score to rest; but she continued to feel the utmost apprehension respecting his safety, as well as a multitude of other confused emotions, which fast awakened in her heart, as from his imaginary grave, where they had long been buried, and thronged tumultuously through her breast. A few words, heard by no ears but hers, stealing under cover of the noise made by the music and the dancers, like the rill under a load of snow, conveyed to her the delightful intelligence that he was still alive and her lover, and that he was come thus late, when the days of peril seemed past, and under happier auspices than before, to claim her affections. When the dancers next arose upon the floor, he respectfully presented his hand, and led her, nothing loth, into the midst of the splendid assemblage, where Lord —, bustling about as master of the ceremonies, assigned them an honourable place, in spite of the surprised looks and reprobatory winks of not a few matrons as well as young ladies. The handsome and well-matched pair acquitted themselves to the admiration of the whole assemblage, except the censorious and the envious; and when they sat down together upon the same seats from which they had risen, the speculation excited among the whole throng by the unexpected appearance of such a pair, was beyond all precedent in the annals of gossip.

Not long after, supper was announced, and the company left the dancing-room in order to go down stairs to the apartment where that meal was laid out. A ludicrous circumstance now occurred, which we shall relate, rather because it formed a part of the story, as told by our informant, than from any connection it has with the main incident.

Sir Robert had all this time been so earnestly engaged in the genealogical discussion alluded to, that, interesting as the word supper always is on such occasions to those not given to dancing alone, he did not hear it. It was not till all were gone that he and the old spectacled lady discovered at what stage of the proceedings they were arrived. Recollecting his old-fashioned politeness, however, in proper time, the venerable antiquary made his *congé*, and offered his hand to the tall, stiff, and rigid-looking dame, in order to escort her, *more majorem*, down stairs. Sir Robert was a man somewhat of the shortest, and, moreover, of the fattest, while a gouty foot, carefully swaddled, gave an infirm and tottering air to his whole person. As they moved along, the two antiques would have reminded one of Sancho Panza leading the distressed old spectacled duenna through the dark labyrinths of the duke's castle. Thus they went along the room, down the earl's narrow spiral stair, and through an ill-lighted passage, he cringing and limping, as gouty men are wont, and she sailing along, erect and dignified after the manner of an old maid of 1750, who had seen good company at the hunters' balls in Holyrood-house. Now, it so happened that a servant, or, as some editions have it, a baker, had set down a small fruit patty, contained in an oval dish, in a dark corner of the passage, intending immediately to return from the supper-room, to which he had carried some other dishes, in order to rescue it from that dangerous situation—to which, indeed, he had been compelled to consign it, on finding that his hands were already over-engaged. Before he returned, as ill luck would have it, Sir Robert's gouty and clumy foot alighted full in the middle of the patty, and stuck in it up to the ankle—perfectly unconscious, however, in its swaddings, of having so shod itself, so that the good baronet walked on with it into the room. What was his surprise, and what the mirth of the company, and what the indignation of the old duenna, on finding

that she shared in the ridicule of her esquire, may perhaps be imagined, but cannot be adequately described. Suffice it to say, that the whole assemblage were so delighted with the amusing incident, that not one face exhibited any thing of gloom during the subsequent part of the evening; and even the young ladies were tempted to forget and forgive the good fortune of Miss Lindsay, in having to all appearance so completely secured a first-rate lover.

Our tale now draws to a conclusion, and may be summed up in a few words. William Douglas soon settled in business as a writer to the signet, and found no obstacle on the part of either his parent or his mistress in uniting himself to that amiable young lady. It was known to a few, and suspected by more, that, under the decent habit he now wore, was concealed the very person who knocked down two of Gardner's dragoons in the Luckenbooths, and braved all Edinburgh to single combat. But he was never molested on this account; and he therefore continued to practise in the Court of Session for upwards of half a century, with the success and with the credit of a respectable citizen.

ORIGIN AND PROGRESS OF THE ART OF PRINTING.

HAVING, in the first article on this subject, mentioned that the earliest specimens of printing which have been discovered, consist in the stamped marks on the bricks and tiles used in building the city and tower of Babel, and which may be dated 2200 years before Christ, I now proceed to detail the various stages of improvement in this noble art. Before, however, leaving this early branch of the subject, I may notice, that a number of the stamped clay materials of Babel are still preserved in the repositories of antiquity. It is remarked, that they generally differ in shape and appearance, and that the letters, or words, which are in an ancient character, seem to have been stamped by the hand by moveable blocks. In Trinity College, Cambridge, some curious specimens are preserved, one of which is a round piece of clay, seven inches in height, and three inches in thickness at the ends, resembling a barrel, or a lady's ball of thread in shape, being thickest at the middle. This interesting relic—this Chaldean book—is entirely covered with lines of letters and words running from the one end to the other; from its portable character, it may be called a *pocket volume*, and one which cannot be less than 4000 years old. The greatest possible care is taken of this precious relic of antiquity. It is mounted on a marble pedestal, covered with a glass case secured by an iron bracket, and so contrived that the curious inspector may cause it to revolve on its marble base. It appears to have been printed by two moulds, and at the middle of the circumference a small blank space has been left, in case, as it is supposed, room should be required for a portion of the clay to escape in the action of compression.

Next to these extremely ancient stamped bricks, in point of interest and antiquity, are the specimens now shown of the earliest engraving of letters on stone. It has been signified by various writers, that Cadmus, a Phœnician who lived 1500 years before Christ, at a period contemporary with Moses, and who has been esteemed the builder of the city of Thebes, was the first who taught the Greeks the use of alphabetic symbols, an art he most likely learned from the Hebrews. The most ancient specimen of an engraved inscription now known to be extant, is the Sigeian Inscription, so called from having been disinterred upon a promontory named *Sigium*, situate near the ancient city of Troy in Greece. It is engraved on a pillar of beautifully white marble, nine feet high, two feet broad, and eight inches thick, and which, from the inscription, served as the pedestal for the heathen god Heracles. The letters used in this inscription are the capitals of the Grecian language, though rudely cut, but read from right to left like the Hebrew. This specimen of engraving must be about 3000 years old.

Another not less interesting relic of the earliest stage of printing is found in a Roman signet ring, or stamp, approaching in character to that species of stamp now used by the Post Office on letters. A not very dissimilar stamp in the Greek character is in the possession of the Antiquarian Society of Newcastle-upon-Tyne.

It will be perceived, that, however curious these relics of literature may be, they do not bear any connection with the art of printing books. The origin of this invention seems to be quite independent of a preceding knowledge of impressing by means of stamps. What is, however, worthy of remark, the art of printing books, though on a rude principle, was known and in use among the Chinese at least fourteen hundred years before it was invented in Europe. The printing of the Chinese has never resembled any thing of the kind in this country. From the first, it has been conducted without moveable types. Each page has been, and continues to be, a block or cut stamp, which is thus useful only for one subject, so that every book must have its own blocks. No press is used. The paper being thin, when laid on the block, receives the impression by being smoothed over with a brush. There is reason to infer that the art of printing, as thus practised by the Chinese, may have originated through a knowledge of the still more ancient Chaldean mode of printing by blocks on clay.—*To be continued.*

DAMASCUS.

J. S. BUCKINGHAM, whose enterprising travels in divers eastern countries are well known and esteemed for the valuable and correct information which they afford, both as regards the most interesting relics of antiquity, and the mercantile character and capacities of various half-civilised nations, presents the following view of the trade and other peculiarities of the city of Damascus, in his travels among the Arab tribes, which will be appreciated by intelligent inquirers after facts of this useful nature:—

"The narrowest streets of Damascus are wider than the generality of those at Cairo, and will conveniently admit of a laden camel marching in the centre, with room for a foot passenger to move in safety on each side. The greater number of the streets, indeed, would allow two laden camels to pass each other without incommencing those on foot; and many are as wide as the great street by which we first traversed Damascus, on entering it from the southward, as before described. The bazaars are appropriated each to the sale of its separate class of articles, which is usual, indeed, throughout the Turkish dominions. Those in which the more valuable commodities are vended, are generally roofed in, with apertures left to admit light and air, by which means they are kept warm and dry in winter, and shady and cool in summer—considerations of importance to places so constantly thronged as are these resorts of purchase and sale. The bazaars appeared to us to be all well furnished with the articles of commerce in general requisition here, and the traders seemed to be more wealthy and respectable than the same class of persons in Egypt. The shops are seldom opened before ten o'clock in the forenoon, and rarely continue open longer than two o'clock in the afternoon, making their period of business, therefore, only four hours in the day. The persons who attend in them to serve the customers, under the eye of the master, are well dressed, obliging, and polite, and generally succeed, by their complimentary mode of address and agreeable manners, in inducing their visitors to purchase more of them than they at first intended. On the whole, there is perhaps no part of a modern Turkish or Arabian city where the pictures of the Arabian tales pass so frequently and completely before the view as in a crowded bazaar; and to an observant spectator, it is one of the most agreeable and entertaining rambles that he can take.

In Damascus, all kinds of Indian commodities—but particularly spices, cotton manufactures, coarse and fine muslins, chintzes, and gold stuffs—are in great demand, and considerable quantities of them are sold at high prices. These come from India by the Persian Gulf, Bussora, Bagdad, and Aleppo, and are consequently burdened with all the heavy expenses of land carriage through such a circuitous route. It is here, among other great cities of the Levant, including Constantinople, Smyrna, and the whole of Asia Minor, that a vast field would be found for the consumption of Indian commodities, if they could be brought to their respective markets at a less cost, and rendered available to all classes, instead of being confined, as they now are by their heavy prices, to the opulent only.

The few manufactures of England that have yet found their way into the bazaars of Damascus, are much sought after, and held in very high esteem, particularly light woollen clothes of gay colours, printed cottons and chintzes, and silk and cotton shawls made in imitation of those of Cashmere. As these are not imported direct from England to Syria, but come through the markets of Malta, Smyrna, the Greek Islands, and Alexandria, at each of which places the prices become enhanced by new charges, they sell here at exorbitantly high rates, and would very handsomely repay the adventurer of a small ship freighted with such a cargo, to be landed at some port on the coast. To these, however, might be added a considerable number of other articles, which from the cheap rate at which they could be furnished from England, would only need be known, to be in great demand.

The great supply of wearing apparel for the fashionable persons of both sexes at Damascus, is brought from Constantinople, ready made. These are mostly new, but a large quantity of clothes that have been previously worn are also brought from the Turkish capital for the bazaars of this city, and distributed indeed over the greater part of the empire.

Among other various manufactures to be found in the bazaars of Damascus are very superb caparisons for horses, of which the Turks, and indeed all the eastern nations, are extremely fond. The best of these are considered to be made in Roomeelea, by which the people here generally understand European Turkey; a number of fine bridles, martingales, and silver and embossed breast-pieces, come also from Persia. The fire-arms are chiefly of French and German manufacture, but got up in a more highly ornamented style than would be pleasing to European taste, being expressly prepared for this market. Those who are the most choice, however, in the selection of their arms, prefer to have the barrels of their muskets and pistols made of the old wavy iron found in the ancient sword-blades of the country, with French or German ornaments, but with English locks. The sabre blades are almost all of the old Persian or Damascus manufacture, the art of making them being no longer known or practised in this city.

The silk seen in the bazaars of Damascus is principally of Chinese and Indian manufacture; the furs come from Russia, Georgia, Circassia, and Armenia; the velvet from Italy; copper from Asia Minor; lead, tin, and iron, from England, through Smyrna; and various other articles of an inferior kind from Germany and France. The domestic manufactures of Damascus are very few, and consist chiefly in silk stuffs, plain, coloured, and embroidered with gold; fabrics of plain cotton, and cotton and silk mixed, all for home consumption, and mostly of broad striped or wavy patterns for the caftans of the Turkish dress. They are as well made as they could be of the same materials in any part of Europe—England and France perhaps excepted; and as far as I could learn, the manufacture was neither slow, intricate, nor expensive. They are worn by persons of the highest rank in the city, while their moderate price and great durability render them also in great request among the middle ranks of society. Besides the roofed bazaars, in which the articles enumerated are generally found, there are also open bazaars in which household furniture and wearing apparel, both old and new, are sold by public auction."

THE FRENCH AND BRITISH DRAMA.

THE drama in France, as well as in our own country, seems at present rather at a discount. Nor is this to be wondered at; for, independently of the fact, that for some time past nothing very brilliant or striking in that department has appeared, the real drama of life which has been exhibited there for the last twelve months, so far exceeds, in variety and intensity of interest, any thing which the mimic representations of the stage could offer; its scenes have been so much more striking, its changes so much more unexpected, and its *dénouement* is yet so impenetrable, that reality seems suddenly to have assumed the romance and mystery of the stage, and the stage itself to have become the last representation of the sobriety, and even tenor, which used to be the attributes of common life.

The dramatic talent of the day, such as it is, our readers are probably aware, has latterly taken the direction of illustrating the early history of France. The modern dramatists are busily employed in exploring a mine, which in this country is pretty well worked out, endeavouring to do for their country what Shakspeare has done for the civil wars of England, and Scott for the times of chivalry, though in a spirit abundantly different from either of their prototypes. Shakspeare, conversant with every form of life, and, therefore, tolerant of all opinions, has no theory to favour—no peculiar views of society and polity to enforce or assail. Good and evil, virtue and vice, happiness and misery, are to him necessary fragments of one grand picture; in the darkest scenes of bloodshed and strife, through which he moves, he sees some gleam of humanity enlightening the gloom; in the sunniest spots of life, some lurking and melancholy shadows; while, even amidst the tempest and the whirlwind of warring passions, there are pauses in which, ever and anon, are heard the still, small whispers of serenity and peace. This versatility of mind in Shakspeare, which enables him, like the universal sun, to look placidly on all things, was favoured by the character of the period in which he lived. Those were the days of action, not of thought. The great questions which have since divided and are now agitating the world, slept unheard of in the womb of time. Opinions had not assumed consistency or form, far less arrayed themselves in hostile opposition to each other. The strong prejudices and clashing opinions of later centuries had not taught men to view the past through a distorted or a partial medium, or to seek in the fictitious representations of former days a vehicle by which their opinions on questions of government or morals might be insinuated, or the prevailing views and passions of the day flattered or confirmed.

Those days of indifference, however, are gone by. The great questions which were unheard of in the sixteenth century have since been proposed and discussed with vehemence by divided senates and contending armies. Our great novelist views the past with a kindly feeling, because a reverence for antiquity in all things is one of those principles which he carries into the actual business and duties of life. Thus he spreads a glow over all his pictures of former days, brings forward into sunshine the splendours of the tilt-yard and the banquet, while he hides "the loop-hole grates where captives weep;" and dilates with complacency on individual instances of the bravery, courtesy, loyalty, and constant service of the antique world, while he passes over its too general selfishness, misery, and crime.

The very opposite view, and one at least as exaggerated, is taken, as might be expected, by the modern dramatists of France, who, while they have borrowed from Sir Walter Scott the hint of dressing up for modern purposes their ancient annals, have treated him much in the same way as Caliban does Prospero, after he has bestowed on him the gift of language—they turn his materials against himself, and use them only to degrade that state of society which he has painted in colours so seductive. This, then, is the leading fault of the modern French dramatists, in their sketching from the earlier annals of France—the colour is too uniformly sombre and gloomy.

The editor of the Journal has extracted the above

judicious observations from an able article in the *Foreign Quarterly Review* for January 1832, a work which may be esteemed as one of the best and least somnolent of the quarterly periodicals. He may be permitted the concluding remark, that the decline of the drama in Britain, where it is more sensibly observed than on the Continent, has doubtless been effected by the almost total want of sympathy which prevails betwixt the minds and actions of the people generally, and those illustrated on the stage, where life is uniformly painted in false or illusive colours, or in a fantastic form. To the exceedingly imperfect admonitions and amusements of the drama have succeeded, it is to be hoped, a more rational mode of instruction in morals, and a more innocent order of entertainments.

BIOGRAPHIC SKETCHES.

DR ALEX. MURRAY—concluded.

"ABOUT WHITSUNDAY 1791," continues Dr Murray, "I returned to school, able to read Eutropius, Ovid, Caesar, and Ruddiman's Grammar, in an intelligent but not very correct style. I certainly knew a great deal of words and matters, but my prosody was bad, and my English not fluent nor elegant. I found the young class reading Ovid and Caesar, and afterwards Virgil. I laughed at the difficulty with which they prepared their lessons, and often obliged them by reading them over, to assist the work of preparation. My kind master never proposed that I should join them. He knew, indeed, that my time at school was uncertain; and he not only remitted a great part of my fees, but allowed me to read any book which I pleased. I studied his humour, and listened to his stories about his college life in the University of Aberdeen, where he had been regularly bred, and where he had been the class-fellow of Dr Beattie.

I found my school-fellow, Robert Cooper, reading Livy, the Greek Grammar, and the Greek New Testament. A few days before going to school this season, I had formed an acquaintance with John Hunter, a miner, under Mr George Muir, and who lived in the High Row of the Miners' Village, at Mr Heron's lead-mines. This man and his family had come from Leadhills. He showed me many civilities, and gave me the use of the following books, that had belonged to a brother of his, then deceased: Luciana, Dialogi, cum Tabula Cebetis, Greek and Latin; a Greek New Testament; Homer's Iliad, Greek and Latin, in two small volumes; Buchanan's Historia Rerum Gest. Scoticarum; and Buchanan's Opera Poetica. The first portion of my wages had gone to Dumfries or Edinburgh to buy Moore's Greek Grammar and Schrevelius' Lexicon. I got the Grammar, but I forget how I obtained the Lexicon. My master allowed me to pass over Caesar, Ovid, Virgil, and Sallust, of which last, however, I borrowed copies, and read them privately, or at times with the young class. Dr George Muir was one of the young class, and my intimate friend. After I had read my own lessons, I almost always read along with him his lesson in Virgil and Sallust. But Mr Crumond permitted me to read Livy along with Robert Cooper, and Buchanan's History by myself. Robert Cooper was indolent, and I was proud to see that I had overtaken him, and could repeat Greek Grammar and read Greek in the New Testament with more ease. He was given to law, but I joined in no sports, but sat all day in the school. My amusement consisted in reading the books of history and poetry brought to school by the other scholars. At home I attacked Homer, and attempted to translate him by the help of the Latin translation. In June 1791, we were allowed to read a daily lesson in the first book and volume of the Iliad, which we prepared in the school. But I kept the second volume at home, and pored on it, till I fairly became, in an incorrect way, master of the sense, and was delighted with it. I remember that the fate of Hector and Sarpedon affected me greatly; and no sensation was ever more lively than what I felt on first reading the passage which declares that 'Jupiter rained drops of blood on the ground, in honour of his son Sarpedon, who was to fall far from his country.' My practice was to lay down a new and difficult book, after it had wearied me; to take up another—then a third—and to resume this rotation frequently and laboriously. I always strove to seize the sense; but when I supposed that I had succeeded, I did not weary myself with analysing every sentence. About that time I formed a sort of axiom, that every language must have a certain number of words, and that in learning a language, the student is not master of it till he have seen all these. I therefore always liked to turn over dictionaries, as well as to read authors.

In July 1791, I found my Greek knowledge increase. I began to translate sentences into Greek, by help of certain phrases at the end of Schrevelius. And so far as I remember, I, during that summer or autumn, attempted to introduce myself to your notice, by letters in Greek and Latin. The Greek one was short, and no doubt very inaccurate likewise, but less exceptionable. From that time you began to give me the use of books, and good advice as to my future behaviour and studies, which in my situation were very desirable. I had from you the loan of Longinus—the *Œdipus Tyrannus*—a volume of Cicero's Orations, which I read with great delight—and some others. All that summer and harvest were devoted to hard and continued reading, which was not limited to works

in Greek and Latin, but extended to the history and poetry in the several books. I carried Homer in my pocket abroad, and studied him with great diligence.

I had long possessed the Hebrew letters, and knew the meanings of many words. I was now determined to learn that language. I sent for a Hebrew Grammar to Edinburgh, by the man who rode post. He brought me Robertson's Grammar, and the first edition of that book, which contains the Arabic alphabet in the last leaf. Mr Crumond, to whom I showed it, in September 1791, at the time when I received it, informed me that he once was able to read Hebrew, but that he had now forgotten it entirely. I had for a long time known the alphabet; I found the Latin easy and intelligible; I soon mastered the points; and, in the course of a month, got into the whole system of Jewish grammar. On an accidental visit to New Galloway, I was told by John Heron, a cousin of mine, and father to Robert Heron, author of several works, that he could give me a small old Lexicon belonging to his son. This present was to me astonishingly agreeable. It contained, besides the words and their Latin interpretations, the book of Ruth in the original. When I came home, some person informed me that a relation of Mr Wilson's, in Auchinleck, then living in Minigaff village, had in her possession a Hebrew bible, the property of her brother, Mr William Wilson, a dissenting clergyman in Ireland. She consented to let me have the use of it for several months. It was a small edition in several volumes, I forget from which press. I made good use of this loan; I read it throughout, and many passages and books of it a number of times.

I returned to school in summer 1792, and read Latin and Greek, rather for practice than in a rudimentary way. The fault of our teacher was a slovenly inattention to grammatical minutiae, which hurt my future appearance at college, and is more or less the evil of all country schools. In return for this, he was kind, familiar, and communicative. His foible was the love of drink. He had nobody to prepare a comfortable meal for him in his little way, and he went to the alehouse in order to avoid the wearisomeness and inattention which distressed him at home. You know he at length became unfit for any public situation. Yet, had I been placed under a more formal and regular master, I should never have been able to make a respectable progress; for the broken state of my time would have compelled me to wait on children in low and young classes, in order to get by memory every part of the Rudiments; and every absent winter, and inaccuracy in reading, would have been a pretext for beginning me anew in the Rudiments and Grammar. All the accurate men have this way of thinking. Mr Dalzel, the professor of Greek, rebuked me severely for looking into Plato and Aristophanes in my first year at college. I received his admonitions, but still persisted in reading those writers. Desultory study is no doubt a bad thing; but a lad whose ambition never ceases, but stimulates him incessantly, enlarges his mind and range of thought by excursions beyond the limits of regular forms.

In 1792, I read portions of Homer, Livy, Sallust, and any other author used in the school. In the autumn 1792, my companion, Cooper, left the school, and went, I believe, to Glasgow University. I could not imitate him, for want of funds. In the winter 1792-3, I engaged myself with Thomas Birkmyre, miller, of Minigaff Mill, and taught his children during that season till March 1793. My wages were only thirty shillings, but my object was to get a residence near Newton Stewart, and to have liberty of going, in the winter forenights, to a school taught by Mr Nathaniel Martin, in Brigend of Cree. Several young lads attended it with a view to exercise themselves in reading English poetry, and in spending their hours agreeably. Martin had been at Edinburgh, and possessed many new books, such as The Bee, Duncan's Cicero, some of the best English collections, and so forth. In the Miln, I got Gulliver's Travels and Clarke's Evidences of Christianity. I did not understand the one, nor care much for the other. My companions at the night-school were William Gifford, lately a writer's first clerk in Edinburgh; one Thomas Baird, a clerk to a tobaccoist; John Mackilwraith, son-in-law to John McKie, lately merchant in Castle Douglas. John Mackilwraith was an old friend, for his father-in-law was tenant of Kitterick in 1783. From him I got the loan of Baillie's English Dictionary, which I studied, and learned from it a vast variety of useful matters. I gained from it the Anglo-Saxon alphabet, the Anglo-Saxon paternoster, and many words in that venerable dialect.

In 1791, I had the loan of a stray volume of the Ancient Universal History from my neighbour school-fellows, the Maclurgs, who lived in Glenhoash, below Risque. It contained the history of the ancient Gauls, Germans, Abyssinians, and others. It included a very incorrect copy of the Abyssinian alphabet, which, however, I transcribed, and kept by me for future occasions. I was completely master of the Arabic alphabet, by help of Robertson's Grammar, in the end of which (first edition) it is given in the most accurate manner.

In the autumn of 1792, about the time I went to the Miln, I had, in the hour of ignorance and ambition, believed myself capable of writing an epic poem. For two years before, or rather from the time that I had met with Paradise Lost, sublime poetry was my favourite reading. Homer had encouraged this taste, and my schoolfellow, George Mure, had lent me, in

1791, an edition of Ossian's Fingal, which is in many passages a sublime and pathetic performance. I copied Fingal, as the book was lent only for four days, and carried the MS. about with me. I chose Arthur, general of the Britons, for my hero, and during the winter 1792-3 wrote several thousand of blank verses about his achievements. This was my first attempt in blank verse. In 1790, I had purchased 'The Grave,' a poem by Blair, and committed it almost entirely to memory.

I passed the summer of 1793 at home, and in long visits to my friends in Newton Stewart, and other parts. I used to live weeks with James M'Harg, and to write in company with him ridiculous burlesque poems on any subject that struck our fancy. At Newton Stewart, at that time, I read with great interest Tom Paine's works, in which M'Harg and I did not feel ourselves much concerned. We both liked liberty; but I well remember that the death of the king of France, which I read in January 1793, in a newspaper, almost made me cry; and I hated Marat and Robespierre. M'Harg had a practice of preying on the credulity of ignorant people, who were not able to read, but were keen Jacobins. He told them a world of lies about the success of the French, &c., &c., which they, with great and absurd joy, communicated to their neighbours. We both did a little too much in this wicked way, for we thought these people below par in sense. During that summer I destroyed Arthur and his Britons, and began to translate from Buchanan's poetical works, his *Frater Franciscani*. I made an attempt to obtain Mochnum school, but Mr Steven, minister of that parish, who received me very kindly, told me that it was promised, and that my youth would be objected to by the heritors and parish.

Some time in summer 1793, I formed an acquaintance with William Hume, a young lad who intended to become an Antiburgher clergyman, and who kept a private school in Newton Stewart. About the same time you introduced me to several members of the presbytery of Wigton. My friendship with Mr Hume procured me the loan of several new books. I paid a visit to Mr Doman, in Wigton, an excellent man and scholar. He examined me on Homer, which I read *ad aperitum libri* in a very tolerable though not very correct manner. He gave me Cicero, *de Naturâ Deorum*, which I studied with great ardour, though a speculative treatise. I was enthusiastically fond of Cicero, as my dictionary gave me a most affecting account of the merits and fate of that great man. In 1791, I bought for a trifle a MS. volume of the lectures of Arnold Drackenburgh, a German professor, on the lives and writings of the Roman authors, from Lilius Andronicus to Quintilian. This was a learned work, and I resolved to translate and publish it. I remained at home during the winter of 1793-4, and employed myself in that task. My translation was neither elegant nor correct. My taste was improving; but a knowledge of elegant phraseology and correct diction cannot be acquired without some acquaintance with the world, and with the human character in its polished state. The most obscure and uninteresting parts of the Spectator, World, Guardian, and Pope's Works, were those that described life and manners. The parts of those works which I then read with rapture, were accounts of tragic occurrences of great but unfortunate men, and poetry that addressed the passions. In spring 1794, I got a reading of Blair's Lectures. The book was lent by Mr Strang, a relief clergyman, to William Hume, and sub-lent to me. In 1793, I had seen a volume of an Encyclopædia, but found very considerable difficulties in making out the sense of obscure scientific terms, with which those books abound.

Early in 1794, I resolved to go to Dumfries, and present my translation to the booksellers there. As I had doubt respecting the success of a History of the Latin Writers, I likewise composed a number of poems, chiefly in the Scottish dialect, and most of them very indifferent. I went to Dumfries in June 1794, and found that neither of the two booksellers there would undertake to publish my translation; but I got a number of subscription papers printed, in order to promote the publication of the poems. I collected by myself and friends four or five hundred subscriptions. At Gatehouse, a merchant there, an old friend, gave me a very curious and large printed copy of the Pentateuch, which had belonged to the celebrated Andrew Melvin, and the Hebrew Dictionary of Pagninus, a huge folio. During the visit to Dumfries I was introduced to Robert Burns, who treated me with great kindness; told me, that if I could get out to college without publishing my poems, it would be better, as my taste was young and not formed, and I would be ashamed of my productions when I could write and judge better. I understood this, and resolved to make publication my last resource. In Dumfries I bought six or seven plays of Shakspeare, and never read any thing, except Milton, with more rapture and enthusiasm. I had seen his poems before.

During this summer, my friend M'Harg was in Edinburgh, employed as a hawker, or itinerant dealer in tea, &c. He described my situation to James Kinneir, a journeyman printer, a very respectable man, who informed him, that if I could be brought into town, Dr Baird and several other gentlemen would take notice of me. I communicated this to you—you countenanced the measure, and, in consequence, I arrived in Edinburgh, beginning of Nov. 1794."

Such is Dr Murray's singular narrative, on which any comment would but weaken the impression which it is calculated to convey. On his arrival in Edinburgh, we proceed to state, he was kindly received by Mr Kinnear. The only letter of introduction which he brought to town, was one from Mr Maitland to Dr Baird, who received him with great kindness. Too much praise cannot be paid to these two gentlemen for their generous conduct, particularly as they were strangers to each other, and were actuated solely by the motive of bringing into notice indigent merit, and opening to a young man of extraordinary promise a wider field for the cultivation of his genius and talents. Nor was Murray unworthy of the patronage of these respectable individuals. On the first day after his arrival in town, he underwent an examination in presence of Dr Baird, Dr Finlayson, and Dr Moodie; and, to use the language of one of his examiners, he read *ad aperturam libri*, and also explained and analysed accurately a passage of French, an ode of Horace, a page of Homer, and a Hebrew psalm. In consequence of his uncommon acquirements, not only the direct advantages of the college were procured to him without expense, but such pecuniary aid was extended to him as was necessary for the effectual prosecution of his studies. At the end of two years he obtained a bursary from the town; and about that time he began to support himself by carrying on private teaching. Dr Baird continued through life his faithful friend and patron.—*Murray's Literary History of Galloway, second edition.*

[Dr Murray, after this period, prosecuted a successful career as a man of letters. In 1806, he undertook the ministerial charge of the parish of Urr, in his native county, which he resigned in 1812, on being appointed Professor of Oriental languages at Edinburgh. Unfortunately, the weakly constitution of this extraordinary genius sank under the fatigues of his first session, and he died universally and deeply lamented, April 15, 1813.]

DR CHALMERS'S PRAYER ON THE PESTILENCE.

"Do thou, O Lord, ward off from us the farther inroads of that desolating plague, which, in its mysterious progress over the face of the earth, has made such fearful ravages among the families of other lands. Hitherto, O God! thou hast dealt mildly and mercifully with the city of our own habitation. Do thou pour out the spirit of grace and supplication upon its inhabitants, and spare them, if it be thy blessed will, the inflictions of that wrath which is so rightfully due to a careless and ungodly generation. We pray, O Lord! in a more especial manner, for those patriotic men whose duty calls them to a personal encounter with this calamity; and who, braving all the hazards of infection, may be said to stand between the living and the dead. Save them from the attacks of disease—save them from the obloquies of misconception and prejudice—and may they have the blessings and acknowledgements of a grateful community to encourage them in their labours. Above all, we pray, O God! that the infidelity which places all its reliance on secondary causes, may never sway either the councils of this city or the councils of this nation. May there, at all times, be the public recognition of a God in the midst of us. And let not the defiance or the levity of irreligious men ever tempt us to forget that mighty unseen Being, who has all the forces of Nature at His command—who sits behind the elements that he has formed—and gives birth, and movement, and continuance, to all things."—*Edinburgh Advertiser.*

RULES OF GOOD BREEDING.

A German prince, who has recently published his Tour through Great Britain, informs us that the three following are the greatest offences which any one can commit against English manners:—"To put his knife to his mouth instead of his fork; to take up sugar or asparagus with his fingers; or, above all, to spit any where in a room. These are certainly landable prohibitions, and well-bred people of all countries avoid such practices—though even on these points manners alter greatly; for Marshal Richelieu detected an adventurer, who passed himself off for a man of rank, by the single circumstance of his taking up olives with his fork, and not with his fingers. The ridiculous thing is the amazing importance which is here attached to them. The last-named crime is so pedantically proscribed in England, that you might seek through all London in vain to find such a piece of furniture as a spitting-box. A Dutchman, who was very uncomfortable for the want of one, declared, with great indignation, that an Englishman's only spitting-box was his stomach. These things are, I repeat, more than trivial; but the most important rules of behaviour in foreign countries almost always regard trivialities. Had I, for example, to give a few universal rules to a young traveller, I should seriously counsel him thus:—In Naples, treat the people brutally; in Rome, be natural; in Austria, don't talk politics; in France, give yourself no airs; in Germany, a great many; and in England, don't spit. With these rules the young man would get on very well."

SANDY WOOD'S PLAN OF SUPPORTING A WIFE.

The eccentric and well-remembered Sandy Wood, an eminent surgeon in Edinburgh, at the outset of his professional career, married Miss Veronica Chalmers, second daughter of George Chalmers, W. S., a highly respectable man, and to whose honesty and integrity his fellow-citizens bore the most ample testimony,

by giving him the popular title of "Honest George Chalmers." This marriage turned out very fortunate for both parties, though, before it took place, there was a danger of it being impeded by the poverty of the intended husband. It is related that Mr Wood, on obtaining the consent of the lady, proposed himself to Mr Chalmers as his son-in-law, when that gentleman addressed him thus:—"Sandy, I have not the smallest objection to you; but I myself am not rich, and should therefore like to know how you are to support a wife and family." Mr Wood, putting his hand in his pocket, and taking out his lancet-case, with a scarlet garter rolled round it, presenting it to him, said, "I have nothing but this, sir, and a determination to use my best endeavours to succeed in my profession." Mr Chalmers was so struck with this straightforward and honest reply, that he instantly exclaimed, "Veronica is yours."

INOCULATING CHEESE.

What will the ingenuity of man not contrive? A method has been discovered of inoculating cheese, or, in other words, of transposing the character of an old cheese into a new one. This rather curious scheme is brought forward as a communication to the Agricultural Journal for March, by John Robinson, Esq., Secretary of the Royal Society of Edinburgh. "If it be required," says he, "to communicate to a new cheese the flavour and appearance of an old one, it may be done by the insertion in the new cheese of portions of the old one containing blue mould. The little scoop which is used in taking samples of cheese is a ready made means of performing the operation, by interchanging ten or a dozen of the rolls which it extracts, and placing them so as to disseminate the germ of the blue mould all over the cheese. A new Stilton cheese treated in this way, and well covered over from the air for a few weeks, becomes thoroughly impregnated with the mould, and generally with a flavour hardly to be distinguished from the old one. I have sometimes treated half a Lancashire cheese in this way, and have left the other half in its natural state; and have been much amused with the remarks of my friends on the striking superiority of the English over the Scotch one." If this ingenious plan be found really successful on repeated trials by others, Mr Robinson will deserve our thanks for bringing it forward. The next invention, I suppose, we shall hear of, will be that of inoculating legs of mutton, and turning them into beef!

ANGEL.

Angel, in its primitive sense, signifies a messenger, and frequently signifies men, when, from the common notion of the term, it is conceived to denote ministering spirits. Angels, as celestial intelligencers, have been the objects of over-curious inquiry and of worship. Paul says, "Let no man beguile you of your reward, in a voluntary humility, and the worshipping of angels, intruding into those things he hath not seen."—*Colossians, ix. 17.*

WHITE-HEADED SEA EAGLE.

Elevated on the high dead limb of some gigantic tree, that commands a wide view of the neighbouring shore and ocean, he seems calmly to contemplate the motions of the various feathered tribes that pursue their busy avocations below; the snow-white gulls slowly winnowing the air; the busy tringas coursing along the sand; trains of ducks streaming over the surface; silent and watchful cranes, intent and wading; clamorous crows, and all the winged multitudes that subsist by the bounty of this vast liquid magazine of nature. High over all these hovers one whose action instantly arrests his attention. By his wide curvature of wing, and sudden suspension in the air, he knows him to be the fish-hawk, settling over some devoted victim of the deep. His eye kindles at the sight; and, balancing himself with half-opened wings on the branch, he watches the result. Down, rapid as an arrow from heaven, descends the distant object of his attention—the roar of its wings reaching the ear as it disappears in the deep, making the surges foam around! At this moment the eager looks of the eagle are all ardour; and, levelling his neck for flight, he sees the fish-hawk once more emerge, struggling with his prey, and mounting in the air with screams of exultation. These are the signals for our hero, who, launching into the air, instantly gives chase, soon gains on the fish-hawk; each exerts his utmost to mount above the other, displaying, in these rencontres, the most elegant and sublime aerial evolutions. The unencumbered eagle rapidly advances, and is just on the point of reaching his opponent, when, with a sudden scream, probably of despair and honest execration, the latter drops his fish; the eagle, poisoning himself for a moment, as if to take a more certain aim, descends like a whirlwind, snatches it in his grasp ere it reaches the water, and bears his ill-gotten booty silently away to the woods.—*Wilson's American Ornithology.*

BEARS OF THE ANDES.

There are two species of bear in Colombia; one quite black, which appears to be somewhat rare, the other with a white forehead. At a certain height in the central Cordillera, I found, at every step, traces of these bears. It would appear that in the western Cordillera, this bear is much more numerous than in the other. I observed at Bogota a young bear of the white-fronted species, which had been taken soon after birth. At the age of nine months, the spot in the form of the letter Y, which characterises this

species, was only beginning to appear. Up to this age the animal had lived solely upon fruits, roots, and bread, refusing the raw or boiled flesh that was presented to it. One day I threw it a *Vultur papa*, which, having been struck in the air by another bird, had fallen in the town in a state of insensibility, and afterwards died. At first the bear was much frightened, and was nearly two hours before he ventured to go near it. At length he went up and smelled it, seemed disposed to play with it, and carried it off to the most retired corner of a dark room. When I went up, as if to take the bird from him, he drew it away, and uttered an angry cry, which I had never heard from him before, even when most tormented. From this moment he became savage, and I soon learned that it had become necessary to kill him.—*M. Routin, Ann. des Sc. Nat.*

BYRON ON THE IMMORTALITY OF THE SOUL.

"Of the immortality of the soul," says Lord Byron, in a paper written towards the termination of his life, "it appears to me that there can be little doubt, if we attend for a moment to the action of the mind: it is in perpetual activity. I used to doubt of it, but reflection has taught me better. It acts also very independent of body—in dreams for instance—incoherently and madly, I grant you, but still it is mind, and much more mind than when we are awake. Now, that this should not act separately, as well as jointly, who can pronounce? The Stoics, Epicurus, and Marcus Aurelius, call the present state 'a soul which drags a carcass,' a heavy chain, to be sure; but all chains, being material, may be shaken off. How far our future life will be individual, or, rather, how far it will resemble our present existence, is another question; but that the mind is eternal, seems as probable as that the body is not so:—but the whole thing is inscrutable."

SHOWERS OF BLOOD.

SHOWERS of liquid matter of a crimson colour, and supposed by the ignorant to be blood, have frequently spread consternation in different countries, and been deemed the presage of direful events, or the omen of the destruction of cities, and the overthrow of empires. These crimson rains have several times occurred in France, and some of my juvenile readers will remember that they form one of the phenomena illustrated by Madame de Genlis in her Tales of the Castle. From the same natural causes which produce showers of blood, there is to be found, in different parts of the earth, snow of a reddish hue, or of the finest pink or rose colour; and specimens of it have been more than once brought to England, as a curiosity for the investigation of naturalists. Coloured ice is also to be found in the polar regions, the hue it possesses being often of a fine orange appearance. To us in Scotland, or in Great Britain, who never saw or scarcely ever heard of snow or ice being any thing but of a pure white aspect, these notices may appear doubtful, yet they are quite reconcilable with facts. The cause of showers of red liquid was discovered in France upwards of two hundred years since. About the beginning of the year 1608, one of these bloody showers fell near the suburbs of Aix, and for many miles around the place; and particularly the walls of a churchyard were spotted with it. This exceedingly strange event very much alarmed the people, and would have been chronicled in history as a superstitious prodigy, had not Aix possessed at this time a philosopher, named Peirece, who, eager in the pursuit of knowledge, fell upon the cause of the shower. It is related in Gassendi's life of this ingenious man, that he was fond of the study of insects, and that, one day finding a large chrysalis of a beautiful appearance, he preserved it in a box. Some time after, hearing a noise in the box, he opened it, and found that the chrysalis had already become a butterfly, and that, in the transformation, it had left upon the bottom a stain of considerable magnitude, and apparently of exactly the same nature with the drops on the stones, popularly supposed to be blood. He now remarked, that there were countless numbers of butterflies flying about, which confirmed him in the belief of his having discovered the true cause; and this was further corroborated by his finding none of the said drops in the heart of the city, where the butterflies were rarely seen. He also remarked, that the drops were never on tiles, and seldom on the upper part of a stone—as they must have been had they fallen from the clouds—but usually appeared in cavities and parts protected by angular projections. What Peirece had thus ascertained, he lost no time in disclosing to many persons of knowledge and curiosity, who had been puzzling themselves to account for the circumstance by far-fetched reasonings, such as a supposed vapour which had carried up a supposed red earth into the air that had tinged the rain; no less wide of truth than the popular superstition which ascribed it to magic, or to the devil himself. Thus the cause of showers of blood was discovered, and any one may convince himself of the fact, by rearing any of the spinous caterpillars, which feed on the nettle, till they are transformed into the butterfly. Red and pink-coloured snow and ice are referable to the same cause. As the showers have never been seen to fall, it is correctly imagined that the infusion takes place when the snow or liquid rests on the ground or the water, or when afterwards warmed by the rays of the sun. Well may we say, How wonderful are the works of Nature!

GARDENING—MARCH.

THE present is, or ought to be, a busy season for the gardener. According to "Lindley's Guide to the Orchard and Kitchen Garden," one of the best modern works on the subject, he should finish planting all sorts of fruit trees and beeches, and mulch newly planted trees with rotten or half rotten dung, also plant out strawberries. The pruning of fruit trees must be completed as early in this month as possible, if it has not been done already, except the fig, which must be deferred till the next month. Grafting of all sorts of apples, pears, plums, and cherries, must be performed this month. Thin out early grapes in the stove and forcing-house, and continue to force seedling strawberries for successive crops to those of last month. If straw has been used for a covering to the fruit, and has become damp, or contracted any unpleasant smell, it must be removed, and sweet dry straw supplied in its room. In the kitchen garden, force cucumbers and melons in frames, kidney beans in the forcing-house or stove, and Elford rhubarb and sea kale under pots. Sow on a moderate hotbed celery and celeriac, radishes, small saladings, and setragonia expansa. Sow in the open borders and quarters asparagus, beet, cabbages, carrots, celery, curled and Hamburg parsley, leeks, lettuce, Neapolitan kale, onions, parsnips, peas and beans, round spinach, salsify, sea kale, scoronera skirrets, &c. Fork over asparagus beds, and make new ones. Plant out the small onions which have been sown thick last spring, for the purpose of procuring large bulbs; also early potatoes, Jerusalem artichokes, chives, garlic, romaine, shallots, rhubarb, and sea kale.

EMIGRATION.

"On Saturday, 15th May," continues Mr Ferguson, "Mr William Dickson having kindly insisted upon conveying and accompanying me to Hamilton, where I was to resume the stage, we started on horseback, after breakfast, and visited various farms upon the township. The road lay along the river, with much fine wood and beautiful scenery. The crops were looking healthy and well coloured. Some farms partly improved and fenced, with houses, were on sale; the price demanded was eight dollars, or 40s. per acre. There seemed to be abundance of water every where, both from springs and brooks falling into the Grand River—a river having no connection with the Utawas, and the substratum was still limestone. Some miles below Galt, there is a valuable gypsum quarry on the banks of the river, and it was curious to observe the line of rich and verdant turf which marked the route of the wagons in their visits to the quarry, from scattering as they went along, strongly evincing the effect as a top-dressing. We called upon a settler from Scotland, newly entered upon a farm of 100 acres, for which he had paid down L.100. The soil was a good rich sandy loam, worth in Britain 35s. per acre at least of rent.

The forest is here thin, probably not having more than forty or fifty old oaks upon an acre, and not requiring these to be destroyed, it being quite possible to guide the plough through the intervals. Walter Smith was busy with his pair of oxen, preparing the land for wheat, of which he expected to have thirty acres sown in autumn, the return from which will probably repay him the price of his farm, and allow him L.50 or L.60 besides for his labour and maintenance, from the first crop alone. There are some delightful situations in this quarter for mansions: the river upon one side, and a lovely sheet of water, called the Blue Lake, upon the other; fine open woods, springs, brooks, and a dry healthy soil. It was a favourite haunt in old times of the Indians, and a little mound close by a copious spring is still celebrated as a place where great councils were held. We stopped to rest our horses at a new village called Paris, belonging to a very active individual of the name of Capron; and having a good water-power and other advantages, it promises to become, ere long, a place of some importance. In the afternoon we reached Brandford, a pretty considerable village belonging to the Indians, a track of land in this quarter having been reserved for their behoof. It is managed by government, who account for rent and sales to the chiefs. There had been a sale of village lots this day, and for the first time I saw the Indians assembled in any number. The lots sold for L.25 one fourth of an acre, which is an immense price in Canada, and argues an expectation of Brandford continuing to prosper. Many of the Indians are now beginning to acquire settled habits, and to cultivate farms, but many more are yet totally abandoned to idleness and debauchery. The country to Hamilton by Ancaster is partly forest, partly settled. The soil is chiefly clay. Ancaster stands high, with some fine farms about it, healthy and well watered. Immediately before reaching Hamilton, we came to the brink of a high limestone ridge, and commanded a magnificent view of the rich flat below, extending to Lake Ontario. At St Catherine's, a small town dependent upon the Welland Canal, we passed that work, and saw some of the wooden locks.

The country through which I travelled next day lies between the great limestone ridge and Lake Ontario. This remarkable ridge extends from the Genesee country, in the state of New York, and, crossing the Niagara river, forms the celebrated falls. It is beautifully diversified with woodland, orchards, and farms, is very productive, and settling with considerable ra-

pidity. On Monday evening I concluded this part of my excursion, by reaching a friend's house at the falls.

This fine province is making wonderful advances, and when the canals and some projected railways are fairly in operation, its progress will become yet more rapid. In 1824, 10,000 bushels of wheat were shipped upon Ontario from Burlington Bay, and in 1830 the export had reached to 150,000 bushels. Five bushels of wheat are allowed to the barrel of flour."—*Agricultural Journal*.—To be continued.

A FEW GRAVE JOKES.

[From "Chambers's Scottish Jests and Anecdotes."]

GRAVEDIGGERS are a peculiar people—differing from the rest of mankind in character and personal appearance. Yet, what is strange, a gravedigger *fit, non nascitur*—the reverse of the poet. The secret of the distinction must consist in this, that it requires to be of a peculiar character, as well as figure, to become a gravedigger. A person may be destined to be, though not born, a gravedigger. He may have in him, from conception, the germs of the qualities of a gravedigger; he comes into the world with them; he hears them about with him during his boyhood, youth, maturity, and middle age; and when he arrives at the full ripeness of *grave-diggerism*, the place falls vacant, and he steps into the dead man's shoes, as naturally as a son succeeds a father to an entailed estate. Though you know that a gravedigger is a mortal like yourself, and may die long before you, it is impossible to help feeling an antipathy to the animal, on the score that he is to handle your precious person with his ignoble hands, when you shall be passive and powerless. One looks upon a gravedigger, especially the gravedigger of one's own parish—supposing you to be a settler—as a sort of executioner. You think you are destined to fall into his hands, and cannot resist the feeling of horror with which one must always contemplate, if not death itself, at least what Bacon calls the adjuncts of death. A gravedigger is not more widely divided from the rest of mankind in character than in interests. Death is death to you, but it is life to him. You are happy in recovering, or in hearing of the recovery of a neighbour, from a desperate illness; but such news is like that of blasted corn, or rising markets, to him. He can have no sympathy with what throws all the rest of the town into anxiety and sorrow—the prevalence of an epidemic disease. The wind of March, which takes away old men's breaths, brings breath and health to him. Cold is warmth to him, and the genial heat of May is the destructive chill of November. As some English divine has emphatically said of the gamester, his business is decidedly unnatural; for he cannot pray for a blessing upon it, without breaking the law which enjoins good will to men. Like Satan, he has said, "Evil, be thou my good!"

Out of curiosity respecting so singular a people, we have collected some anecdotes of various individuals of the species, which may perhaps be found illustrative of their character and manners.

John Prentice, the gravedigger of Carnwath, in Lanarkshire, had a pleasant equivocation, which he constantly used on hearing of the death of any person. "Hech wow!" he would say, "is — dead? I wad rather it had been *ither twa*."

The gravedigger of Sorn, in Ayrshire, was as selfish and mean a wretch as ever handled mattock or carried mortcloth. He was a very querulous and discontented old man, with a voice like the whistle of the wind through a key-hole, on a bleak Sunday afternoon in the country. An acquaintance from a neighbouring parish accosted him one day, and asked how the world was standing with him. "Oh, very puirly, sir, very puirly, indeed!" was the answer; "the yard has dune naething aw' for us this simmer. If ye like to believe me, I havena buriet a leevin' soul this sax weeks!"

John Somerville, the bellman and sexton of Manor, in Peeblesshire, a singularly greedy old man, used to haunt people, who were likely soon to require his services, like a shark following a fever-ship at sea. Whenever he heard of any person throughout that extensive parish having been seized with anything like mortal illness, he would draw towards the house, inquire with great apparent concern for the sufferer, and repeat his visits every day, till the event of either death or recovery. If admitted to see the sick, or informed of the particulars of the disorder, no physician could draw more accurate conclusions as to the result than he. He tracked disease in all his steps, with as much fidelity as the vulture or the carrion-crow follows an army, and with the same purpose. A death was a good thing to him, both in *prospectu* and in *esse*. He lived upon it before as well as after its occurrence. John, it must be understood, was very fond of broth and fat meat, and kept a register in his mind of every person's day for having the pot on in the parish. Now, this predilection of his was prodigiously gratified by these visitations to the houses of the sick; for the people always gave him a share of the food which they might have in preparation, as a sort of part-payment beforehand for his services. He had a trick, independently of these professional visits, of dropping into people's houses about the dinner-hour, and was endowed with what may be called a natural propensity for pot-luck; but though the hospitality of his hosts could not have permitted him, under any circumstances, to fare poorly, it was quite remarkable that when his official

services were likely to be necessary, he was always better treated than at other times.

On a family having removed from the neighbouring parish of Stobo to that of Manor, John was rejoiced to hear that among the new settlers there was one who, in all probability, would soon require his assistance. A single customer procured in this unexpected way was to John as good as other ninety-nine who could not have gone past him. Yet the joy of his mind was not altogether unalloyed. Busy fancy suggested to him the possibility of the family retaining an affection for the burying-ground of their former parish, which might, perhaps, prove the means of depriving him of his victim, after all. To settle the important point, he one day made bold to step up to Caverhill, where the family in question resided. He asked for Mrs S—, of whom he had some previous acquaintance, and was shown into a room. Mrs S. was too unwell to see him, but Miss S., her daughter, came in her place. John introduced himself with a thousand bows and scrapes, and began a long string of well-learned condolences upon the subject of Mr Walter's illness. "How did she think he was? Was there any chance of his *winnin' through*? What hopes did the doctor gie them?" &c. &c. After half an hour of tiresome commonplace, and when the young man's illness had been amply discussed, and considerable hopes of his recovery expressed by his sister, John terminated the conversation with the decisive question, "But, dear me, Miss S., where do you bury? Have ye ground in Stobo, or do you intend to take up wi' Manor?" Miss S. was confounded at the atrocious impudence of the wretch, and permitted him to depart, without gratifying his inquiries.

Robert Fairgrieve, for many years bedral and gravedigger to the parish of Ancrum, in Roxburghshire, was a man of some humour. The minister one day met him coming home sooner than was to be expected from Jedburgh fair, and inquired the reason for such strange conduct, since most of his fellow-parishioners would probably stay till midnight, if not till next morning. "Oh, sir," said Robert, "huz that are *office-bearers* (meaning the minister and himself) should be ensamples to the flock."

When this strange person was on his deathbed, the minister visited him for the purpose of administering some ghostly offices to his soul. He was surprised to find him in a somewhat restless and discontented humour, and not comporting himself exactly as a dying man ought to do. On the clergyman inquiring into the cause of his uneasiness, "Oh, sir," said Robert, "I was just minding that I have buriet five hundred and ninety-eight folk since I was first made bedral o' Ancrum, and I was anxious that, if it were His holy will, I might be spared to make it the sax hundred."

Robert Hannah, who for nearly half a century exercised the trade of gravedigger in the burial-ground attached to the Secession meeting-house at Falkirk, had many of the professional peculiarities of his tribe. For instance, Robin would exert himself in accommodating a good person, or one for whom he entertained sentiments of friendship, and proportionally grudging his labours in behalf of persons comparatively worthless. Somebody one day remarked to him, that the sod upon a particular grave was very fresh and green—"Ay, it's a bonnie turr," he observed, emphatically; "but it's a pity to see it putten down on the tap o' sic a skemp." On another occasion, some one observed him suddenly stop in the newly-begun work of forming a grave, and take his way towards the place where his implements were deposited, from which he selected one, and then returned, with a face lighted by a peculiar expression. On being questioned as to his motive for this proceeding, he answered, "Od, he was sic a fine chiel (meaning the individual for whom he was digging the grave), that I just thought I would howk his grave wi' the new spade."

CONFINING JURORS FROM MEAT AND DRINK.

The Gothic nations were famous of old for the quantities of food and drink which they consumed. The ancient Germans, and their Saxon descendants in England, were remarkable for their hearty meals. Gluttony and drunkenness were so very common, that those vices were not thought disgraceful; and Tacitus represents the former as capable of being as easily overcome by strong drink as by arms. Intemperance was so general and habitual, that no one was thought to be fit for serious business after dinner; and, under this persuasion, it was enacted in the laws, that judges should hear and determine causes fasting, and not after dinner. An Italian author, in his antiquities, plainly affirms that this regulation was framed for the purpose of avoiding the unsound decrees consequent upon intoxication; and Dr Gilbert Stuart very pertinently and ingeniously affirms, in his Historical Dissertation concerning the Antiquity of the British Constitution, p. 238, that, from this propensity of the older Britons to indulge excessively in eating and drinking, has proceeded the restriction upon jurors and jurymen to refrain from meat and drink, and to be even held in custody, until they had agreed upon their verdict.

BIBLE SOCIETIES.

It is a singular fact, that the first Bible Society that ever existed was established by some Roman Catholic prelates in France in 1774.

Column for the Bops.

MY DEAR LITTLE BOYS.—Among other nice things which I promised in my Address to tell you of in the Journal, was the proper plan on which to keep and feed rabbits, should you find convenience for doing so; and I now proceed to give you the result of my own juvenile experience, as well as of different writers on this interesting subject.

In entering upon my explanations, I would beg to offer you two friendly admonitions. In the first place, you must contrive to make this and similar avocations secondary to your ordinary duties or studies; and, in the second place, you ought on no account to forget to feed and regularly attend the animals you keep for your amusement. Poor creatures! they are confined and wholly dependent on you; and it would be the extreme of barbarity to neglect them. If we keep any living creatures in a confined state, we enjoin a duty on ourselves of providing for their wants. Depend upon it, that the boy will rue the day, unless he have decidedly a bad heart, who sits down to a comfortable meal, while his rabbit or his bird—heretofore his idol and his toy, but now, in caprice, neglected—pines in its prison for his appearance with its usual daily food. If he be tired of that, which, when it was a novelty, he took so much delight in, he had better sell, give away, or even humanely kill it, than suffer it to languish its solitary hours in hunger and in thirst. It has a claim on his care, which should be irresistible—it is helpless and imprisoned—is he not cruel in the extreme, if he omit to furnish it with its daily pittance?

Of rabbits there are divers kinds, but it is only the tame common Scottish rabbit that I need here treat of. Wild rabbits will breed eleven times in the year, and bring forth generally eight young ones each time: at this rate, in four years, a couple of rabbits would produce a progeny of almost a million and a half.

Notwithstanding the fecundity of the animal in its wild state, it is much more profitable when domesticated; for although a prudent fancier will not suffer his doe to have young more than five or six times in a year, the produce of the tame animal, on account of the care taken of them, will be greater at the end of the year than that of a wild one, notwithstanding the latter should have double the number of litters; multitudes of the wild rabbits when young, being destroyed by damp, the old bucks, and the numerous four-footed animals which prey on these almost defenceless creatures. The value of live rabbits varies, or is quite uncertain; and they may be bought from twopence to one shilling the pair. One of the chief objects in keeping common rabbits, is that of occasionally furnishing a dish for the table: and, therefore, those persons by whom they are kept, attend as particularly to the sort of rabbits whose flesh is said to be the best, as to their colours or shape.

The short-legged stout rabbits are generally supposed to be the most healthy, and also the best breeders. The large hare-coloured variety is much esteemed by some people; but the white, or white mottled with black or yellow, are more delicate in flesh. The grey and some of the blacks approach nearer to the flavour of the wild rabbit than any others. With respect to the colours of these animals, grey is considered the worst of all colours; black is the next in gradation; fawn and white and gray hold the third place in estimation; pure white, with red eyes, is by some reckoned equal with, and, by others, superior to these; tortoise-shell (a rich brown and white, and brown, grey, and white) and black and white, rank the highest; mouse-colour, though little noticed by fanciers in general, is much admired by a few.

The most important part of the duty of the young rabbit fancier is to erect his rabbit house or hutch on proper principles. Two objects are particularly necessary to be attended to. The house or rabbitry must be kept always dry and well aired; because the rabbit in its natural state prefers a dry and airy habitation. Some boys keep rabbits in hutches made of old tea-chests, and this is very well to begin with; but whether kept in these boxes, or in regularly erected houses, the place must be kept quite dry, as too much humidity will cause the rabbits to rot. Where considerable numbers are kept, fresh air is of great moment; still they should not be exposed to draughts, which may bring on a disease called the snuffles—a dangerous and frequently fatal malady.

Boys who live in large towns, such as Edinburgh, will in general find considerable difficulty in keeping rabbits, as it is seldom they have open grounds behind their houses wherein they might construct their rabbitry. In cases of this nature, rabbits might be kept on a small scale, in wooden hutches, made out of old egg or tea-chests, open in front with spokes like a cage, and having a division to separate the sleeping apartment from the feeding-place, and a small door betwixt the one place and the other. But it will be found, on trial, that rabbits do not do well when put in cages, or confined in this manner. The genuine rabbitry must be a small house constructed on purpose, where the animals will have liberty to feed and amuse themselves. These houses may be built about four feet square, and the same in height, with a sloping roof, covered with thatch, or some other substance that will carry off the rain. This house ought to be paved on the floor, so as to prevent the rabbits from burrowing, and undermining the walls. It should be well laid with nice dry straw or meadow hay, and possess several boxes with the open side downwards,

and holes for the rabbits to go in and out. It would also be as well for these holes to be provided with doors, which you could shut when necessary. To this house there ought to be attached a little open court, also paved, and covered completely with open spokes, so as to give air and light, as well as to afford you an opportunity of seeing the creatures feeding.

William Cobbett, in his valuable little manual called "Cottage Economy," recommends the keeping of rabbits by boys and others. "Three does and a buck," says he, "will give you a rabbit to eat for every three days in the year, which is a much larger quantity of food than any man will get by spending half his time in the pursuit of wild animals. The produce has not long to be waited for; in short, they keep an interest constantly alive in a little chap's mind; and they really cost nothing. The care is all; and the habit of taking care of things is of itself a most valuable possession."

On the subject of feeding rabbits, I cannot do better than offer the following extract from "The Boys' Own Book":—

"If too much food be given at once, the animals will get disgusted with and refuse it, so that a rabbit may be nearly starved by affording it too great a quantity of food. Most persons feed their rabbits twice; but for our own part we feed ours thrice a day. To a full grown doe, without a litter, in the morning, we give a little hay or dry clover, and a few of such vegetables as are in season; in the afternoon, we put two handfuls of good corn into her trough; and at night we give her a boiled potato or two, more vegetables, and, if her hutch be clear of what we gave her in the morning, but by no means otherwise, a little more hay or clover. If you give rabbits more hay than they can eat in a few hours, except it be to a doe just about to litter, they will tread it under foot, and waste it; if you give them but a moderate quantity at a time, they will eat and enjoy it. Generally speaking, rabbits prefer green or moist food to corn; but it is necessary to make them eat a sufficient proportion of solid food, to keep them in health; occasionally, instead of corn, we give our rabbits a few split or whole grey peas. When a doe has a litter by her side, and also for rabbits recently weaned, we soak the peas a few hours previously to putting them in the trough. If a rabbit will not eat a proper quantity of corn, we mix a small quantity of squeezed tea-leaves with her portion, and stint her proportionately in green meat. Tea-leaves, in small quantities, well squeezed, may at all times be given, by way of a treat; but it is highly improper to make them a daily substitute for green meat."

Almost all the vegetables and roots used for the table may be given to rabbits; in preference to all others, we choose celery, parsley, and the roots and tops of carrots; and in this choice the animals themselves heartily agree with us; lettuces, the leaves, and, what are much better, the stumps of cabbages and cauliflowers, they eat with avidity, but they must be given to them with a sparing hand; turnips, parsnips, and even potatoes in a raw state, we occasionally afford our stock, on an emergency, when better roots or good greens are scarce. In the spring time, no soft meat is better for them than tares, so that they be not wet; in fact, no green meat ought to be given to rabbits when there is much moisture on its surface. We have heard of some country persons feeding their rabbits on marshmallows, but we never did so ourselves. Dandelions, milk-thistles, or sow-thistles, we know, by long experience, they take in preference to all other food, except celery, parsley, and carrots; and nothing, we are convinced, as green meat, can be better for them.

It must be remembered that a doe will eat nearly twice as much when suckling as at other times; and when her litter begin to eat, the allowance of food must be gradually increased. In our own rabbitry, we never admit chaff, and grains only in a dearth of green food. If we can obtain neither greens, roots, nor grains, at feeding time, we make it a practice to moisten the corn with water, milk, or, as we before stated, with tea-leaves. Though a rabbit must be restricted from rioting in green or soft meat according to its own appetite, for its own sake, yet it is cruel to afford it only such food as will increase rather than appease its thirst; for this reason, in such a case as we have mentioned, we moisten the grain; and some rabbits will even do well with an occasional tablespoonful of water, beer, or milk; but it is a dangerous experiment to try the effect of a liquid on their stomachs.

If well fed, and kept warm, does will breed all the year; but most fanciers are contented with five litters a year, and let them rest during the winter. It is a disadvantage, rather than otherwise, to have above six produced in a litter, as the young rabbits, when that is the case, are almost invariably weak and puny; and even if they be reduced to a moderate quantity, by removing some of them to another doe, or otherwise, they rarely become remarkable for their size or beauty.

Diseases may in a great measure be prevented by regularity in feeding, good food, and cleanliness. The refuse of vegetables should always be scrupulously rejected. For the liver complaint, to which rabbits are subject, there is no cure; when they are attacked by it, fatten them, if possible, for the table. The snuffles are occasioned by damp or cold. If there be any cure for this disorder, it must be dryness in their hutches

and food. Squeezed tea-leaves generally restore a doe to health, if weak, or otherwise affected after kindling, if the food which we have directed to be given at that time, under the head of breeding, should fail. When old rabbits are attacked by a looseness, dry food will in general restore them; but do what you will, it is very difficult, and in most cases impossible, to save young ones from sinking under it; dry food for them, as well as for the old ones, is the only remedy.

Be careful (continues this author) to keep your rabbit hutches particularly clean; a short hoe, or a trowel, and a hand-brush, will be necessary for this purpose. Do not handle your rabbits, particularly the young ones, too much; when you lift them, take them with one hand by the ears, and place the other under the lower part of their backs."

THE THAMES.

This river, so famed in the commercial world, derives its name from a compound of Thame and Isis, and which, in process of time, came under the familiar denomination of Thames. The junction was formed a little above Oxford; but the Isis now is lost in the compound term, as the river is denominated the Thames, even to its very source. The banks of the Thames have long been famed for their beauty of verdure, and the taste with which they are adorned. They are studded with neat cottages, or elegant villas crown the gentle heights; the lawns come sweeping down like carpets of green velvet to the edge of its soft-flowing waters; and the grace of the scenery improves, until we are borne into the full bosom of its beauty, the village of Richmond, or, as it was anciently called, Sheen. Below London Bridge we have Greenwich, and other beautiful scenery of the county of Kent. The opposite bank on the Essex side is flat, and is famed for nothing but Tilbury Fort, where Elizabeth, when the Spanish Armada threatened this country, reviewed her troops, who were collected to repel the invaders.

THE TOWN OF DELFT.

"In the ride from Rotterdam to the Hague," says Elliot in his *Letters from the North of Europe*, "a distance of twenty-seven miles, we passed through Delft, which is situated half-way between the two. It is a gloomy little town, containing fifteen thousand inhabitants, about one-fourth of the population of Rotterdam. The learned Grotius was born here. A simple monument is erected over his body, which lies in one of the churches. The sculpture represents his head, and by the side of it a child leaning on an urn with an inverted torch. The emblem is perhaps more significant than was intended, adverting not only to the extinction of life, but also the perversion of talent. The same building contains a monument to the memory of William I., Prince of Orange, who was assassinated here in 1584. As a specimen of sculpture, it is perfect. At the feet of the prince, recumbent on a marble sarcophagus, the favourite dog is sleeping, who roused him from slumber when some Spanish murderers entered his tent in the campaign of 1572. After the death of his master, the faithful animal refused nourishment, and died of a broken heart."

LAND-TAX IN ENGLAND.

The first land-tax was in the reign of Ethelred II., with whom the Danes had broken an agreement. The invaders committed horrid cruelties and devastations all over the kingdom, and the timid Ethelred paid them no less than £24,000 for peace. This was levied on land, and was called *dane-gelt*, by which ignominious name the tax, called land-tax, was first known in England. The modern land-tax was first established at the Revolution in 1688, from which period, to the year 1800, it yielded above £227,000,000.

PERFECTIBILITY.

To bring the minds of men to the same level, to bestow upon them all an equal delicacy of perception, or the same accuracy of judgment, would be as chimerical as the wild projects of universal monarchy, or universal fraternity. The storm of passion cannot be allayed by any magic of words; the bitterness of opposing parties cannot be sweetened by any dictates of philosophy. While power is gratifying, while wealth procures enjoyment, while men are ambitious, nations will seek supremacy, and armies will contend. No hope of endless perfectibility, then, is here indulged; neither is it denied that events will continue in future ages, as in times past, to revolve within a certain, though a widening orbit, where empires will shine for a period, to set in glory or in shame.—*Che-nevi's Essay on National Character*.

INTOXICATING ELEPHANTS.

The Indian-Mahomedans take great pleasure in making elephants drunk, "by certain drugs mixed up with the wax from the human ear," and setting them to fight. Tigers and elephants also enter upon the arena in mortal combat, and tigers and buffaloes, or alligators; or in the absence of such lofty excitement, it is deemed an amusing pastime to throw in a tame antelope or stag, and see it torn to pieces by a leopard. Tigers and leopards are frequently tamed and brought into the room after breakfast, as an English gentleman would exhibit a favourite spaniel.—*Athenæum*.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM CHAMBERS, AUTHOR OF "THE BOOK OF SCOTLAND," "GAZETTEER OF SCOTLAND," &c.

No. 7.

SATURDAY, MARCH 17, 1832.

PRICE THREE HALFPENCE.

REMOVALS.

"Three removes are as bad as a fire."
"A rolling stone gathers no fog."

Poor Richard.

THERE is an allegory in the Spectator, called, if I recollect rightly, "The Mountain of Miseries." It narrates how the human race were once summoned by a good Genius to a particular spot, and each permitted to cast down the misery which most afflicted him, taking up some one which had belonged to a fellow-creature, and which he thought he should be more able to endure. Some cast down diseased limbs, some bad wives, and so forth; but the end of the story is, that after the exchange had been made, all felt themselves a great deal more uneasy under their adopted evils than they had ever felt under their natural ones, and, accordingly, had to petition the Genius for permission to take back each his own proper original misery. I have often thought that the practice of removing from one house to another, in the hope of finding better ease and accommodation, was not much unlike this grand general interchange of personal distresses; and often on a Whitsunday in Scotland, when I have seen people flying in all directions with old tables and beds, that would have looked a great deal better in their native homes than on the street, I have mentally compared the scene to that which is so graphically described by Addison.

The English, it seems, are not much of a removing people. When a Southron once settles himself down in a house, he only quits it with the greatest reluctance. No matter for an increasing family—no matter for bettered circumstances—no matter for the ambition of wife or daughters to get into a genteeler neighbourhood. An Englishman has naturally a strong feeling about his house: it is his castle, and he never will abandon the fort so long as he can possibly retain it. Give him but a few years' associations to hallow the dwelling—let him have been married in it, and there spent the years of the youth of his children; and sooner than part from the dear little parlour where he has enjoyed so many delightful evening scenes, with his young spouse and his happy infants around him, he would almost part with life itself. An Englishman gets accommodated to all the inconveniences of his house, however great, as naturally as the fish with its shell, however tortuous. Some strange angularity in his vestibule, which nearly throws you down every time you visit him, may appear to you a most disagreeable crook in his lot, and one that ought to make the house intolerable to him; but, ten to one, he looks upon it as only an amiable eccentricity in the plan of the mansion, and, so far from taking ill with it, would feel like a fish out of water if it were otherwise.

The Scotch, on the contrary, are an eminently migratory people. They never are three months in any house till they wish that the annual term were once more at hand, when they might remove to another. There is no day in the year so important in their eyes as Whitsunday, when almost the whole population of every considerable town is found to be on the move, exchanging houses with each other. This is a curious feature in the people, and seems as if it only could be accounted for by supposing that the nation is totally deficient in the phrenological organ called *inhabitativeness*. It is all to no use that experience is constantly showing how vain are their expectations of better lodging.

Every disappointment seems to give them but a keener relish for a new attempt.

The fact is this: A family always enters upon a new house in a state of high hope as to its accommodations. So long as the recollection of their deserted abode is still fresh, the new house appears a paradise; for, mark, it has been selected on the express account of its not being characterised by any one of the inconveniences alleged against the old. By and bye, however, its own peculiar evils are felt; and, long before Candlemas day, it has been found as disagreeable as the other. Then a new one is selected, which in its turn is declared as bad as any. So far as my observation has extended, the itch for removing more generally prevails among the female than the male department of the population. Husbands, in general, are too little in the house ever to fall out of conceit with it; but the wife, as the more domestic creature, has full opportunity to observe and feel its defects; and she it is who most frequently urges and achieves the removal. There are various things about a house in which the husband can never see any importance, or feel any interest, but which appear to the wife as each the most cardinal of all cardinal points. One of these, for instance, is a back-green. "A back-green!" let the words be pronounced with solemnity befitting their awful import. Often, when a house has seemed to the husband all that could be desired, he has been thrust out of it, whether he would or not, all on account of a thing which was as inexplicable to him as the mysteries of the Chinese faith—a back-green! Perhaps you hear some day that your back-green lies totally out of the sun, or that the right use to it is shared by some disagreeable neighbours, or is naught for some other equally intelligible reason. But you learn no more, and next Whitsunday you find yourself in the horrors and agonies of a removal to some distant part of the town, all on account of a little space of ground, of which you never yet could guess the use or purpose. Very often you are removed from a comfortable and every way excellent house, because it wants a back-green, and taken to one every way inferior, and, indeed, utterly wretched, but which, in the eyes of your sweet spouse, is rendered equal to a palace—because it has a back-green. I would advise all husbands to keep a sharp look-out after the back-greens, as well as several other things, which I shall point out to them.

Let us suppose a case of proposed removal in the middle walks of life. You are, say, the father of a rather numerous family, living very contentedly in a flat in not the least dense part of the town. For a long time there have been grumblings like distant thunder among the mountains; but you have never yet heard any very strong reason urged why you should remove. At length, about the New Year, these mutterings begin to get voice; and your wife, some quiet evening, after all the young people are gone to bed, opens a sudden and most tremendous attack upon you, respecting the necessity of no longer keeping the children pent up in this small dwelling, so far from any play-ground or fresh air. And, really, she does not think it is good for her own health that you should live any longer here. She has plenty of exercise, she acknowledges, but no air. It is so far from public walks, that it makes a toil of a pleasure before they can be reached. And then, no place whatsoever to dry

the clothes. Your own shirts are never properly seen to, being only hung in an open garret, where they are exposed to all the smoke of the town; at least, all that chooses to come in at the skylights. And there is no such thing as a servant's bedroom in this house. The girl, I assure you, has her own complaints as to the hardship of being obliged to sleep in that den above the kitchen door. And as for the stair, is it not a thoroughfare to all the scum of the town? Some of the neighbours, I assure you, are no better than they should be, if all tales be true. There is even an old man in the garret who is supposed to live by *Burking*. The fact is, we would now require an additional bedroom for the boys, &c. &c.

Lectured up to removing point, you consent, unhappy man! to leave your shop some forenoon, in order to take a walk with your wife about the outskirts of the town, in search of a more airy, more spacious, and more genteel abode. You are dragged "by the lug and the horn," as shepherds say, through multitudes of those "delightful small self-contained houses," which offer, "within twenty minutes' walk of the College," all the elegancies of Heriot Row and Great King Street at a tithe of the rent. You find them all as like each other in the interior as if they had been made on the principle of chip-boxes; but yet, to your wife, each seems to have its own peculiar merits. One excels in the matter of a lobby; another has an extra closet; a third affords a superior view from the drawing-room windows; and a fourth—O merit above all merits!—transcends its fellows in the article of a back-green. Every thing, however, is inspected—every thing is taken into the general account; and the result of the whole is, that though the rent is ten pounds higher, and the dining-room a thought less than in your present abode, you *must* remove. The carpets, with a very little eeking and clipping, will all suit. Your sideboard, of which your spouse has a measure in her reticule, will exactly answer the recess devoted to it. The jack in the kitchen answers to a tee; and even the scraper at the door has something about it that is singularly appropriate, as if the builder at the very first had designed to "take the measure of your foot." All things appear, in the showing of your good dame, to be so remarkably answerable and proper, that you half believe it to be a matter of destiny, and, in completing your arrangements, hardly bargain so much with the landlord as with Fate.

During the spring months which elapse before the day of removal, you live in a state of dreamy bliss respecting your new house. Almost every fine morning you rise about seven for a walk, and by a strange chance you invariably take the house of promise in your way, and enjoy a survey of its external excellencies. When you observe, from the closed shutters, that its present occupants, so far from being agog about it like yourself, are snugly snoozing in their beds, you wonder at their indifference. If you were they, you would have been up hours ago, enjoying the air in the back-green, or playing the King of the Vandals in the front-plot. What a pity to see that splendid ruin of a rhododendron drooping in that fashion! What a shame to pay so little attention to the boxwood! At length, the 25th of May arrives. You transfer yourself to the now vacated tenement, pitying with all your heart the stupid people who have left it.

For a time, a kind of honeymoon delirium pervades the household. You certainly do find some pleasure in contemplating from your drawing-room windows the cattle in the neighbouring grass-park, even though sensible all the time that they are only kept there *in petto* by the extorting butcher at the end of "the Row." Your wife, too, reposes upon the joys of her back-green with a gratulation of spirit that seems as if it could never know an end. And while the servant girl rejoices in a chamber to herself, your boys have sport unceasing in pasting over the kitchen door with pictures and excellent new songs. But all this only holds good while summer lasts—summer, during which no house ever appears inconvenient or disadvantageous. By and bye comes the winter of your discontent. The views from the window are no longer fair; the back-green, which already in autumn had begun to lose its character as a play-ground, in consequence of the swarms of creeping things which covered the walls in such a way as if they had a design to form a living entomological museum, and so fairly frightened the children into the house, is now a sink of mud and melting snow; the serving-wench finds that it was better to sleep in "that den above the kitchen door"—in so far as the said den was very "cosey"—than to lie in a chamber under the slates, exposed to the malevolence of the elements in all its shapes. You find, too, that in the short days it is not very agreeable to walk several times to and from town in the dark, through a district which, in the language of house-proprietors, "has the advantage of being out of the bounds of police." The phrase "within twenty minutes' walk of the College" appears to you as only calculated for the faculties of some itinerant prodigy, in as much as it never takes you less than twice the time. The worthy housewife herself, after long suffering in secret, and great reluctance to confess her counsel wrong, has to complain at last of "the distance from the market," which obliges her to buy every thing from small dealers in the neighbourhood, who necessarily must make up for uncertain custom by "two prices." No getting so much as a pennyworth of vegetables without sending for it nearly a mile; and then "that creature Jenny," there is no sending her out, you know, even upon the shortest errand, but she stays an hour. When we want even so much as change for a shilling, there is no getting it nearer than Port Hopetoun, which is half a mile away. Then we are such a distance from the kirk. It is only in fine weather we are able to get that length, and at most only once in the day. I declare, if we stay here much longer, we shall become absolute heathens. Although, to be sure, we pay less taxes in this out-of-the-way place than we did before, have we not lost a washing-tub, from there being no police? And then, is there not a toll-bar betwixt us and the town, at which we must pay one shilling every time we have to go out or come home in a coach? And, above all things, we are cut off here from all our friends and acquaintances. We do not know a soul nearer hand than the Duncans, who live at the back of the Meadows. And there is no dropping in here, in an easy way, upon a forenoon call, but the people, when they reach us, are so much fatigued with the distance, that they must be asked to stay to dinner: and the case ends, perhaps, with the good man being obliged to walk three miles home with a young lady at twelve o'clock at night! Only think of that! No, no; this cold, outlandish, genteel place will never do. Give me a good front door in the New Town, "with all the conveniences," and I'll leave such places as this to them that like them better.

When once a resolution is formed to leave a house, it is amazing how many holes are picked in its character, many of them literal. The wind gets in at a hundred places; we can see daylight through stone walls and double-deafened ceilings. Then there is such a draught up the staircase, and into the best bedroom, that positively there is no enduring it. I think another six months of this house would fairly make an end of me. It's not a house for tender folk. You might sometimes as well sit in the open street as by the fireside. You burn your shins, and all the time your back is freezing. Upon my word, I think we should save all the difference between this and a front door in doctors' bills!!

A front door is then determined upon; and you think you have at length, by a little stretch of your purse, reached the very perfection of comfort. But, alas! "*fronti nulla fides*," which is as much as to say there is no reliance to be placed on a front door. It is true, you escape all the evils of your former habitation, and that nothing can match your back kitchen as a convenience to the servants. But then the family living above you has twice your number of children; and these imps seem to do nothing whatever the whole day long, from six in the morning till seven at night, but run pat, pat, pat, along the floors overhead, till they almost drive you mad, *non vi sed sæpe cadendo*. Even the charms of a back-green, or a superior scullery, will not stand against this; and so you determine at last to go to an upper flat in the same neighbourhood, where you may have the pleasure of tormenting some person below with *your* children, without the risk of being at the same time tormented yourself. The last selection is made upon moderate and prudent principles; but yet hope is also even here upon the wing. The house has no pretensions to style or external grandeur, but yet "Edwin was no vulgar boy." The stair is remarkably spacious and well lighted, and has, further, the

advantage of a door at the bottom, which can be opened by any inhabitant, by means of a pulley, without the necessity of descending to the bottom. In fact, it is what I would call a genteel stair. "The Stevensons" live in the first flat. The kitchen door has a nice hole at the lower corner for the cat; and what a delightful place there is by the side of the fire for the lamp, or where we could keep our salt dry in a pig! The request of the Regent Earl of Mar, as inscribed on the front of his house at Stirling,

"I pray all lukaris on this judging
With gentil ee to gif their judging,"

comes powerfully into force in all cases where the tenant is just entering upon his house. As in the other case every fault is exaggerated, and made the subject of congratulatory disgust, so in this, every fault is extenuated. "The ceilings are a little contracted, I see, by the roof." "Oh! a wee thought coomecyed—a very small matter; these rooms are only intended for the children. We have some capital public rooms at the back, looking into the Queen Street gardens, and have a little peep of the sea in the distance." "Upper flats," observes your Malagrowther friend, "are very apt to smoke." "Oh! not at all, I assure you. But I have been assured that Dr Bonnyman cured this house entirely some years ago, and since then there has never been a single puff of smoke." "Your nursery is in the garret; don't you think the children will feel it rather cold?" "Oh, the most comfortable nursery in the world; and see, *only see*, what a nice door there is at the top of the garret stair to prevent the bairns from tumbling down!" "I am sorry, however, to see a green-wife established so close beneath the door, at the bottom of your common stair." "Oh, sir, but consider the convenience of the greens." In fact, there is no peculiarity about the house, however trifling, but, in the eyes of a new tenant, it will seem a beauty, as in those of a departing one it will constitute a disgrace. And this is just the philosophy of the question, and the real cause why there is so much useless tossing and tumbling of old furniture on each 25th of May.

LOCKE'S CONFESSION OF BELIEF.

I HAVE long been of opinion that the foundation of many of the errors into which mankind daily fall, lies in the indefinite unexamined notions which they possess upon almost any given subject. Words, and not ideas, being only what are taught at our scholastic institutions, and the juvenile mind being seldom, except by chance, subjected to cultivation, we find that people, when they arrive at manhood, have in most instances no settled defined opinion on the character and what will be the results of particular lines of conduct, and that the judgment is left entirely to be formed from the lagging experience of years. It has been suggested to me that much of this mischievous want of sober reflection might be obviated by every person, who is capable of reasoning, reducing their opinions (in morals, religion, and politics, for instance) to a formal confession of belief—that is, write down what they actually think on such subjects. Yet it is perhaps vain to expect that persons who are engaged in the multifarious duties of life should thus turn author, as it were, though but for an hour; and, in such a case, the next best is for them to ponder on the confessions of opinion of some of our greatest luminaries in philosophic reasoning.

If I were asked to point out to the juvenile inquirer after truth where he ought to pursue his search, I would say, read, learn, and act upon the philosophy of John Locke. His Essay on the Human Understanding, I need not say, is invaluable; but his loose papers, recently brought to light by Lord King, and appended to the life which he has written of that distinguished man, are also excellent. The latter work, being published in an expensive form, very few can have it in their power to examine it; and I therefore take the liberty of extracting some of the more practically useful articles; in the meanwhile offering the following confessions of belief, which Locke entitles

THUS I THINK.

It is a man's proper business to seek happiness and avoid misery.

Happiness consists in what delights and contents the mind, misery in what disturbs, discomposes, or torments it.

I will therefore make it my business to seek satisfaction and delight, and avoid uneasiness and disquiet; to have as much of the one and as little of the other as may be.

But here I must have a care I mistake not; for if I prefer a short pleasure to a lasting one, it is plain I cross my own happiness.

Let me then see wherein consists the most lasting pleasures of this life, and that, as far as I can observe, is in these things:—

1st, Health—without which no sensual pleasure can have any relish.

2d, Reputation—for that I find every body is pleased with, and the want of it is a constant torment.

3d, Knowledge—for the little knowledge I have, I find I would not sell at any rate, nor part with for any other pleasure.

4th, Doing good—for I find the well-cooked meat I ate to-day does now no more delight me; nay, I am diseased after a full meal. The perfumes I smelt yesterday now no more affect me with any pleasure, but the good turn I did yesterday, a year, seven years since,

continues still to please and delight me as often as I reflect on it.

5th, The expectation of eternal and incomprehensible happiness in another world is that also which carries a constant pleasure with it.

If, then, I will faithfully pursue that happiness I propose to myself, whatever pleasure offers itself to me, I must carefully look that it cross not any of those five great and constant pleasures above mentioned. For example, the fruit I see tempts me with the taste of it that I love, but if it endanger my health; I part with a constant and lasting for a very short and transient pleasure, and so foolishly make myself unhappy, and am not true to my own interest.

Hunting, plays, and other innocent diversions, delight me: if I make use of them to refresh myself after study and business, they preserve my health, restore the vigour of my mind, and increase my pleasure; but if I spend all, or the greatest part of my time in them, they hinder my improvement in knowledge and useful arts, they blast my credit, and give me up to the uneasy state of shame, ignorance, and contempt, in which I cannot but be very unhappy. Drinking, gaming, and vicious delights, will do me this mischief, not only by wasting my time, but by a positive efficacy endanger my health, impair my parts, imprint ill habits, lessen my esteem, and leave a constant lasting torment on my conscience; therefore all vicious and unlawful pleasures I will always avoid, because such a mastery of my passions will afford me a constant pleasure greater than any such enjoyments, and also deliver me from the certain evil of several kinds, that by indulging myself in a present temptation, I shall certainly afterwards suffer.

All innocent diversions and delights, as far as they will contribute to my health, and consist with my improvement, condition, and my other more solid pleasures of knowledge and reputation, I will enjoy, but no farther; and this I will carefully watch and examine, that I may not be deceived by the flattery of a present pleasure to lose a greater.

THE KLINKENBERGS.—A TALE.

BY THEODORE HOOK.

SOME years before this history begins and ends—for it is as brief as the life of a butterfly—the old King of Bavaria, having taken a particular dislike to his palace of Starenberg, gave the veteran General Klinkenberg permission to inhabit a certain portion of the building. To this quiet retreat the general and his two daughters, Amelia and Caroline, forthwith repaired, and there they resided until the period at which I have the honour of introducing them to the reader.

Nothing could be more agreeable to the ancient warrior, after his active services, than this domicile; and as for the young ladies, they were absolutely charmed with it, from its beauties, and its proximity to Munich.

In this Bavarian Hampton Court, time passed delightfully; the mornings were spent much as mornings are when handsome accomplished women and agreeable well-educated men associate much together; and although Captain Steinfeld and Lieutenant Melfort had not yet ventured to hint at any "*ulterior objects*," the friendship which actually existed between the four happy ones, seemed to require only a declaration on the part of the beaux, to convert it into a sentiment somewhat more tender, and infinitely more delightful—and so things went on.

In the midst of this agreeable intercourse, varied by the visits of the general's friends from Munich, and his neighbours at Starenberg, an event occurred which agitated the whole country, and changed the face of "affairs in general"—the King of Bavaria died!

On every side were grief and desolation—the shops of Munich were closed—the great bells tolled heavily—the flags hung half-staff high—the sorrowing creatures of the monarch's bounty bowed their heads and wept—minute-guns from the batteries boomed upon the ear, and muffled drums announced the ceremony with which, in all the solemn pomp of woe, the mortal remains of the good king were deposited in the stately tomb of his ancestors. And then all was smiles and congratulations—"tipsy dance and revelry"—the shops in Munich were opened, the cannon fired salvoes from the batteries—the bells rang merrily—the flags were hoisted to the very trucks; and the sorrowing creatures of the old king's bounty dried their tears and doffed their sables, and, dressing their faces in smiles, hurried to the palace to beslime its new occupant with their venal adulation.

"What a king we have got now!" cried one, who never would have been a judge of kings if the late monarch had not made him what he was. "What wisdom!" says a second. "What goodness!" cries a third. "What taste!" exclaims a fourth. "How affable!" a fifth. "How unlike the old king!" a sixth. And thus, not content with taking the good "the gods provided," they sought to ingratiate themselves with their new master by instituting comparisons between him and the old one; which, to say nothing of the taste of the system as likely to please his majesty, savoured not a little of that which is sometimes found even in Munich—ingratitude.

The new king, in the bloom of youth, handsome, graceful, gay, and accomplished, mounted his milk-white charger, and, attended by all his court, envied and flattered through the streets—what condescension!—flags and banners were waved on the

parapets, and flowers were scattered from the windows. The next day he perambulated the town, accompanied only by his brown umbrella—what affability! His majesty held levees; the palace was thrown open, and the receptions were innumerable; for his late father had been some time before his death infirm and ill, and had therefore lived principally at Nymphenburg, his favourite residence, which he had splendidly decorated and tastefully improved. To Nymphenburg the new king took a decided aversion; it was closed immediately on his accession, and Count Slaphausen, who had regulated all his father's affairs there, was dismissed. Stiffincroup was named prime minister, and Snyderkins, who had never slept from under the palace roof for twenty years, was sent ambassador to the court of Ashantee.

All that the king did, the people approved. He remodelled the Bavarian code of laws—he corrected abuses in the state—he changed the colour of the pages' pantaloons from pea-green and silver to white and gold—he reversed all his father's decrees—he altered the uniform of the foot soldiers—he granted universal liberty of conscience, and gave a ball once in every week; and, strange to say, great as were the deeds of this illustrious monarch, no act of his royal life is so nearly connected with the subject-matter of this little story as the last-named manifestation of his royal grace and bounty.

To one of those balls were invited General Klinkenberg and his two charming daughters, an event marked with consequences which none of the parties most deeply concerned in the slightest degree anticipated, but which, if we have but a little patience, we shall see eventually proved of the highest importance.

General Klinkenberg was no courtier, and at sixty-five no dancer; but the invitation was a command; and even if he had hesitated as to its acceptance, the young ladies would have overruled all objections, and overcome all obstacles. Amelia, the elder of the two, was celebrated in her circle for her dancing; her eyes were as bright as diamonds, and her hair, which curled profusely over a snowy forehead, was as black as jet—her figure was symmetrical—her grace proverbial. Caroline, the younger sister, was fair, and her soft blue eyes and gentle demeanour often won hearts which would hold out fearlessly against the bolder attacks of her sprightly sparkling sister.

In the ballroom Amelia attracted all attention, and seemed to revel in the sunshine of the gaze she excited. Caroline shunned, or seemed to shun, the looks which were sometimes rivetted on her mild and gentle countenance—but people live not always in ball-rooms, nor establish their characters in crowded assemblies, and Caroline, in her own home, mild, amiable, and affectionate as she was, drew around her the tenderer and deeper feelings of the heart. Caroline had formed the first, the ruling attachment of her life—Melfort had won her! had gained her esteem, her regard, her love; and these sentiments were founded upon a near and constant observation of his mind and manners, character and disposition. She had no disguise in avowing the feeling he had inspired; she spoke of him, felt for him, thought of him as a brother; it was only when he was absent that she could at all appreciate the value she set upon his society; and when the royal command to the ball arrived, it pained her to the very heart—that going without him was inevitable.

Steinfeldt was not invited; but Amelia, although she would have been better pleased if he had been of the party, felt no regret like Caroline's which could for a moment counterbalance the pleasure she anticipated at court—a sphere well suited in her ardent mind for a girl of her birth, appearance, and accomplishments; and she rallied her more sensitive sister upon the regret she expressed, and the sorrow she too evidently felt, at Melfort's absence.

From the moment their going was decided upon, the activity of preparation evinced by Amelia, strongly contrasted as it was by the placid sufferance of Caroline, under the suggestions of the leading *marchand des modes* of Munich, gave strong evidence of her desire for conquest; all the colours of the rainbow were tried, and those in every light, in order to ascertain what "best became her;" friends were appealed to, neighbours called into council; and it was not until the day before the ball that the dress in which she was actually to appear was finally decided upon.

What the police regulations of Munich were upon those occasions, history has not recorded, or whether the instructions of the Bavarian green-cloth for the regulation of carriages merely directed that the company should be set down with their horses' heads opposite to their tails; suffice it to say, that amidst a sort of civil warfare, eminently destructive to the panels, and seriously injurious to the poles, the general and the two Misses Klinkenberg were safely deposited at the palace.

At the foot of the golden and marble staircase, which forms one of the splendid features of this immense building, and which, upon this occasion, was lined by body guards, and plentifully sprinkled over with porters and pages, they were received and ushered up to the great hall, which, together with the hall of antiquities, was most magnificently illuminated; and after passing through a suit of apartments, each vieing with the preceding one in brilliancy of decoration and company, they reached the throne-room, in which the visitors were presented to his majesty previous to proceeding to the ball.

His majesty's reception of the veteran general was

gracious in the extreme; but when the royal eyes fell upon the animated countenance and sylph-like form of Amelia, the king seemed thunder-stricken. His majesty was graciously pleased to express his admiration aloud, and spoke of her beauty in a very audible tone to the Baron Stiffincroup and the Countess of Mugenstein, who were near him. Of Caroline the king said nothing; he merely bestowed upon her one of those gently approving smiles which great personages with white teeth are frequently pleased to confer; but of Amelia he continued to rave—continued to point her out to each new guest with whom he was on familiar terms, until at last, his majesty having gone through the ceremony of opening the ball with her serene highness the Princess Wilhelmina of Stumps Gigenstein, Amelia found herself approached by one of his majesty's chamberlains, who announced to her delighted ears that the sovereign had been graciously pleased to select her for his partner in the next quadrille.

What the Bavarian etiquette upon so striking and singular an occasion actually might be, we do not pretend to understand, but it was by no means difficult to perceive, by the looks and gestures of the five hundred beauties of the court, that the royal attention had created a sensation. Its immediate effect upon Caroline Klinkenberg was astounding; for no sooner did Baron Stiffincroup, prime minister in the Bavarian cabinet, perceive his majesty leading the elder Miss Klinkenberg to the highest place in the dance, than he bustled through the illustrious throng, and solicited the hand of the second Miss Klinkenberg as his partner in the same set.

As for Amelia, from the moment she felt the pressure of the white kid glove of the right hand of the king upon the sympathetic leather on her own left, she saw nothing, understood nothing that she heard, was conscious of nothing in the world but that she was existing in a sort of ecstatic dream, and that she was still actually on her feet swinging about the palace in company with her sovereign, who, as has already been remarked, in addition to his crown and dignity, possessed a person so fine, a face so handsome, and a figure so elegant, that the court resounded with murmurs of admiration—not quite unmixed with envy—at the beautiful performance of their gracious king and his graceful partner.

Baron Stiffincroup, who was tall, solemn, formal, and grey, was not particularly well adapted for waltzing, either by age or station, figure or activity; he went through the motions, and Caroline was as well pleased as the baron, when she found herself re-established at her gallant father's side, whence the premier had drawn her; but Amelia's career was not yet ended; she was destined to be the belle of the evening.

In spite of etiquette, in spite of the various claims which should have engaged the royal attention, the king graciously condescended to place her arm on his, and lead her, "nothing loath," to the room where refreshments were served; here he presented her—he himself—with ice; here offered her a wafer, while she stood the wonder of the gazing company, alone with him, and doing something very like flirting, in the centre of a circle whose sacred verge no subject's foot dare cross.

But even this was not all; in the plenitude of royal grace and condescension, his majesty plucked a half-blown rose from one of the vases which were ranged along the plateau, and, with a speech full of—more than gallantry—sentiment, presented it to his fair partner, from whom it seemed he parted most reluctantly when he surrendered her to the care of her father.

But as the flower blooms which the sun has ripened, even when that sun is set, Amelia, seated by the general's side, attracted crowds of gazers even though the king had left her; and she remained enjoying her triumph, and holding affectionately in her hand the rose which had been conferred upon her by the monarch.

Supper was announced, and trumpets rent the air; and as the folding doors of the banquet gallery were thrown open, music, the most melodious, burst upon the ear. Amelia lingered and looked around—for what?—presumptuous girl!—she felt dissatisfied and disappointed because the young king did not lead her to the table. She forgot that the Grand Duchess of Shuffelhausen would naturally be taken out by his majesty; and that, however much his kind heart and good taste might draw him to her side when etiquette permitted, there were certain things to be done and performed in his kingly capacity, with which neither kindness nor feeling could be permitted to interfere. Certain it is, that from the moment she saw him seated on his chair of state, surrounded by the officers of his household, approached with awe, and served with humility, amounting—or rather descending—almost to prostration, she sighed, and felt as if she were wearied with all that was near her; the banquet was tasteless, the music discordant, the gaiety painful.

Caroline, who had been led to supper by her last partner, enjoyed every thing she saw and heard; the one alloy to her gratification was the absence of Melfort; and although she looked forward to the morning when she should describe to him the events of the evening, as the reward of her present privation, she conquered all selfish feeling so far as to establish her character as a delightful companion in the mind of the young nobleman who had danced with her, and to create in his bosom, as it should seem, an interest not

much inferior to that which it appeared her animated sister had excited in the heart of the king.

Supper over, the company resumed dancing, but the king did not again present himself to the eyes of the fascinated Amelia. Baron Stiffincroup, however, went to General Klinkenberg, and taking him into a window, stated to him that he had it in command from the king to tell him that his majesty intended to confer upon him the order of St Hubert; that he could not imagine how his services and merits had been so long overlooked by his late father; and that he expected to see him at the next morning's levee, in order that he might have the pleasure of investing him with the riband. Klinkenberg felt hot, and cold, and bowed, and smiled, and was very much pleased; for singular as it may appear, the late king, for what reason nobody ever could discover, although frequently solicited, never would give Klinkenberg the order of St Hubert. Why he got it now, having given the reader some idea of Bavarian politics, we leave him to guess.

Seated in the carriage, on their return, what were the feelings of the three Klinkenbergs? Amelia was satisfied that the king was at her feet, and that the favour bestowed upon her father was merely a proof of his majesty's sincerity and devotion to her; but upon a subject so high she dared not trust herself to speak; so she declared herself tired, threw herself back in the coach, and closing her eyes, saw as it were in a vision the throne standing ready for her occupation; and while she (almost tenderly) pressed in her hand the withering flower which the sovereign had presented her, felt the sceptre of Bavaria within her grasp.

Caroline, who was no more tired than her sister, and who had no object in affecting to be so, talked over the whole party gaily and happily, and felt more at ease than at any previous period of the evening; and Klinkenberg, himself in high spirits at the result of his visit to court, chuckled at his attainment from the new king of a decoration which the old one never would bestow on him.

When next morning came, and breakfast was over, and General Klinkenberg on his road to Munich, as usual, came Captain Steinfeldt and Lieutenant Melfort; the latter was received by Caroline as he always was—both her hands were extended to receive his, and a smile, such as thrones cannot purchase nor kingdoms repay, greeted the young suitor (if such he might be considered) on his entrance to the boudoir. Amelia was gracious in her manner to Steinfeldt, and stretched forth her right hand, still seated, while her left most unconsciously rested on a vase in which hung droopingly the royal rose of Bavaria.

Amelia saw that the faded flower had caught the captain's eyes; she longed for him to ask some questions about it, but she was spared a protracted anxiety by Caroline's calling the attention of both the beaux to the "floral emblem" of her sister's triumph.

"Yes," said Amelia, "the king gave it me last night; we had danced together; and while he was handing me some ice, I happened to say I was fond of roses, and he was good enough to present it to me. It therefore becomes quite an historical rose, and I shall preserve it."

"Less productive of feuds, I hope," said Steinfeldt, "than the rival roses of England."

"And," said Melfort, "have you no royal rose to boast of, Caroline?"

"Not I, indeed," replied she: "Amelia was the favoured lady of the night."

"Oh, Caroline," interrupted Amelia, "don't say so! I am sure he was very attentive to the Princess Wilhelmina of Stumps Gigenstein."

"Whom do you mean by *he*, Miss Klinkenberg?" said the captain.

"Why, Captain Steinfeldt," said Amelia, half angry with him, and half ashamed of herself, "I mean—I mean—the king!"

"Oh!" said the captain, bowing, "I only asked. You seem to have made considerable progress in your acquaintance with his majesty."

"Yes," said the young lady; "and, besides, this rose—which is faded, I confess—at this point of her conversation she caressed it, and played with its leaves—'besides this, the king has given papa the order of—what is it, dear Caroline?—St Hubert.'"

"Indeed!" said Steinfeldt, whose thoughts suddenly flew from the order to the abbey of St Hubert, in the Netherlands, which at the moment he did not think at all an unsuitable receptacle either for the king or the general. "Why, you come from court loaded with honours!"

"That Princess Wilhelmina of Stumps Gigenstein is very plain," said Amelia.

"She is to be our queen, I am told," said the captain. Amelia said nothing, but her lip quivered and her cheek flushed. Steinfeldt saw what was passing in her mind.

"Some people have destined the king for an English lady," said Steinfeldt; "but the objection to the match, which is insuperable, is, that she is a subject."

Amelia coloured again, and it was with something like a consciousness, founded, as it would seem, upon what the king had whispered the night before, that she said, "Is that objection insuperable? Our king is very English in his opinions and feelings, and in England kings marry subjects."

"Not now," said Steinfeldt. "Come, Amelia, let us join Caroline and Melfort."

"Oh, I cannot walk to-day," said Amelia; "I am

tired—tired beyond belief; besides, I should not like to leave home until—until —”

She would have said, until “I know the king will be engaged at court at the levee;” for she was full of the idea that he would visit Starenberg. Steinfelt took his chaco, and, humming a tune, walked to the open door of the boudoir, then played with the jasmynes and honeysuckles that twined through the columns of the portico, then stepped down one step, then down another, and finally walked himself off; his pride was hurt, his heart was pained. In one short evening Amelia seemed to have changed her whole character, and, dazzled by the attentions of her sovereign, appeared to have lost the recollection of all that had been passing during the previous half year. Steinfelt made every allowance for the peculiarity of the circumstances, and the nature of the trial to which she had been exposed, but he could not discuss or argue the topic with her; he did not love her less than he did the day before, but the day before he did not know that he loved her so much; the approach of a rival, and such a rival as a king, gave a stimulus to his feelings, and they overcame him; his only safety was in a retreat: like a good tactician, he adopted it.

Amelia saw him depart without concern, without emotion; the first advantage she took of his absence was to cross the room and re-arrange those ringlets of hers, before the looking-glass: the king had praised her ringlets and her eyes: and when she heard footsteps in the antechamber, she hurried back to the sofa with a fluttering heart—perhaps he was come—perhaps a chamberlain, an usher, a page—but no!

When the “benighted” general returned in the evening, Amelia’s inquiries were numerous. The ceremony of investiture occupied about three minutes. The court was crowded, and the king had only spoken a few words to Klinkenberg; but those few words were important, and sounded like the music of sweet bells in Amelia’s ear.

“General,” said his majesty, “I am going very soon to look at Starenberg. I think I should like it for a summer residence.”

These words the general repeated merely as a commonplace expression of the king’s intention. But Amelia read them differently. He had never been to Starenberg—never thought he should like it as a summer residence, until he had seen her—and he was coming *very soon*. It seemed as if her towering hopes were to be realised. Nor could she look at the glittering decoration which sparkled on her father’s breast without believing herself to have been the cause of its appearance there.

Steinfelt was not present when the general returned—he had made some plea for being away from Starenberg for two days, during which period Amelia continued in a state of feverish agitation, which none but ladies who have flown at quarries as high as hers can possibly appreciate; nor did the placid happiness of Caroline and Melfort at all disturb her. The rose was quite dead, but yet its withered stalk was her solace; and hour after hour passed in anxious expectation of the event which, as she reasonably enough believed, was destined to decide her fate.

One evening, the fourth after the ball, the general, Amelia, Melfort, and Caroline, were sitting in the garden pavilion, when a servant was seen hurrying along the walk which led to it, holding in his hand a letter. The very sight of a letter in the existing state of Amelia’s mind threw her into a terrible agitation; but when she heard her father exclaim as he read the superscription, “from the palace,” it was with difficulty she could retain her seat or her senses.

“How did this come?” said the general to his servant.

“By an orderly, general,” replied the servant.

“Where are my spectacles?” said the general.

“I will read it, papa,” said Amelia, “for you.”

“Child,” said the knight of St Hubert, “read it!

—it comes from the king’s secretary, and is marked “private and confidential”—let me see—”

Saying which, the general having placed “his spectacles on nose,” read—first to himself, and secondly aloud—what follows.

“Private.—Dear General, the king proposes, I believe, to visit Starenberg to-morrow about one o’clock. He wishes to avoid all ceremony, but as I thought, *under the peculiar circumstances of his visit*, you might wish to be there, I have written to let you know what I believe to be his majesty’s intention. It may be as well to say to any body that I have apprised you of it.—Ever yours, dear general, C. PENANINK.”

“To-morrow!” murmured Amelia, in a suppressed tone.

“Now, what had we best do?” said Klinkenberg. “I suppose, young ladies, you will take care that a collation is prepared for his majesty?”

“I will take care of that, sir,” said Amelia.

“Why,” said Melfort, “if the reports of royal visits are at all correct, collations form no inconsiderable portion of the performance. A court party in progress takes more feeding than a steam-engine.”

“The king would make this place very gay if he came to live here,” said the general. “It is very odd—I thought by his manner the other day that he meant to come, but —”

“I think,” said Caroline, “gay as the king’s residence may make it, we are much happier in truth without him: living in the confines of a court is like living on a tight rope; it requires a constant effort to

keep oneself balanced, while an attempt to jump is most likely to produce a fall.”

“Figurative as you are, Caroline,” said Melfort, “depend upon it you are right; however, I suspect the palace is not the object of the king’s visit.”

“What then, Melfort?” said the general.

“It is said, sir,” said Melfort, “that Amelia has caught the king’s heart.”

“Psha, psha!” said Klinkenberg; “pray let me hear nothing of the sort. Ridiculous!” and so the conversation ended.

Nobody could adequately describe the hurry and flurry, and bustling and scrambling, in which the evening was passed, nor the renewal of all the efforts in the morning, of the Klinkenberg family, to complete the preparations for the reception of the king. The Gunter of Munich, on the shortest notice, had before noon spread a banquet in the large saloon which opened into the garden, and the old plate of the Klinkenbergs was paraded upon temporary sideboards in the recesses. The choicest fruits, the finest wines, every thing that could gratify the royal palate, were furnished forth; and by one o’clock it was announced that the king might come whenever he pleased.

Early in the morning, however, Caroline and Melfort had a conversation the most interesting of their lives. The orderly who had brought the general’s letter from Count Penanink, the secretary, had also brought orders from the commander-in-chief to Captain Steinfelt and Lieutenant Melfort to join their regiment, with their troop now doing duty as the king’s guard, at Starenberg: they were to march the following day. The nature of this conversation the reader may guess. Melfort made the declaration which Caroline had long expected; and knowing her sentiments with regard to Melfort, there can be little doubt how she received it: suffice it to say that Melfort was the happiest of men.

Steinfelt, who was aware of Melfort’s intentions, although too much piqued and mortified by Amelia’s recent conduct to risk an interview with her on his return, addressed to her a letter, explanatory of his feelings, and requiring an answer to the offer of his attachment, to which a cold reply and refusal was returned.

“Heartless, cruel girl!” said Steinfelt, as he dashed this note upon the table. “She whom I idolised—she who has been all the world to me, and whose faith is as much pledged to me as if we had sworn to love eternally—she whom it would have been my pride to have taken into the bosom of my family—she to whom I looked as the comfort of my life, the —”

“Turn out the guard!” cried the sentry at the gates. Away went Amelia’s letter crumpled into the sabretache; on went the sword and chaco; down stairs ran the captain, and in two minutes, mounted on his pawing charger, he was at the head of his men.

A royal carriage drove into the quadrangle—it was not the king; Count Penanink, Rodantape, the surveyor of the works, and Skafield, the king’s architect, were the inhabitants of the vehicle. The guard turned in: the architect and surveyor proceeded up the great staircase, and Count Penanink went to Klinkenberg’s apartments.

“Do you think, count, that the king is likely to reside here?” said Klinkenberg.

“Upon my word,” said the count, “I cannot venture to surmise at present: there are great attractions here”—Amelia’s heart beat—“and circumstances may occur which would render it a very agreeable residence. The distance from town is so convenient—not that I am at all aware what his majesty’s intentions are—it was quite sudden his majesty’s desire of visiting it—I —”

This was all honey and nectar to Miss Klinkenberg, who was just preparing to question the count, when the saloon door was thrown violently open, and one of the king’s servants ran in unceremoniously, and exclaimed, “Count, count! the king is coming!”

Away went Penanink, away went Klinkenberg, leaving Amelia in a state of dreadful agitation, and Caroline in a dreadful fit of laughing: to see the cold, cautious secretary, who had been measuring out his words with the most precise primness, take a start as if the palace were on fire, and to see her venerable and venerated father regenerated into a racer, by the magical sound of “the king is coming,” were too much for her unsophisticated mind, and it was only after a severe lecture from her majesty elect, that she could summon gravity enough to look out of the windows to see the arrival.

At length the moment arrived: Amelia could hear her own heart beat; her father’s voice sounded in the anteroom; and forthwith the doors were thrown open, and there entered Count Penanink, Captain Spyhausen, and Major Sneakenburg, the equerries, Mr Skafield, the architect, Mr Rodantape, the surveyor-general, and Lieutenant Melfort, of the king’s guard.

Considering these inferiors to be but the leaders of the procession, the head of the column, as her father would have phrased it, Amelia was all smiles and graciousness; but when she heard her father give directions to throw open the room where stood the royal collation, and Count Penanink came up to her and offered her his arm to lead her to table, she felt over-

whelmed with wonder and amazement. Her feelings were too powerful to permit her to be silent.

“Where is the king, sir?” said she to the count, as they passed from one room to the other.

“He is gone,” said the count; “he never eats luncheons.”

“Gone!” said Amelia—“luncheon!”

“Yes,” replied the count, “he is quite delighted with the palace, and means almost immediately to take up his residence here.”

Amelia felt in a trance—a dream—a dreadful dream. “Mr Rodantape!” cried General Klinkenberg, “will you sit next my eldest daughter?”

Poor Amelia! instead of the Bavarian monarch, to have the surveyor-general of the works placed at her left hand!

At this period it became a question with Miss Amelia Klinkenberg whether she would faint or not; but still hoping that the king’s absence was owing to some etiquette of which she was not aware, she resolved to endure what was actually in progress, and devote herself to the count, from whom she hoped to extract some courtly intelligence.

“You are acquainted with Captain Steinfelt?” said the count.

“Yes,” stammered Amelia, rather wavering by the question—“Yes.”

“The king has made him a happy man this morning,” said the count; “he has given him one of the best appointments he could hold.”

“Indeed!” said Amelia.

“And one which will afford him a most delightful opportunity of travelling,” said the count, “for he will go on the special mission which is to be sent to bring home our new queen.”

To this Amelia made no answer, for she could not utter.

“And though,” continued the count, “in consequence of the king’s choosing to live here after his marriage, your father will lose the advantage of these apartments, still —”

At this period the option of fainting or not was no longer left to Miss Amelia Klinkenberg—she fell senseless from her chair, and escaped the contamination of sitting next the surveyor-general of the works, by being carried in a lifeless state to her bedroom.

In three weeks from that day, the king of Bavaria was married; in six weeks from that day, Caroline became the wife of Melfort; in three months from that day, Steinfelt was united to the wealthy Dowager Duchess of Oldanfatt; and twenty years from that day, Miss Amelia Klinkenberg was Miss Amelia Klinkenberg still, and without any prospect of changing her condition for the better.

Proud and poor, the disappointment of hopes which never had any foundation except in her own vanity, and which converted the gracious condescension of a monarch into the devotion of a lover, preyed upon her mind, and induced her prudentially to declare her resolution of never marrying; a resolution which, as the story of her mistake about the king and her misconduct towards Steinfelt got known, nobody ever persuaded her to rescind; and she passes her time now in preaching prudence to her lovely nieces, with a constant exhortation to them never to give up the certainty of happiness for the chance of splendour, but always to recollect the homely English proverb, that “ONE BIRD IN HAND IS WORTH TWO IN THE BUSH.”—Keepsake, 1832.

A FAMILY OF CRUSOES.

It may not be generally known to the people of Scotland, that within the verge of this northern kingdom, there exists (or very lately existed) a family of human beings in an almost desert island, removed out of sight of land, and holding communication with the rest of their species but twice in the twelve months. The name of this desolate isle is Rona, or more correctly North Rona, and is situated in the Northern Ocean, at the distance of sixteen leagues west from the Butt of Lewis, one of the largest of the Hebridean Isles. This island, which measures about a mile in length and half a mile in breadth, where widest, has been rarely visited either by ships or travellers, and has been the subject of a variety of fanciful descriptions. It might have remained much longer in this almost “undiscovered” condition, had it not been a few years ago visited by Dr John Macculloch, who made it the object of one of his mineralogical excursions, and who has presented us with a description of the island and its inhabitants. The Doctor, it seems, found great difficulty in landing, in consequence of the most accessible point being the face of a precipitous cliff, fifty or sixty feet in height. The disembarkation of himself and boat’s crew did not pass unobserved by the chief inhabitant, who, like his prototype Robinson Crusoe, in spying the landing of the savages, took care to keep aloof from the strangers; and who, on their surmounting the cliff, fairly took to his heels. Being, however, brought to by means of a well-directed blast of Gaelic, sent after him by one of the boatmen, and his friendship purchased by a roll of tobacco, the Doctor found himself at liberty to inspect the territory in all its parts, and to extract an account of the mode of living of the single family by which it was tenanted. “The southern cliffs,” says he, “range from thirty to sixty feet in height, running out into flat ledges at the western extremity; but on the north side they reach to five hundred feet, and present a formidable aspect, whitened by the tremendous breach of the

sea as it rolls on from the northward. Here, among other openings, there is an immense cave, with a wide aperture, into which the waves break with the noise of thunder. Over a large space, the whole ground, at an elevation of two hundred feet, is washed away to the bare foundation; large masses of rock being frequently thrown up, and carried high along the level land, as if they were mere pebbles on a sea-beach. Rona can be no peaceful solitude, when the half of it is thus under water, and the solid dash then made against it must cover the whole, in gales of wind, with a continual shower of spray. From the lower western angle, the land rises with a gentle and even swell towards the north and east; but having no inequality of ground to afford the least shelter, it is necessarily swept by every blast. The surface is, nevertheless, green, and every where covered with a beautiful compact turf, except where broken up for cultivation, for the space of a few acres in the middle and elevated part. The highest point is near the north-eastern end; and hence, in clear weather, the lofty hills of Sutherland are visible in the horizon. It is the total seclusion of Rona from all the concerns of the world, which confers on it that intense character of solitude with which it seemed to impress us all. No ship approaches in sight, and seldom is land seen from it. A feeling of hope never leaves the vessel while she can float, and while there is a possibility of return to society; but Rona is forgotten, unknown, for ever fixed immovable in the dreary and waste ocean. There was at one period, according to doubtful tradition, a chapel in the island dedicated to St Ronan, the patron saint of seals, which was fenced by a stone wall, but of this there are now no remains. Whatever was the number of families once resident, and it is said there were always five, there is now but one. The tenant is a cottar, as he cultivates the farm on his employer's account. There seem to have been six or seven acres cultivated in barley, oats, and potatoes, but the grain was now housed. The soil is good, and the produce appeared to have been abundant. The family is permitted to consume as much as they please; and it was stated that the average surplus paid to the tacksman amounted to eight bolls of barley. In addition to that, he is bound to find an annual supply of eight stones of feathers, the produce of the gannets. Besides all this, the island maintains fifty small sheep. The wool of these is of course reserved for the tacksman; but as far as we could discover, the tenant was as unrestricted in the use of mutton as in that of grain and potatoes. Twice in the year, that part of the produce which is reserved is thus taken away, and in this manner is maintained all the communication which North Rona has with the external world. The return for all these services, in addition to his food and that of his family, is the large sum of two pounds a-year. But this is paid in clothes, not in money; and as there were six individuals to clothe, it is easy to apprehend they did not abound in covering. I must add to this, however, the use of a cow, which was brought from Lewis, when in milk, and changed when unserviceable. From the milk of his ewes, the tenant contrives to make cheeses, resembling those for which St Kilda is so celebrated. There is no peat in the island, but its place is well enough supplied by turf. During the long discussions whence all this knowledge was procured, I had not observed that our conference was held on the top of the house; roof it could not be called. It being impossible for walls to resist the winds of this boisterous region, the house is excavated in the earth, as if it were the work of the Greenlanders. What there is of wall, rises for a foot or two above the surrounding irregular surface, and the adjacent stacks of turf help to ward off the violence of the gales. The flat roof is a solid mass of turf and straw, the smoke issuing out of an aperture near the side of the habitation. The very entrances seemed to have been contrived for concealment or defence, and it could not be perceived till pointed out. This is an irregular hole, about four feet high, surrounded by turf; and on entering it, with some precaution, we found a long tortuous passage, somewhat resembling the gallery of a mine, but without a door, which conducted us into the penetralia of the cavern. The interior resembled the prints which we have seen of a Kamtschatka hut. Over the embers of a turf fire sat the ancient grandmother nursing an infant, which was nearly naked. From the rafters hung festoons of dried fish; but scarcely an article of furniture was to be seen, and there was no light but that which came through the smoke-hole. There was a sort of platform, or dais, on which the fire was raised, where the old woman and her charge sat; and one or two niches, excavated laterally in the ground, and laid with ashes, seemed to be the only bed-places. Why these were not furnished with straw, I know not; and of blankets, the provision was as scanty as that of the clothes; possibly, ashes may make a better and softer bed than straw; but it is far more likely that this insular family could not be forced to make themselves more comfortable. This was certainly a variety in human life worth studying. Every thing appeared wretched enough; a smoky subterranean cavern; rain and storm; a deaf octogenarian grandmother; the wife and children half naked; and to add to all this, solitude, and a prison from which there was no escape. Yet the family were well fed, seemed contented, and expressed little concern as to what the rest of the world was doing. To tend the sheep, and house the winter furring; to dig the ground, and reap the harvests in their seasons; to hunt wild-fowl and catch fish; to fetch water from the pools,

keep up the fire, and rock the child to sleep on their knees, seemed occupation enough, and the society of the family itself, society enough. The women and children, indeed, had probably never extended their notions of a world much beyond the precincts of North Rona; the chief himself seemed to have few cares or wishes that did not centre in it; his only desire being to go to Lewis to christen his infant—a wish in another year he could have gratified." Such is an abridgement of the interesting account given by Macculloch of this distant and solitary isle, and the human beings who inhabit it. My readers have here presented to their view the picture of a family, which many may consider as at the lowest and most hapless condition of any in Great Britain or its adjacent islands; yet the moralist will be delighted to discover, that with all the disadvantages of solitude and desertion, there is even a large amount of actual happiness, comfort, and virtue, in this remote and limited territory.

BIOGRAPHIC SKETCHES.

WILLIAM GIFFORD,

Late Editor of the Quarterly Review.

AMONG narratives which illustrate the power of the love of knowledge in overcoming the opposition of circumstances, there are few more interesting than that which has been given us of his early life, by the late William Gifford. Mr Gifford was born in 1755, at Ashburton, in Devonshire. His father, although the descendant of a respectable and even wealthy family, had early ruined himself by his wildness and prodigality; and even after he was married, had run off to sea, where he remained serving on board a man-of-war for eight or nine years. On his return home, with about a hundred pounds of prize-money, he attempted to obtain a subsistence as a glazier, having before apprenticed himself to that business; but in a few years he died of a broken-down constitution before he was forty, leaving his wife with two children, the youngest only about eight months old, and with no means of support except what she might make by continuing the business, of which she was quite ignorant. In about a twelvemonth she followed her husband to the grave. "I was not quite thirteen," says her son, "when this happened; my little brother was hardly two; and we had not a relation nor a friend in the world."

His brother was now sent to the workhouse, and he was himself taken home to the house of a person named Carlile, who was his godfather, and had seized upon whatever his mother had left, under the pretence of repaying himself for money which he had advanced to her. By this person, William, who had before learned reading, writing, and a little arithmetic, was sent again to school, and was beginning to make considerable progress in the last branch of study; but in about three months his patron grew tired of the expense, and took him home, with the view of employing him as a ploughboy. An injury, however, which he had received some years before on his breast, was found to unfit him for this species of labour; and it was next resolved that he should be sent out to Newfoundland, to assist in a storehouse. But upon being presented to the person who had agreed to fit him out, he was declared to be "too small"—and this scheme also had to be abandoned. "My godfather," says he, "had now humbler views for me, and I had little heart to resist anything. He proposed to send me on board one of the Torbay fishing-boats; I ventured, however, to remonstrate against this, and the matter was compromised by my consenting to go on board a coaster. A coaster was speedily found for me at Brixham, and thither I went when little more than thirteen."

In this vessel he remained for nearly a twelvemonth. "It will be easily conceived," he remarks, "that my life was a life of hardship. I was not only 'a ship-boy on the high and giddy mast,' but also in the cabin, where every menial office fell to my lot; yet, if I was restless and discontented, I can safely say it was not so much on account of this, as of my being precluded from all possibility of reading; as my master did not possess, nor do I recollect seeing during the whole time of my abode with him, a single book of any description except the 'Coasting Pilot.'"

While in this humble situation, however, and seeming to himself almost an outcast from the world, he was not altogether forgotten. He had broken off all connection with Ashburton, and where his godfather lived; but "the women of Brixham," says he, "who travelled to Ashburton twice a-week with fish, and who had known my parents, did not see me without kind concern, running about the beach in a ragged jacket and trousers." They often mentioned him to their acquaintances at Ashburton; and the tale excited so much commiseration in the place, that his godfather at last found himself obliged to send for him home. At this time he wanted some months of fourteen. He proceeds with his own story as follows:—

"After the holidays, I returned to my darling pursuit—arithmetic: my progress was now so rapid, that in a few months I was at the head of the school, and qualified to assist my master (Mr E. Furlong) on any extraordinary emergency. As he usually gave me a trifle on these occasions, it raised a thought in me that by engaging with him as a regular assistant, and undertaking the instruction of a few evening scholars, I might, with a little additional aid, be enabled to support myself. God knows my ideas of support at this

time were of no very extravagant nature. I had, besides, another object in view. Mr Hugh Smerdon (my first master) was now grown old and infirm; it seemed unlikely that he should hold out above three or four years; and I fondly flattered myself, that, notwithstanding my youth, I might possibly be appointed to succeed him. I was in my fifteenth year when I built these castles; a storm, however, was collecting, which unexpectedly burst upon me, and swept them all away.

On mentioning my little plan to Carlile, he treated it with the utmost contempt; and told me, in his turn, that, as I had learned enough, and more than enough, at school, he must be considered as having fairly discharged his duty (so, indeed, he had); he added, that he had been negotiating with his cousin, a shoemaker of some respectability, who had liberally agreed to take me without a fee as an apprentice. I was so shocked at this intelligence, that I did not remonstrate, but went in sullenness and silence to my new master, to whom I was soon after bound, till I should attain the age of twenty-one.

Up to this period his reading had been very limited, the only books he had perused, besides the Bible, with which he was well acquainted, having been a black-letter romance, called *Parismus* and *Parismenes*, a few old magazines, and the *Imitation of Thomas à Kempis*. "As I hated my new profession," he continues, "with a perfect hatred, I made no progress in it, and was consequently little regarded in the family, of which I sank by degrees into the common drudge: this did not much disquiet me, for my spirits were now humbled. I did not, however, quite resign my hope of one day succeeding to Mr Hugh Smerdon, and therefore secretly prosecuted my favourite study at every interval of leisure. These intervals were not very frequent; and when the use I made of them was found out, they were rendered still less so. I could not guess the motives for this at first; but at length I discovered that my master destined his youngest son for the situation to which I aspired."

I possessed at this time but one book in the world: it was a treatise on algebra, given to me by a young woman who had found it in a lodging-house. I considered it as a treasure; but it was a treasure locked up; for it supposed the reader to be well acquainted with simple equations, and I knew nothing of the matter. My master's son had purchased Fenning's *Introduction*: this was precisely what I wanted—but he carefully concealed it from me, and I was indebted to chance alone for stumbling upon his hiding-place. I sat up for the greatest part of several nights successively, and, before he suspected that his treatise was discovered, had completely mastered it. I could now enter upon my own, and that carried me pretty far into the science. This was not done without difficulty. I had not a farthing on earth, nor a friend to give me one; pen, ink, and paper, therefore (in despite of the flippant remark of Lord Orford), were for the most part as completely out of my reach as a crown and sceptre. There was, indeed, a resource; but the utmost caution and secrecy were necessary in applying to it. I beat out pieces of leather as smooth as possible, and wrote my problems on them with a blunted awl; for the rest my memory was tenacious, and I could multiply and divide by it to a great extent."

No situation, it is obvious, could be more unfavourable for study than this; and yet we see how the eager student succeeded in triumphing over its disadvantages, contriving to write and calculate even without paper, pens, or ink, by the aid of a piece of leather and a blunted awl. Where there is a strong determination to attain an object, it is generally sufficient of itself to create the means; and almost any means are sufficient. We mistake in supposing that there is only one way of doing a thing, namely, that in which it is commonly done. Whenever we have to prove it, we find how rich in resources is Necessity; and how seldom it is that, in the absence of the ordinary instrument, she has not some new invention to supply its place. This is a truth which studious poverty has often had experience of, and been all the better for experiencing; for difficulties so encountered and subdued not only whet ingenuity, but strengthen a man's whole intellectual and moral character, and fit him for struggles and achievements in after-life, from which other spirits less hardly trained turn away in despair.

At last, however, Gifford obtained some alleviation of his extreme penury. "He had scarcely, he tells us, known poetry even by name, when some verses, composed by one of his acquaintances, tempted him to try what he could do in the same style, and he succeeded in producing a few rymes. As successive little incidents inspired his humble muse, he produced several more compositions of a similar description, till he had got together about a dozen of them. "Certainly," says he, "nothing on earth was ever so deplorable;" but such as they were, they procured him not a little fame among his associates, and he began at last to be sometimes invited to repeat them to other circles."

"The repetitions of which I speak," he continues, "were always attended with applause, and sometimes with favours more substantial; little collections were now and then made, and I have received sixpence in an evening. To one who had long lived in the absolute want of money, such a resource seemed a Peruvian mine: I furnished myself by degrees with paper, &c., and, what was of more importance, with

books of geometry and of the higher branches of algebra, which I cautiously concealed. Poetry, even at this time, was no amusement of mine: it was subservient to other purposes; and I only had recourse to it when I wanted money for my mathematical pursuits."

But even this resource was soon taken from him. His master, having heard of his verse-making, was so incensed both at what he deemed the idleness of the occupation, and especially at some satirical allusions to himself, or his customers, upon which the young poet had unwisely ventured, that he seized upon and carried away all his books and papers, and even prohibited him in the strictest manner from ever again repeating a line of his compositions. This severe stroke was followed by another, which reduced him to utter despair. The master of the free school, to whom he had never resigned the hope of succeeding, died, and another person was appointed to the situation, not much older than Gifford, and who, he says, was certainly not so well qualified for it as himself.

"I look back," he proceeds, "on that part of my life which immediately followed this event with little satisfaction; it was a period of gloom and savage unsociability; by degrees I sunk into a kind of corporeal torpor; or, if roused into activity by the spirit of youth, wasted the exertion in splenetic and vexatious tricks, which alienated the few acquaintances which compassion had yet left me."

But his despondency and discontent seem to have gradually given way to the natural buoyancy of his disposition; some evidences of kindly feeling from those around him tended a good deal to mitigate his recklessness; and especially as the term of his apprenticeship drew towards a close, his former aspirations and hopes began to return to him. He had spent, however, nearly six years at his ungenial employment, before any decided prospect of deliverance opened upon him. "In this humble and obscure state," says he, "poor beyond the common lot, yet flattering my ambition with day dreams which perhaps would never have been realised, I was found, in the twentieth year of my age, by Mr William Cookesley, a name never to be pronounced by me without veneration. The lamented doggerel which I have already mentioned, and which had passed from mouth to mouth among people of my own degree, had by some accident or other reached his ear and given him a curiosity to inquire after the author." Mr Cookesley, who was a surgeon, and not rich, having learnt Gifford's history from himself, became so much interested in his favour, that he determined to rescue him from his obscurity. "The plan," says Gifford, "that occurred to him was naturally that which had so often suggested itself to me. There were, indeed, several obstacles to be overcome. My handwriting was bad, and my language very incorrect; but nothing could slacken the zeal of this excellent man. He procured a few of my poor attempts at rhyme, dispersed them amongst his friends and acquaintance, and, when my name was become somewhat familiar to them, set on foot a subscription for my relief. I still preserve the original paper; its title was not very magnificent, though it exceeded the most sanguine wishes of my heart. It ran thus: 'A subscription for purchasing the remainder of the time of William Gifford, and for enabling him to improve himself in writing and English grammar.' Few contributed more than five shillings, and none went beyond ten and sixpence; enough, however, was collected to free me from my apprenticeship, and to maintain me for a few months, during which I assiduously attended the Rev. Thomas Smerdon."

The rest of the story may be very compendiously told. The difficulties of the poor scholar were now over, for his patrons were so much pleased with the progress he made during this short period, that, upon its expiration, they renewed their bounty, and maintained him at school for another year. "Such liberality," he remarks, "was not lost upon me; I grew anxious to make the best return in my power, and I redoubled my diligence. Now that I am sunk into indolence, I look back with some degree of scepticism to the exertions of that period." In two years and two months from what he calls the day of his emancipation, he was pronounced by his master to be fit for the university; and a small office having been obtained for him by Mr Cookesley's exertions at Oxford, he was entered of Exeter College, that gentleman undertaking to provide the additional means necessary to enable him to live till he should take his degree. Mr Gifford's first patron died before his protégé had time to fulfil the good man's fond anticipations of his future celebrity; but he afterwards found, in Lord Grosvenor, another much more able, though it was impossible that any other could have shown more zeal, to advance his interests. A long and prosperous life, during which he acquired a distinguished name in the literary world, was the ample compensation for the humiliation and hardships of his youth. He was the editor, for many years, of the "Quarterly Review," which was placed under his management at its commencement in 1809, and which attained the most distinguished success, in a great degree, through his judicious and careful attention to its conduct. The narrative from which we have extracted the preceding pages, and which is so interestingly written that we have generally preferred retaining the original words in our abridgement, is prefixed to his English version of Juvenal, the first edition of which appeared in 1802. Mr Gifford died in London on the 31st of De-

cember 1826, in the seventy-first year of his age. It is a beautiful circumstance in his history, and one which shows how a generous act sometimes receives even a worldly reward, that he left the bulk of his fortune to the son of his first most kind and disinterested patron, Mr Cookesley.—*Library of Entertaining Knowledge.*

AMERICAN PASSENGER PIGEONS.

Of these animals, and the vast multiplicity of their numbers, we have had various accounts by travellers on whose details faith could be placed; but no one seems to have given so thorough an account of the character and numbers of this species of bird as the ingenious Audubon, in his Ornithological Biography, a work of great interest both to the naturalist and general reader. "The body of the passenger pigeon," says he, "is of an elongated oval form, steered by a long well-plumed tail, and propelled by well-set wings, the muscles of which are very large and powerful for the size of the bird. When an individual is seen gliding through the woods and close to the observer, it passes like a thought; and on trying to see it again, the eye searches in vain; the bird is gone. The multitudes of wild pigeons in our woods are astonishing. Indeed, after having viewed them so often, and under so many circumstances, I even now feel inclined to pause, and assure myself that what I am going to relate is fact. Yet I have seen it all, and that too in the company of persons who like myself were struck with amazement."

In the autumn of 1813, I left my house at Henderson, on the banks of the Ohio, on my way to Louisville. In passing over the Barrens, a few miles beyond Hardensburgh, I observed the pigeons flying from north-east to south-west in greater numbers than I thought I had ever seen them before; and feeling an inclination to count the flocks that might pass within the reach of my eye in one hour, I dismounted, seated myself on an eminence, and began to mark with my pencil, making a dot for every flock that passed. In a short time, finding the task which I had undertaken impracticable, as the birds poured in in countless multitudes, I rose, and counting the dots then put down, found that 163 had been made in twenty-one minutes. I travelled on, and still met more the farther I proceeded. The air was literally filled with pigeons; the light of noon-day was obscured as by an eclipse; the dung fell in spots not unlike melting flakes of snow; and the continued buzz of wings had a tendency to lull my senses to repose. Whilst waiting for dinner at Young's inn, at the confluence of Salt River with the Ohio, I saw at my leisure immense legions still going by, with a front reaching far beyond the Ohio on the west, and the beechwood forests directly on the east of me. Not a single bird alighted; for not a nut or acorn was that year to be seen in the neighbourhood.

Before sunset, I reached Louisville, distant from Hardensburgh fifty-five miles. The pigeons were still passing in undiminished numbers, and continued to do so for three days in succession. The people were all in arms. The banks of the Ohio were crowded with men and boys, incessantly shooting at the pilgrims, which there flew lower as they passed the river. Multitudes were thus destroyed. For a week or more, the population fed on no other flesh than that of pigeons, and talked of nothing but pigeons. The atmosphere, during this time, was strongly impregnated with the peculiar odour which emanates from the species.

It may not perhaps be out of place to attempt an estimate of the number of pigeons contained in one of those mighty flocks, and of the quantity of food daily consumed by its members. The inquiry will tend to show the astonishing bounty of the great Author of Nature in providing for the wants of his creatures. Let us take a column of one mile in breadth, which is far below the average size, and suppose it passing over us without interruption for three hours at the rate mentioned above, of one mile in the minute. This will give us a parallelogram of 180 miles by 1, covering 180 square miles. Allowing two pigeons to the square yard, we have one billion, one hundred and fifteen millions, one hundred and thirty-six thousand pigeons in one flock. As every pigeon daily consumes fully half a pint of food, the quantity necessary for supplying this vast multitude must be eight millions seven hundred and twelve thousand bushels per day.

As soon as the pigeons discover a sufficiency of food to entice them to alight, they fly round in circles reviewing the country below. During their evolutions on such occasions, the dense mass which they form exhibits a beautiful appearance, as it changes its direction, now displaying a glistening sheet of azure, when the backs of the birds come simultaneously into view, and anon suddenly presenting a mass of rich deep purple. They then pass lower, over the woods, and for a moment are lost among the foliage, but again emerge, and are seen gliding aloft. They now alight, but the next moment, as if suddenly alarmed, they take to wing, producing by the flappings of their wings a noise like the roar of distant thunder, and sweep through the forests to see if danger is near. Hunger, however, soon brings them to the ground. When alighted, they are seen industriously throwing up the withered leaves in quest of the fallen mast. The rear ranks are continually rising, passing over the main body, and alighting in front, in such rapid succession, that the whole flock seems still on wing. The quantity of

ground thus swept is astonishing; and so completely has it been cleared, that the gleaner who might follow in their rear would find his labour completely lost. Whilst feeding, their avidity is at times so great, that, in attempting to swallow a large acorn or nut, they are seen gasping for a long while, as if in the agonies of suffocation.

On such occasions, when the woods are filled with these pigeons, they are killed in immense numbers, although no apparent diminution ensues. About the middle of the day, after their repast is finished, they settle on the trees, to enjoy rest and digest their food. On the ground they walk with ease, as well as on the branches, frequently jerking their beautiful tail, and moving the neck backwards and forwards in the most graceful manner. As the sun begins to sink beneath the horizon, they depart *en masse* for the roosting-place, which not unfrequently is hundreds of miles distant, as has been ascertained by persons who have kept an account of their arrivals and departures.

Let us now, kind reader, inspect their place of nightly rendezvous. One of these curious roosting-places, on the banks of the Green River in Kentucky, I repeatedly visited. It was, as is always the case, in a portion of the forest where the trees were of great magnitude, and where there was little underwood. I rode through it upwards of forty miles, and crossing it in different parts, found its average breadth to be rather more than three miles. My first view of it was a fortnight subsequent to the period when they had made choice of it, and I arrived there nearly two hours before sunset. Few pigeons were then to be seen, but a great number of persons, with horses and waggons, guns and ammunition, had already established encampments on the borders. Two farmers from the vicinity of Russellville, distant more than a hundred miles, had driven upwards of three hundred hogs to be fattened on the pigeons which were to be slaughtered. Here and there the people employed in plucking and salting what had already been procured, were seen sitting in the midst of large piles of these birds. The dung lay several inches deep, covering the whole extent of the roosting-place, like a bed of snow. Many trees two feet in diameter, I observed, were broken off at no great distance from the ground; and the branches of many of the largest and tallest had given way, as if the forest had been swept by a tornado. Every thing proved to me that the number of birds resorting to this part of the forest must be immense beyond conception. As the period of their arrival approached, their foes anxiously prepared to receive them. Some were furnished with iron pots containing sulphur, others with torches of pine-knots, many with poles, and the rest with guns. The sun was lost to our view, yet not a pigeon had arrived. Every thing was ready, and all eyes were gazing on the clear sky, which appeared in glimpses amidst the tall trees. Suddenly there burst forth a general cry of 'Here they come!' The noise which they made, though yet distant, reminded me of a hard gale at sea passing through the rigging of a close-reefed vessel. As the birds arrived and passed over me, I felt a current of air that surprised me. Thousands were soon knocked down by the pole-men. The birds continued to pour in, the fires were lighted, and a magnificent as well as wonderful and almost terrifying sight presented itself. The pigeons, arriving by thousands, alighted every where, one above another, until sold masses, as large as hogsheads, were formed on the branches all round. Here and there the perches gave way under the weight with a crash, and falling to the ground, destroyed hundreds of the birds beneath, forcing down the dense groups with which every stick was loaded. It was a scene of uproar and confusion. I found it quite useless to speak or even to shout to those persons who were nearest to me. Even the reports of the guns were seldom heard, and I was made aware of the firing only by seeing the shooters reloading.

No one dared venture within the line of devastation. The hogs had been penned up in due time, the picking up of the dead and wounded being left for the next morning's employment. The pigeons were constantly coming, and it was past midnight before I perceived a decrease in the number of those that arrived. The uproar continued the whole night; and as I was anxious to know to what distance the sound reached, I sent off a man accustomed to perambulate the forest, who, returning two hours afterwards, informed me he had heard it distinctly when three miles distant from the spot. Towards the approach of day, the noise in some measure subsided; long before objects were distinguishable, the pigeons began to move off in a direction quite different from that in which they had arrived the evening before, and at sunrise all were that able to fly had disappeared. The howlings of the wolves had now reached our ears, and the foxes, lynxes, cougars, bears, racoons, opossums, and polecats, were seen sneaking off, whilst eagles and hawks of different species, accompanied by a crowd of vultures, came to supplant them, and enjoy their share of the spoil. It was then that the authors of all this devastation began their entry amongst the dead, the dying, and the mangled. The pigeons were picked up and piled in heaps, until each had as many as he could possibly dispose of, when the hogs were let loose to feed on the remainder.

Persons unacquainted with these birds might naturally conclude that such dreadful havoc would soon put an end to the species. But I have satisfied myself,

by long observation, that nothing but the gradual diminution of our forests can accomplish their decrease, as they not unfrequently quadruple their numbers yearly, and always at least double it."

EMIGRATION.

Mr FEROUSSON, having now examined Upper Canada, and remarked its suitability to emigration, crossed the frontiers of the province, though in the paper to which our attention has been directed he does not introduce the manner of his transit, and commenced his observations on the land and tillage in the United States: "In offering a few remarks upon the prospects of emigrants to the States," says he, "so many circumstances occur upon which it would be necessary to touch, that I almost shrink from the attempt. The great and interesting tie which must be severed when we leave our native country, and become the denizens of another, is a point which every man must settle for himself. Should it prove no impediment, he will find numerous and varied fields of agricultural enterprise presenting themselves in every quarter of the Union. He will find perfect security and independence, and, with ordinary good sense and good humour, can have no difficulty in maintaining friendly habits with his neighbours."

Two plans present themselves to the emigrant with capital in fixing his residence in the States. He may either purchase or occupy a farm in the old settled part of the country, or he may establish himself in some of the new or yet unsettled portions of the older States. The choice must be dependent on the means and character of the individual; but in either way the greatest risk of disappointment will always be found in fixing too hastily. I would strongly recommend to every man who may emigrate to Canada or the States, that he should allot some months to looking about him, ere he make a purchase, which it is not again so easy to exchange, should any of those numerous drawbacks present themselves which we are ever too apt to overlook in the excitement of the moment.

The arrangements for managing and disposing of the United States' public lands are very complete, and no difficulty or annoyance is likely to occur, if we except, perhaps, the delay in receiving the formal title or patent, occasioned by a heavy arrear of business in that department. This occasions, however, neither loss nor hazard, as the warrant of possession which every purchaser immediately receives, secures him in all the rights of property.

As it is impossible, within reasonable terms, to discuss *seriatim* the respective fitness of the different States for affording comfortable settlements to British emigrants, I shall detail my own personal observations, made upon the bank of the Hudson, above Albany, and in some parts of the Genesee country, and the information which I was enabled to collect from most respectable settlers in Michigan, as a fair sample of what is generally to be expected in the western country, leaving such inferences to be drawn as the statements deserve.

Various classes of settlers are to be found in the States, from the man of substance and capital to the rough backwoodsman and squatter; but a minute discussion of the several grades does not seem to be here required.

The first farm which I visited was in the immediate vicinity of Albany, forming part of the princely estate of Mr Van Ransaler. It contained 600 acres of fine mellow loam along the banks of the river, divided into fields by rail-fences, which cost here 4s. 6d. per sixteen feet, including boards, nails, and work—four rails, and about five feet high.

The crops chiefly raised are wheat, Indian corn, with pumpkins planted in the intervals or rows, oats, potatoes, and large quantities of timothy for hay. The buildings are of timber, handsome and convenient.

The farm was let some years ago at 2000 dollars, or £450, which in America seems to be a very high rent; but it must be recollected that the situation is particularly favourable from its close contact with the thriving city of Albany. A turnpike road upon Macadam's principle has commenced from Albany to the north, and six miles of it are already completed at an expense of £2000. It runs through the centre of this farm. It is at present the home farm of the eldest son of Mr Van Ransaler, who has imported, at considerable expense, from England, some fine short-horn stock, and which he is very successfully crossing with a judicious selection of native cows.

Although very fine cattle and sheep are to be found in some districts, I am satisfied that more may be done in the department of live-stock than in any other branch of American husbandry.

As the country becomes more populous, manufactures (already far advanced) will continue to increase, and fat stock, with dairy produce, must become objects of greater importance to the farmer than they have hitherto been. I met with a very intelligent cattle-dealer in Pennsylvania, who gave me much information on this subject. He and his partners deal, to a large extent, for the Philadelphia and New York markets. The system appeared to be perfectly organised. They purchase all the fat stock they can procure within a reasonable range of these cities, which are first disposed of to the butchers; and having thus cleared the field, they bring forward their droves from the back settlements or distant states, in such a succession as supplies, without glutting, the market.

Some of their cattle travel above 600 miles, and are two months on the road. He told me that he purchased 400 oxen every year from one Kentucky farmer, and he considers a stock farm to be a very sure and profitable concern. New York takes about 700 oxen a-week, when the demand is brisk. These weigh on an average about 55 stone, 14 lb. to a stone; and the price he receives is from £12 to £13 a-head. I was happy to find his opinion regarding live and dead weight to coincide nearly with my own. When *prime fat*, he reckons on a sink of one-third only on the live weight. He dislikes pumpkin-fed beef, and always insists on the animals which he purchases being fed, at least latterly, on maize. His expenses are high, much of his stock costing him above £2 a-head in road expenses; and he gives his head drivers 4s. 6d. a-day, with food for themselves and horses. His profits this season, he says, have been very handsome, and the trade in general is a good one to a steady man with sufficient capital. Town manure costs about 3d. a waggon load.

Horses, in all parts of the States and Canada, which I visited, and I believe universally, are to be remarked as superior in the qualities of action, strength, and figure. It is rare to pass a farmer's team without noticing horses worthy of being transferred to any gentleman's stud. They are kindly treated, well fed, and remarkably docile, of which I met with repeated instances, which would have not a little astonished our first-rate English coachmen. They are in general about 15 hands, or 15½, and cost from £10 to £25 each.

From Albany I proceeded about thirty miles up the river, where I spent several days with a friend, and in his company examined some farms then on sale in his neighbourhood.

To afford some idea of the expected prices and returns of old farms in this district, I shall subjoin a few notes which I made at the time of my visit.

1st, Captain Davenport's farm on the east bank of the Hudson. It contains 350 acres, 100 of which are in wood, hemlock, or Canada pine (the bark of which is in general use for tanning), maple, beech, &c. The soil is partly clay, partly sandy loam. A large portion is a rich holm, on the river side, and of the finest quality. The price demanded is 30 dollars, £7, 10s., per acre; but it would probably be bought for 25 dollars, or £5, 12s. The return might reasonably be expected to reach £112, 10s. clear of expenses, from the flat land, and £70 from the profit on a sheep stock on the upper portion of the farm: in the whole £182, 10s. The price would be, at £5, 10s., £1875, and an outlay on buildings, fences, and drains, of £1000 more, would still be within £3000, for which you have a return of above £180. In making this rough estimate, I resolved to be moderate in estimating returns, and liberal in calculating outlay, and am perfectly satisfied that an industrious Scotch farmer would easily realise a profit of £200 a-year.

It is to be noticed also, that one-half of the timber might be at once sold off without any detriment to the farm, and that I calculate upon the owner and his family drawing the ordinary articles of subsistence from the land, besides the above return.

2d, Next to this farm was that of Mr Knickerbocker, containing 275 acres. There is a fine holm also on this farm, and the upland seemed fully better than No. 1. This farm was let last year in shares for one year, and the owner received £63. The price asked is £4 per acre, or £1100, and £200 more would be required for houses, fences, &c. There is no more timber than is requisite for the use of the estate. This farm seemed to be in very indifferent order."—*Agricultural Journal*.—To be continued.

SAGACITY OF AN ELEPHANT.

"I was one day," says Jesse, in his *Gleanings in Natural History*, "feeding the poor elephant (who was so barbarously put to death at Exeter 'Change) with potatoes, which he took out of my hand. One of them, a round one, fell on the floor, just out of the reach of his proboscis. He leaned against his wooden bar, put out his trunk, and could just touch the potato, but could not pick it up. After several ineffectual efforts, he at last blew the potato against the opposite wall with sufficient force to make it rebound, and he then without difficulty secured it."

PEEL AND BYRON.

Peel, the orator and statesman ("that was, or is, or is to be"), says Byron, was my form-fellow, and we were both at the top of our remove (a public school phrase). We were on good terms, but his brother was my intimate friend. There were also great hopes of Peel amongst us all, masters and scholars; and he has not disappointed them. As a scholar, he was greatly my superior; as a declaimer and actor, I was reckoned at least his equal; as a schoolboy, out of school, I was always in scrapes, and he never; and in school he always knew his lesson, and I rarely—but when I knew it, I knew it nearly as well. In general information, history, &c. &c., I think I was his superior, as well as of most boys of my standing.—*Moore's Life of Byron*.

A NEW HOLLAND WARRIOR.

Among the attacking party there was one young man, who from his appearance and dignity of demeanour was imagined a chief or leader. Yet this impression was given by something distinct from either height of stature or personal beauty; for the New

Hollander was neither so tall nor well made as some of the others, but "a brisk young man," active and courageous. He was the only one of the group that was painted. A circle drawn by some sort of white pigment surrounded each of his eyes, and a white streak reached from the forehead to the tip of the nose. His breast and part of his arms were also stained, "not for beauty or ornament," it was very rationally concluded, "but that he seemed thereby to design the looking more terrible, his painting adding very much to his natural deformity."—*Lives and Voyages of Drake, Cavendish, &c.*

NAVIGATION OF THE MISSISSIPPI.

The first steam-vessel which sailed on this mighty stream was in 1810, and the enterprise was considered extraordinary. In 1826, the steam navigation of the Mississippi had so improved in respect to facility and quickness, that fifty-one boats, of 28,916 tons, were employed. Since 1826, the amount has been prodigiously increased, and the number of flat-boats and keels is beyond calculation.

GENERAL WASHINGTON.

In the *Memoirs of Thomas Jefferson*, late President of the United States, recently published, we are presented with the following estimate of the character of General Washington:—"His mind was great and powerful, without being of the first order; his penetration strong, though not so acute as that of a Newton, Bacon, or Locke; and, as far as he saw, no judgment was ever sounder. It was slow in operation, being little aided by invention or imagination, but sure in conclusion. Hence the common remark of his officers of the advantage he derived from councils of war, where, hearing all suggestions, he selected whatever was best; and certainly no general ever planned his battles more judiciously. He was incapable of fear, meeting personal dangers with the calmest unconcern. Perhaps the strongest feature in his character was prudence, never acting until every circumstance, every consideration, was maturely weighed; refraining, if he saw a doubt, but when once decided, going through with his purpose, whatever obstacles opposed. His integrity was most pure, his justice the most inflexible I had ever known; no motives of interest or consanguinity of friendship or hatred being able to bias his decision. He was indeed, in every sense of the words, a wise, a good, and a great man. His temper was naturally irritable and high-toned, but reflection and resolution had obtained a firm and habitual ascendancy over it. If, however, it broke its bonds, he was most tremendous in his wrath. In his expenses he was honourable, but exact; liberal in contributions to whatever promised utility, but frowning and unyielding on all visionary projects, and all unworthy calls on his charity. His heart was not warm in its affections, but he exactly calculated every man's value, and gave him a solid esteem proportioned to it. His person, you know, was fine, his stature exactly what one would wish, his deportment easy, erect, and noble; the best horseman of his age, and the most graceful figure that could be seen on horseback. Although in the circle of his friends, where he might be unreserved with safety, he took a free share in conversation; his colloquial talents were not above mediocrity, possessing neither copiousness of ideas nor fluency of words. In public, when called on for a sudden opinion, he was unready, short, and embarrassed. Yet he wrote readily, rather diffusely, in an easy and correct style. This he had acquired by conversation with the world, for his education was merely reading, writing, and common arithmetic, to which he added surveying at a later day. His time was employed in action chiefly, reading little, and that only in agriculture and English history. His correspondence became necessarily extensive, and, with journalising his agricultural proceedings, occupied most of his leisure hours within doors."

THE DISSIPATED HUSBAND.

He comes not; I have watch'd the moon go down;
But yet he comes not. Once it was not so.
He thinks not how these bitter tears do flow,
The while he holds his riot in that town.
Yet he will come, and chide, and I shall weep,
And he will wake my infant from its sleep,
To blend its feeble wailing with my tears.
Oh! how I love a mother's watch to keep
Over those sleeping eyes, that smile which cheers
My heart, though sunk in sorrow, fixed and deep.
I had a husband once who loved me; now
He ever wears a frown upon his brow,
And feeds his passion on a wanton's lip,
As bees from laurel-flowers a poison sip.
But yet I cannot hate. Oh! there were hours
When I could hang for ever on his eye;
And Time, who stole with silent swiftness by,
Strew'd, as he hurried on, his path with flowers.
I loved him then; he loved me too; my heart
Still finds its fondness kindle if he smile;
The memory of our loves will ne'er depart;
And though he often stings me with a dart,
Venom'd and barb'd, and wastes upon the vile,
Caresses which his babe and mine should share;
Though he should spurn me, I will calmly bear
His madness; and should sickness come and lay
Its paralysing hand upon him, then
I would with kindness all my wrongs repay,
Until the penitent should weep, and say,
How injured and how faithful I had been.

COLUMN FOR YOUNG LADIES.

Of the various means by which a young lady may show her taste and even her mental qualifications, so as to attract and probably fix the affections, none come so prominently into notice as an attention to the toilet, or mode of dressing. In the formation and disposition of female attire, there is an endless variety in style, much less governed by fixed rules than that which prescribes the fashions of men; and though always affected by the prevailing taste of the age, yet so indefinite as to leave to each individual great room for the exercise of her ingenuity and judgment as regards her own figure and appearance. It is one of the prevailing errors of the present, and perhaps of the past times, among ladies, to adhere scrupulously to fashion, without consulting whether such may be thus advantageous in their own particular case. I would have all my fair young countrywomen to avoid this blunder in the delicate and important affairs of the toilet. In all cases, they should, if possible, think for themselves on this subject, or be advised by others around them of more matured judgment, always settling upon at last that mode of dressing in which their good taste tells them they are most becoming. As I do not pretend to set up for a regular adviser on the subject of a young lady's toilet, I shall content myself with extracting and condensing an article for the purpose, from an exceedingly beautiful new publication, entitled "The Young Lady's Book."

"Although the toilet," says the author of the work, "should never be suffered to engross so much of the attention as to interfere with the higher duties of life, yet, as a young lady's dress, however simple, is considered a criterion of her taste, it is certainly worthy her attention. Her chief object in this respect should be, to acquire sufficient skill and good taste to do all that is needful with regard to the attire in the least possible period of time, to abbreviate the labours of the toilet, so as not to trench upon hours which should be devoted to the useful avocations of life, or the embellishments of the mind. It will be a laudable ambition in her to curb those excesses of 'each revolving mode' with which she is in some measure forced to comply; to aim at grace and delicacy rather than richness of dress; to sacrifice exuberance of ornament (which is never becoming to the young) whenever it is possible, to an admirable neatness, equally distant from the prim and the negligent; to learn the valuable art of imparting a charm to the most simple article of dress, by its proper adjustment to the person, and by its harmonious blending, or agreeably contrasting with the other portions of the attire. [This is doubtless one of the most important of the whole of the rules of the toilet.] It is a truth which ever should be borne in mind, that a higher order of taste is thus displayed, and a better effect produced, by a total absence of ornament, than by the most profuse and splendid decorations."

Fashion demands a discreet but not a servile observance; much judgment may be shown in the time, as well as in the mode chosen, for complying with her caprices. It is injudicious to adopt every new style immediately it appears; for many novelties in dress prove unsuccessful, being abandoned even before the first faint impression they produce be worn off; and a lady can scarcely look much more absurd than in a departed fashion, which, even during its brief existence, never attained a moderate share of popularity. The wearer must therefore at once relinquish the dress, or submit to the unpleasant result we have mentioned; so that, on the score of economy, as well as good taste, it is advisable not to be too eager in following the modes which whim or ingenuity created in such constant succession. On the other hand, it is unwise to linger so long as to suffer 'fashion's ever-varying flower' to bud, blossom, and nearly 'waste its sweetness' before we gather and wear it: many persons are guilty of this error: they cautiously abstain from a too early adoption of novelty, and fall into the opposite fault of becoming its proselytes at the eleventh hour: they actually disburse as much in dress as those who keep pace with the march of mode, and are always some months behind those who are about them—affording in autumn a post-obit reminiscence to their acquaintance of the fashions which were popular in the preceding spring. Such persons labour under the further disadvantage of falling into each succeeding mode when time and circumstances have deprived and degraded it from its high and palmy state; they do not copy it in its original purity, but with all the deteriorating additions which are heaped upon it subsequently to its invention. However beautiful it may be, a fashion rarely exists in its pristine state of excellence long after it has become popular: its aberrations from the perfect are exaggerated at each remove; and if its form be in some measure preserved, it is displayed in unsuitable colours, or translated into inferior materials, until the original design becomes so vulgarised as to disgust.

There are many persons who, while they affect to despise fashion, and are ostensibly the most bitter enemies of 'the goddess with the rainbow zone,' are always making secret compacts and compositions with her. Their constant aim is to achieve the effect of every new style of dress, without betraying the most distant imitation of it: they pilfer the ideas of the *modeste*, which they use (to adopt the happy expres-

sion of Sir Fretful) 'as gipsies do stolen children—disfigure them to make them pass for their own.'"
To be continued.

INDIAN SLIPPERS.

A very entertaining work on the manners of the Mussulmans of India has recently appeared, written by Mrs Meer Hassan Ali, an English lady who married a Hindostanee Mahometan, and who has had thus many opportunities of acquiring a knowledge of the strange peculiarities of the people of the East, especially of the ladies, their fashions, and mode of life. The following extract will give my fair readers an idea of the style of Mrs Meer Hassan Ali, and the nature of her descriptions:—

"The ladies never wear stockings, and only cover the feet with shoes when pacing across their courtyard, which bounds their view and their walks. Nevertheless, there is a fashion and taste about the ladies' shoes, which is productive of much emulation in zeenahnah life; they are splendidly worked in many patterns, with gold and silver spangles, variously coloured small seed beads, and embroidery—the whole one mass of glittering metal; they are made with sharp points curling upwards, some nearly reaching half way to the knees, and always worn down at the heel, as dressing slippers; the least costly for their every-day wear are of gold embroidery on velvet; the less opulent condescend to wear tinsel work; and the meanest servants yellow or red cloth with silver binding. The same style of shoes are worn by the males as by the females: I have seen some young men with green shagreen slippers for the rainy season; these are made with a high heel, and look unseemly."

SPANISH COMBS.

"Throughout Spain, but especially in Madrid, the comb is an indispensable and important part of every woman's dress. A fashionable Spanish comb is not less than a foot long, and eight or nine inches broad; and no woman considers from nine to fifteen dollars (from L. 1 to L. 3) too much to give for this appendage; accordingly, every tenth shop, at least, is a comb shop."
—*Inglish's Spain.*

THE BURYING BEETLE.

A foreign naturalist gives a very interesting account of the industry of this insect. He had often remarked, that dead moles, when laid upon the ground, especially if upon loose earth, were almost sure to disappear in the course of two or three days, often of twelve hours. To ascertain the cause, he placed a mole upon one of the beds in his garden. It had vanished by the third morning; and on digging where it had been laid, he found it buried to the depth of three inches, and under it four beetles, which seemed to have been the agents in this singular inhumation. Not perceiving any thing particular in the mole, he buried it again; and on examining it at the end of six days, he found it swarming with maggots, apparently the issue of the beetles, which M. Gleditsch now naturally concluded had buried the carcase for the food of their future young. To determine these points more clearly, he put four of these insects into a glass vessel, half filled with earth and properly secured, and, upon the surface of the earth, two frogs. In less than twelve hours one of the frogs was interred by two of the beetles; the other two ran about the whole day, as if busied in measuring the dimensions of the remaining corpse, which on the third day was also found buried. He then introduced a dead linnet. A pair of the beetles were soon engaged upon the bird. They began their operations by pushing out the earth from under the body, so as to form a cavity for its reception; and it was curious to see the efforts which the beetles made, by dragging at the feathers of the bird from below, to pull it into its grave. The male having driven the female away, continued the work alone for five hours. He lifted up the bird, changed its place, turned it and arranged it in the grave, and from time to time came out of the hole, mounted upon it, and trod it under foot, and then retired below, and pulled it down. At length, apparently wearied with this uninterrupted labour, it came forth, and leaned its head upon the earth beside the bird, without the smallest motion, as if to rest itself, for a full hour, when it again crept under the earth. The next day, in the morning, the bird was an inch and a half under ground, and the trench remained open the whole day, the corpse seeming as if laid out upon a bier, surrounded with a rampart of mould. In the evening, it had sunk half an inch lower, and in another day the work was completed, and the bird covered. M. Gleditsch continued to add other small dead animals, which were all sooner or later buried; and the result of his experiment was, that in fifty days four beetles had interred, in the very small space of earth allotted to them, twelve carcases; viz. four frogs, three small birds, two fishes, one mole, and two grasshoppers, besides the entrails of a fish, and two morsels of the lungs of an ox. In another experiment, a single beetle buried a mole forty times its own bulk and weight in two days.

HUNGARIAN FUNERALS.

It is mentioned by Bright, in his Travels in Lower Hungary, that the peasantry, and people generally, are remarkable for the indulgence of the deepest and most lasting expressions of melancholy on the death of relatives and friends. "While pursuing my journey in one of the roads of the country," says the traveller, "my attention was drawn to a cottage on the

opposite side of the way, at which preparations were made for a funeral. The deceased was a child, and the coffin, covered with a muslin drapery, and adorned with bows of pink riband, was placed before the cottage door; a glass of holy water stood apart, in which a brush was immersed; and as a crowd of women and children, with a few men, collected around, each sprinkled water from the brush upon the coffin, and many placed themselves in attitudes of prayer. Soon after, the priest and clerk arrived, when the latter sang several hymns. The priest then moved slowly on; and a young woman neatly dressed, with a long plait of hair hanging down her back, adorned with blue and red ribands, gently raised the coffin on her head and followed. The rest of the party formed themselves in procession, and repaired to the place of interment."

BAYONET.

The side-arms used by infantry, and called bayonets, are thus denominated, because they were first made at Bayonne, in France.

JERUSALEM.

From Carne's general description of Jerusalem, which is among the best I have seen, I extract the following passage:—"It is difficult to find a place that contains so many inhabitants and dwellings within so small a compass as Jerusalem; they seem to cling with tenacity, and with some of their ancient fondness, to the very brink of the declivities on every side. Certainly, as in former times, the utmost use is made of every inch of ground; and nature has been very niggard in this respect. Ascending from the labyrinth of narrow streets, up a gentle acclivity, we found that the summit commanded a singular view of the interior of the city, amidst which appeared more ruinous and desolate spots than could previously have been imagined. Directly in front was a large reservoir of water, supplied from the ancient cisterns, several miles distant. Steps led down the sides of this reservoir to the water, which forms now, as it did in past times, a chief resource of the surrounding inhabitants during the dry weather, and was no doubt one of those pools so frequently alluded to in Scripture. It was thickly enclosed by dwellings on every side, and shut out from view, except from the immediate vicinity, and was evidently hewn out of the rock. The flat terraced roofs of the city, the domes and minarets of the mosques, blended with the cupolas of the churches, came into view from this ruinous eminence, where the stranger might well sit for hours and muse on the strange and various picture at his feet. There, to the east, stood the palace of Herod, amidst its gardens and palm-trees, the home of the beautiful Mariamne, close to the forsaken spot, where is now a mosque, and that mosque is now built on the ruins of a Christian church. To the left, on the site of the tall and strong tower built by the Crusaders, and now garrisoned by the Turks, stood the palace of the king of Israel. Each solitary place around was once trodden or dwelt in by a prince or a prophet, and alike echoed to the splendid prophecies of future glory or the warnings of unutterable woe."

GAS.

The mode of adapting it to lighting our streets and houses was discovered by a Frenchman, an engineer, named Lebon, about twenty-five years ago, who gives the following particulars of the circumstances which first led to its application. It was about 1663, that Becher, a skilful chemist, discovered that coal, when calcined in close vessels, yielded a kind of oil, resembling tar, and capable of serving for the same uses. Experiments made in 1758, in Alsace, for the extraction of this oil, proved that the calcined coal left in the retort was of excellent quality for melting iron, and for all domestic purposes. In 1768, M. de Limbourg, having employed the same processes at the forges of Theuse, in the principality of Liege, substituted for earthen retorts, which till then had been made use of, retorts of cast iron, which are more durable, and in which an opening may be made, provided with a door, for putting in and taking out the coal. These experiments were repeated with success in England and France. In the prosecution of them, it was found that, besides the solid and liquid products, there was disengaged an inflammable gas, composed of carbon and hydrogen, and which was therefore denominated *carburetted hydrogen*. In 1799, Lebon conceived an idea of adapting this carburetted hydrogen gas to a useful purpose, and realised it the same year at Paris, by exhibiting the interior of his house and garden illuminated with it, issuing from a large reservoir, where it underwent a slight compression, and was conducted to the lamps by small tubes furnished with cocks, that could be opened at pleasure to light the gas, or closed to extinguish it. Lebon set up one of these apparatus, which he called thermo lamps, at the Theatre de Loerovis, where every body had an opportunity of seeing it for several months. It was the very same apparatus now employed in England, but on a much larger scale. The only difference is, that Lebon obtained his gas by the calcination of wood, and the English from coal.

No. 8.

SATURDAY, MARCH 24, 1832.

PRICE THREE HALFPENCE.

A TALE OF THE PLAGUE IN EDINBURGH. In several parts of Scotland such things are to be found as *tales* of the plague. Amidst so much human suffering as the events of a pestilence necessarily involved, it is of course to be supposed that occasionally circumstances would occur of a peculiarly disastrous and affecting description—that many loving hearts would be torn asunder, or laid side by side in the grave—many orphans left desolate, and patriarchs bereft of all their descendants—and that cases of so painful a sort as called forth greater compassion at the time, would be remembered, after much of the ordinary details was generally forgotten. The celebrated story of Bessy Bell and Mary Gray is a case in point. So romantic, so mournful a tale, appealing as it does to every bosom, could not fail to be commemorated, even though it had been destitute of the great charm of locality. In the course of our researches, we have likewise picked up a few extraordinary circumstances connected with the last visit paid by the plague to Edinburgh, which, improbable as they may perhaps appear, we believe to be, to a certain extent, allied to truth, and shall now submit them to our readers.

When Edinburgh was afflicted, for the last time, with the pestilence, such was its effect upon the energies of the citizens, and so long was its continuance, that the grass grew on the principal street, and even at the Cross, though that *Scottish Rialto* was then perhaps the most crowded thoroughfare in Britain. Silence, more than that of the stillest midnight, pervaded the streets during the day. The sunlight fell upon the quiet houses as it falls on a line of sombre and neglected tombstones in some sequestered churchyard—gilding, but not altering their desolate features. The area of the High Street, on being entered by a stranger, might have been contemplated with feelings similar to those with which Christian, in the Pilgrim's Progress, viewed the awful courtyard of Giant Despair; for in that well-imagined scene, the very ground bore the marks of wildness and desolation; every window around, like the loopholes of the dungeons in Doubting Castle, seemed to tell its tale of misery within; and the whole seemed to lie prostrate and powerless under the dominion of an unseen demon, which fancy might have conceived as stalking around in a bodiless form, leisurely dooming its subjects to successive execution.

When the pestilence was at its greatest height, a strange perplexity began, and not without reason, to take possession of the few physicians and nurses who attended the sick. It was customary for the distempered to die, or, as the rare case happened, to recover, on a particular day after having first exhibited symptoms of illness. This was an understood rule of the plague, which had never been known to fail. All at once it began to appear that a good many people, especially those who were left alone in their houses by the death or desertion of friends, died before the arrival of the critical day. In some of these cases, not only was the rule of the disease broken, but what vexed the physicians more, the powers of medicine seemed to have been set at defiance; for several patients of distinction, who had been able to purchase good attendance, and were therefore considered as in less than ordinary danger, were found to have expired after taking salutary drugs, and being left with good hopes by their physicians. It almost seemed as if some new disease were beginning to engraft itself upon the pestilence—a new feature rising upon its horrid aspect. Subtle and fatal as it formerly was, it was now inconceivably more so. It could formerly be calculated upon; but it was now quite arbitrary and precarious. Medicine had lost its power over it. God, who

created it in its first monstrous form, appeared to have endowed it with an additional sting, against which feeble mortality could present no competent shield. Physicians beheld its new ravages with surprise and despair; and a deeper shade of horror was spread in consequence over the public mind.

As an air of more than natural mystery seemed to accompany this truly calamitous turn of affairs, it was of course to be expected, in that superstitious age, that many would attribute it to a more than natural cause. By the ministers, it was taken for an additional manifestation of God's wrath, and as such held forth in not a few pulpits, accompanied with all the due exhortations to a better life, which it was not unlikely would be attended with good effect among the thin congregations of haggard and terrified scarecrows, who persisted in meeting regularly at places of worship. The learned puzzled themselves with conjectures as to its probable causes and cures; while the common people gave way to the most wild and fanciful surmises, almost all of which were as far from the truth. The only popular observation worthy of any attention, was, that the greater part of those who suffered from this new disease died during the night, and all of them while unattended.

Not many days after the alarm first arose, a poor woman arrested a physician in the street, and desired to confer with him a brief space. He at first shook her off, saying he was at present completely engaged, and could take no new patients. But when she informed him that she did not desire his attendance, and only wished to communicate something which might help to clear up the mystery of the late premature deaths, he stopped, and lent a patient ear. She told him, that, on the previous night, having occasion to leave her house, in order to visit a sick neighbour who lay upon a lonely deathbed in the second flat below her own garret, she took a lamp in her hand, that she might the better find her way down. As she descended the stair, which she described as a *turnpike*, or spiral one, she heard a low and inexpressibly doleful moan, as if proceeding from the house of her neighbour—such a moan, she said, as she had never heard proceed from any of the numerous deathbeds it had been her lot to attend. She hastened faster down the stair than her limbs were able to carry her, under the idea that her friend was undergoing some severe suffering, which she might be able to alleviate. Before, however, she had reached the first landing-place, a noise, as of footsteps, arose from the house of pain, and caused her to apprehend that all was not right in a house which she knew no one ever visited in that time of desolation but herself. She quickened her pace still more than before, and soon reached the landing-place at her neighbour's door. Something, as she expressed it, seeming to *swoof* down the stairs, like the noise of a full garment brushing the walls of a narrow passage, she drew in the lamp, and, looking down beyond it, saw what she conceived to be the dark drapery of the back of a tall human figure, loosely clad, moving, or rather gliding, out of sight, and in a moment gone. So uncertain was she at first of the reality of what she saw, that she believed it to be the shadow of the central pile of the stair gliding downwards as she brought round the light; but the state of matters in the inside of the house soon convinced her, to her horror, that it must have been something more dreadful and real—the unfortunate woman being dead; though as yet it was three days till the time when, according to the old rules of the disease, she might have lived or died. The physician heard this story with astonishment; but as it only informed his mind, which was not free from superstition, that the whole matter was becom-

ing more and more mysterious, he drew no conclusions from it, but, simply observing, with a professional shake of the head, that all was not right in the town, went upon his way.

The old woman, who of course could not be expected to let so good a subject of gossip and wonderment lie idle in her mind, like the guinea kept by the Vicar of Wakefield's daughters, forthwith proceeded to dissipate it abroad among her neighbours, who soon (to follow out the idea of the coin) reduced it into still larger and coarser pieces, and paid it away, in that exaggerated form, to a wider circle of neighbours, by whom it was speedily dispersed in various shapes over the whole town. The popular mind, like the ear of a sick man, being then peculiarly sensitive, received the intelligence with a degree of alarm, such as the news of a lost battle has not always occasioned amongst the people; and as the atmosphere is best calculated for the conveyance of sound during the time of frost, so did the air of the plague seem peculiarly well fitted for the propagation of this fearful report. The whole of the people were impressed, on hearing the story, with a feeling of undefined awe, mixed with horror. The back of a tall figure, in dark long clothes, seen but for a moment! There was a picturesque indistinctness in the description, which left room for the imagination; taken in conjunction, too, with the moan heard at first by the old woman on the stair, and the demise of the sick woman at the very time, it was truly startling. To add to the panic, a report arose next day, that the figure had been seen on the preceding evening, by different persons, fitting about various stairs and alleys, always in the shade, and disappearing immediately after being first perceived. An idea began to prevail that it was the image of Death—Death, who had thus come, in his impersonated form, to a city which seemed to have been placed so peculiarly under his dominion, in order to execute his office with the greater promptitude. It was thought—if so fantastic a dream may be assigned to the thinking faculty—that the grand destroyer, who in ordinary times is invisible, might perhaps have the power of rendering himself palpable to the sight in cases where he approached his victims, under circumstances of peculiar horror; and this wild imagination was the more fearful, inasmuch as it was supposed that, with the increase of the mortality, he would become more and more distinctly visible, till, perhaps, after having dispatched all, he would burst forth in open triumph, and roam at large throughout a city of desolation.

It happened, on the second day after the rise of this popular fancy, that an armed ship, of a very singular construction, and manned by a crew of strangely foreign-looking men, entered Leith harbour. It was a Barbary rover; but the crew showed no intention of hostility to the town of Leith, though at the present pass it would have fallen an easy prey to their arms, being quite as much afflicted with the pestilence as its metropolitan neighbour. A detachment of the crew, comprising one who appeared to be the commander, immediately landed, and proceeded to Edinburgh, which they did not scruple to enter. They inquired for the provost, and, on being conducted to the presence of that dignitary, their chief disclosed their purpose in thus visiting Edinburgh, which was the useful one of supplying it in its present distress with a cargo of drugs, approved in the East for their efficacy against the plague, and a few men who could undertake to administer them properly to the sick. The provost heard this intelligence with overflowing eyes; for, besides the anxiety he felt about the welfare of the city, he was especially interested in the health of

his daughter, an only child, who happened to be involved in the common calamity. The terms proposed by the Africans were somewhat exorbitant: they demanded to have half of the wealth of those whom they restored to health. But the provost told them that he believed many of the most wealthy citizens would be glad to employ them on these terms; and, for his own part, he was willing to sacrifice any thing he had, short of his salvation, for the benefit of his daughter. Assured of at least the safety of their persons and goods, the strangers drew from their ship a large quantity of medicines, and began that very evening to attend, as physicians, those who chose to call them in. The captain—a man in the prime of life, and remarkable amongst the rest for his superior dress and bearing—engaged himself to attend the provost's daughter, who had now nearly reached the crisis of the distemper, and hitherto had not been expected to survive.

The house of Sir John Smith, the provost of Edinburgh, in the year 1645, was situated in Cap and Feather Close, an alley occupying the site of the present North Bridge. The bottom of this alley being closed, there was no thoroughfare or egress towards the North Loch; but the provost's house possessed this convenience, being the tenement which closed the lower extremity, and having a back-door that opened upon an alley to the eastward, namely, Halkerston's Wynd.* This house was, at the time we speak of, crammed full of valuable goods, plate, &c., which had been deposited in the provost's hands by many of his afflicted fellow-citizens, under the impression that, if they survived, he was honest enough to restore them unimpaired, and, if otherwise, he was worthy to inherit them. His daughter, who had been seized before it was found possible to remove her from the town, lay in a little room at the back of the house, which, besides one door opening from the large staircase in the front, had also a more private entry communicating with the narrower and obsolete turnpike behind. At that time, little precaution was taken any where in Scotland about the locking of doors. To have the door simply closed, so that the fairies could not enter, was in general considered sufficient, as it is at the present day in many remote parts. In Edinburgh, during the time of the plague, the greatest indifference to security of this sort prevailed. In general, the doors were left unlocked from within, in order to admit the cleansers, or any charitable neighbour who might come to minister to the bed-ridden sick. This was not exactly the case in Sir John Smith's house; for the main door was scrupulously locked, with a view to the safety of the goods committed to his charge. Nevertheless, from neglect, or from want of apprehension, the posterior entrance was afterwards found to have been not so well secured.

The Barbary physician had administered a potion to his patient soon after his admission into the house. He knew that symptoms either favourable or unfavourable would speedily appear, and he therefore resolved to remain in the room in order to watch the result. About midnight, as he sat in a remote corner of the room, looking towards the bed upon which his charge was extended, while a small lamp burned upon a low table between, he was suddenly surprised to observe something like a dark cloud, unaccompanied by any noise, interpose itself slowly and gradually between his eyes and the bed. He at first thought that he was deceived—that he was beginning to fall asleep—or that the strange appearance was occasioned by some peculiarity of the light, which, being placed almost directly between him and the bed, caused him to see the latter object very indistinctly. He was soon undeceived by hearing a noise—the slightest possible—and perceiving something like motion in the ill-defined lineaments of the apparition. Gracious heaven! thought he, can this be the angel of death hovering over his victim, preparing to strike the mortal blow, and ready to receive the departing soul into the inconceivable recesses of its awful form? It almost appeared as if the cloud stooped over the bed for the performance of this task. Presently, the patient uttered a half-suppressed sigh, and then altogether ceased the regular respirations, which had hitherto been monotonous and audible throughout the room. The awe-struck attendant could contain himself no longer, but permitted a sort of cry to escape him, and started to his feet. The cloud instantly, as it were, rose from its inclined posture over the bed, turned hastily round, and, in a moment contracting itself into a human shape, glided softly but hastily from the apartment. Ha! thought the African, I have known such personages as this in Aleppo. These angels of death are sometimes found to be mortals themselves—I shall pursue and try. He therefore quickly followed the phantom through the private door by which it had escaped, not forgetting to seize his semicircular sword in passing the table where it lay. The stair was dark and steep, but he kept his feet till he reached the bottom. Casting, then, a hasty glance around him, he perceived a shadow vanish from the moon-lit ground, at an angle of the house, and instantly started forward in the pursuit. He soon found himself in the open wynd above mentioned, along which he sup-

posed the mysterious object to have gone. All here was dark; but being certain of the course adopted by the pursued party, he did not hesitate a moment in plunging headlong down its steep profundity. He was confirmed in his purpose by immediately afterwards observing, at some distance in advance, a small jet of moonlight, proceeding from a side alley, obscured for a second by what he conceived to be the transit of a large dark object. This he soon also reached, and finding that his own person caused a similar obscurity, he was confirmed in his conjecture that the apparition bore a substantial form. Still forward and downward he boldly rushed, till, reaching an open area at the bottom, part of which was lighted by the moon, he plainly saw, at the distance of about thirty yards in advance of him, the figure as of a tall man, loosely enveloped in a prodigious cloak, gliding along the ground, and apparently making for a small bridge, which at this particular place crossed the drain of the North Loch, and served as a communication with the village called Mutrie's Hill. He made directly for the fugitive, thinking to overtake him almost before he could reach the bridge. But what was his surprise, when, in a moment, the flying object vanished from his sight, as if it had sunk into the ground, and left him alone and objectless in his headlong pursuit. It was possible that it had fallen into some concealed well or pit, but this he was never able to discover. Bewildered and confused, he at length returned to the provost's house, and re-entered the apartment of the sick maiden. To his delight and astonishment he found her already in a state of visible convalescence, with a gradually deepening glow of health diffusing itself over her cheek. Whether his courage and fidelity had been the means of scaring away the evil demon, it is impossible to say; but certain it is, that the ravages of the plague began soon afterwards to decline in Edinburgh, and at length died away altogether.

The conclusion of this singular traditionary story bears, that the provost's daughter, being completely restored to health, was married to the foreigner who had saved her life. This seems to have been the result of an affection which they had conceived for each other during the period of her convalescence. The African, becoming joint-heir with his wife of the provost's vast property, abandoned his former piratical life; became, it is said, a dounce Presbyterian, and settled down for the remainder of his days in Edinburgh. The match turned out exceedingly well; and it is even said that the foreigner became so assimilated with the people of Edinburgh, to whom he had proved so memorable a benefactor, that he held at one time an office of considerable civic dignity and importance. Certain it is, that he built for his residence a magnificent land near the head of the Canongate, upon the front of which he caused to be erected a statue of the emperor of Barbary, in testimony of the respect he still cherished for his native country; and this memorial yet remains in its original niche, as a subsidiary proof of the verity of the above relation.

FORMATION OF SCOTTISH SOCIETY.

Continued.

THE first of the distinguished family alluded to at the end of the preceding article was Robert Avenel, who under David I. settled in Upper Eskdale. He flourished during the reigns of Malcolm IV. and William, whose charters he witnessed. By thus noticing the signatures as witnesses to the old charters, much is learned of the old Scottish families. Robert Avenel officiated as Justiciary of Lothian for a short period after the accession of William, in 1165. It appears that this Anglo-Saxon baron retired from the turmoils of life into the monastery of Melrose, where he died in 1185, leaving a son to inherit his honours. The Avenels, for several generations, continued among the most powerful families on the Borders; a circumstance which has doubtless suggested to Sir Walter Scott the idea of commemorating them in the tales of "The Monastery" and "The Abbot." It may also be noticed, that a particular intimacy subsisted between the Avenels and the monks of St Mary's, and it is seen that they were individually buried in the isles of the abbey. Yet amidst this friendship, which the Author of Waverley has so well interwoven with his romance, it is observed, from the family history, that they occasionally had quarrels with the monks relative to their property. In 1135, Gervase Avenel had a serious dispute with them regarding the game on the lands endowed to the use of the monastery, by one of his predecessors. The king at length interfered to quell the disturbance, and "found that the monks were entitled to the soil, but not to the game, which belonged to the Avenels, as lords of the manor." The distinguished family of Avenel merged, like many others, in a female heir, who married Henry, the son of Henry de Graham of Abercorn and Dalkeith, and thereby carried the estates of the Avenels into a family in the Lothians.

We now come to the family of Olifard, or Oliphant. The first of this name was David de Olifard, who, it is said, accompanied David I. in the retreat from Winchester in 1124. David certainly gave the companion of his journey the manors of Smalholm and Crailing, in Roxburghshire. He also enjoyed, for some time, the Justiciarship of Lothian. The Olifards spread into Kincardineshire, Perthshire, and Lanarkshire, in the twelfth and thirteenth centuries. The main line

was elevated to the peerage by James II.; it afterwards merged in a female heir, who, marrying Hugh de Abernethy, founded the noble house of the Viscounts Arbuthnot.

The Giffords were of as noble and ancient a stock, having been relatives of the Norman Conqueror. Two of the race came to Scotland under David I.; and one of these, Hugh Gifford, settling in East Lothian, conveyed his name to a village and parochial division. From this great stem there branched out several families of the name, who also rose to eminence. The Sæys were a family who derived their descent from the same Norman original. The first of the race who came into Scotland was Seiker de Sey, who obtained lands from David I. in East Lothian, and laid the foundation of the noble family of *Saton*, or *Seton*, earls of Winton, which distinguished itself through six centuries of Scottish history, and was attained in 1715. The first of the noble house of *Keith* was a person called Hervei, who attached himself to David, and acquired the estate of Keith in East Lothian, from whence the surname of the family was assumed. One of his descendants in the third generation took the surname of Marischall, from the family possessing the dignity of Knight Marischall of Scotland; and hence the name *Marshall* originated. Before the middle of the twelfth century, a person of Anglo-Norman lineage, named *Male*, settled under David I. on some lands in Mid-Lothian, conferring on his seat the title of *Maleville*, from which appellation the *Melvilles* took their surname. The main line of the Males, in the reign of Robert II. (1371-90), ended in a female heir, Agnes, who married Sir John Ross of Halkhead. The descendant of this marriage acquired the peerage of Lord Ross in 1700. The estate was purchased during last century by David Rennie, whose daughter carried it by marriage to Henry Dundas, created Viscount Melville in 1802. It is generally understood that the *Maules* were of the same lineage as the *Males*. The first of the name in Scotland was Robert Maule, who attached himself to David I., and acquired lands in Mid-Lothian; one of his sons became the progenitor of the *Maules of Panmure*. The *Berkeleys* settled in Scotland in the twelfth century, and were a branch of the great Berkeley family in Gloucestershire. The family has greatly branched out under the surname of *Barclay*. The *Montealts* were another English family which settled in Scotland under David. Their name, which they took from a place in Flintshire, has been softened into *Mowat*. At the same period the *De Lundins* settled in Fife and Forfarshire, and originated families with the appellation of *Lundie*. The family called *Harris* or *Herries* settled in the country also during the reign of David. The first of the race, who was of Anglo-Norman lineage, was named *Heriz*; the family acquired a settlement in Dumfriesshire and Galloway. The noble family of Cunningham, in Ayrshire, traces its (correct) origin from Warnebal, a person who came from the north of England, and settled as a vassal under Hugh Morville, in Cunningham. From him he obtained the manor of Cunningham, which comprehended most of the parish of Kilmaurs, and from this manor the family surname was assumed. The progenitors of the *Lockharts* were Stephen Lockhard and Simon Lockhard, who settled in Lanarkshire and Ayrshire during the twelfth century. Simon, who was the progenitor of the Lockharts of Lee, gave the name of *Symington* to a parish in Clydesdale; and Stephen, in the same manner, conferred the name of *Stevenson* on a parish in the district of Cunningham.

The origin of the distinguished family of *Hay* has been strangely obscured by the fabulous legends of the genealogists. Without impugning the story of the battle of Luncarty, and the feat performed with the oxen yoke, it is an ascertained fact, worthy of belief, that the first person of the name of Hay in Scotland, of whom record preserves any notice, was William de Hay, the descendant of an Anglo-Norman who settled in Lothian at the middle of the twelfth century, and founded the family of the Hays of Lockerwart (Borthwick), Lords of Yester, and Earls and Marquises of Tweeddale, as also the Hays of Spot, Smithfield, Hayston, &c. The second William de Hay received a grant of the lands of Errol, in the Carse of Gowrie, from King William (1165—1214); the Hays thus branching off into two main lines.

The *Ramsays* were likewise settlers of the twelfth century, bringing with them the name from England, where it was a local appellation. The first of the race in North Britain was Simon de Ramsay, who received lands in Mid-Lothian under David I., and founded the noble family of the Ramsays of Dalhousie, from whence all the other Ramsays throughout Scotland are undoubtedly sprung. The *Falconers*, another old Scottish family, are of the same English extraction. Walter, the first of the family, received lands in the Mearns from David I.; and his son Ralph, being appointed *Falconer* by William the Lion, and called by him *Falconarius noster*, his descendants acquired the surname of *Falconer*, which they still retain. The *Rolls* may next be brought under notice.—To be continued.

REPUBLICAN HEROISM.

At the siege of Crema, 1160, four hundred Milanese had thrown themselves into the town, to partake the combats and dangers of their allies. The emperor, who regarded the besieged only as revolted subjects, sought to terrify them by the spectacle of punishments. Hostages had been sent to him by Milan and

* This miserable place possesses an interest of which the most of our readers cannot be aware. It receives its name from the circumstance of a brave young man, by name David Halkerston, the brother of the ancestor of the celebrated Halkerston of Rathillet, having been killed in it in 1544, when defending the town against the English under the Earl of Hertford.

Crema; he ordered several of them to be hung before the walls of the town. Some were children of the most distinguished families; he caused them to be bound to a moving tower, which was brought so close to the attack that the besieged could not repel it without killing or wounding their own children. A cry of despair resounded along the walls of Crema. The wretched parents implored death from their fellow-citizens, to escape witnessing the agony of their children, and at the same time cried out to their children not to fear giving up their lives for their country. The battle, in fact, was not interrupted; and the moving tower was repelled, after nine of the young hostages who covered it with their bodies had been killed. During six entire months did the small town of Crema resist the whole army of the emperor. Famine at length accomplished what force could not; and on the 26th of January 1160, the heroic inhabitants capitulated, abandoning their wealth to pillage, and their houses to the flames. For themselves, wasted by famine and fatigue, they obtained permission to withdraw to Milan.—*Sismondi.*

VICTIMS.

THE industrious classes of the middle rank are, on the one hand, *attracted onwards* to wealth and respectability, by contemplating men, formerly of their own order, who, having, as the saying is, feathered their nests, now lie at ease, a kind of *conscripti patres*; while they are on the other hand *repelled* from the regions of poverty and disgrace by the sight of a great many wretched persons, who, having, under the influence of some unhappy star, permitted their good resolutions of industry and honour to give way, are sunk from their former estate, and now live—if living it can be called—in a state of misery and ignominy almost too painful to be thought of. There may be a use in this—as there is a use for beacons and buoys at sea. But oh, the desolation of such a fate! As different as the condition of a vessel which ever bends its course freely and gallantly over the seas, on some joyous expedition of profit or adventure, compared with one which has been deprived of all the means of locomotion, and chained down upon some reef of rocks, merely to tell its happier companions that it is to be avoided; so different is the condition of a man still engaged in the hopeful pursuits of life, and one who has lost all its prospects.

The progress of men who live by their daily industry, through this world, may be likened to the march of an army through an enemy's country. He who, from fatigue, from disease, from inebriety, from severe wounds, or whatever cause, falls out of the line of march, and lays him down by the wayside, is sure, as a matter of course, to be destroyed by the peasantry; once let the column he belongs to pass on a little way ahead, and death is his sure portion. It is a dreadful thing to fall behind the ever-onward march of the world.

VICTIMS—the word placed at the head of this article—is a designation for those woe-begone mortals who have had the misfortune to drop out of the ranks of society. Every body must know more or less of victims, for every body must have had to pay a smaller or greater number of half-crowns in his time to keep them from starvation. It happens, however, that the present writer has had a *great deal to do with victims*; and he therefore conceives himself qualified to afford his neighbours a little information upon the subject. It is a subject not without its moral; nor, with deference to the feelings of humanity, is it without its humour.

A victim may become so from many causes. Some men are wrong placed in the world by their friends, and ruin themselves. Some are ill married, and lose heart. Others have tastes unsuited to the dull course of a man of business, as for music, social pleasures, the company of men *out of their own order*, and so forth. Other men have natural imperfections of character, and sink down, from pure inability to compete with rivals of more athletic constitution. But the grand cause of declension in life, is inability to accommodate circumstances and conduct.

Suppose a man to have broken credit with the world, and made that treaty of perpetual hostility with it, which, *quasi lucus à non lucendo*, is called a *cessio bonorum*—what is he to do next? One thing is dead clear—he no more appears on Prince's Street or the Bridges. They are to him as a native and once familiar land, from which he is exiled for ever. His migrations from one side of the town to the other are now accomplished by channels such as Leith Wynd and the Cowgate, which, however well known to our ancestors, are in the present day dreamt of by nobody, except, perhaps, the author of the *Traditions of Edinburgh*. I once came full upon a victim in Croftangry, a wretched alley near the palace of Holyrood House; he looked the genius of the place! But the ways of victims are in general very occult. Sometimes I have altogether lost sight of one for several years, and given him up for dead. But at length he would reappear at a midnight fire in the High Street, as salmon come from the deepest pools towards the lighted sheaf of the fisherman, or as some old revolutionary names that had disappeared from French history for a quarter of a century, came again above-board on the occasion of the late revolution at Paris. At that said fire in the High Street, I observed several victims, who had long vanished from the open daylight streets,

come out to glare with their bleared eyes upon the awful scene—perhaps unroosted from their dens by the progress of the “devouring element.” But—what is a victim like?

The progress of a victim's gradual deterioration depends very much upon the question, whether he has, according to the old joke, failed with a waistcoat or a full suit. Suppose the latter contingency: he keeps up a decent appearance for some months after the fatal event, perhaps even making several attempts to keep up a few of his old acquaintance. It won't do, however; “the clothes get worn—threadbare—slit—torn—patched—darned, let ink, thread, and judicious arrangement of person, do their best. The hat, the shoes, and the gloves, fail first; he then begins to wear a suspicious deal of whitey-brown linen in the way of cravat. Collars fail. Frills retire. The vest is buttoned to the uppermost button, or even, perhaps, with a supplementary pin (a pin is the most squalid object in nature or art) at top. Still, at this period, he tries to carry a jaunty, genteel air; he has not yet all forgot himself to rags. But, see, the buttons begin to show something like new moons at one side; these moons become *full*; they *change*; and then the button is only a little wisp of thread and rags, deprived of all power of retention over the button-hole. His watch has long been gone to supply the current wants of the day. The vest by and bye retires from business, and the coat is buttoned up to the chin. About this period, he perhaps appears in a pair of nankeen trousers, which, notwithstanding the coldness of the weather, he tries to sport in an easy, genteel fashion, as if it were his taste. If you meet him at this time, and inquire how he is getting on in the world, he speaks very confidently of some excellent situation he has a prospect of, which will make him better than ever; it is perhaps to superintend a large new blacking manufactory which is to be set up at Portobello, and for which two acres of stone bottles ten feet deep have already been collected from all the lumber-cellars in the country; quite a nice easy business; nothing to do but collect the orders and see them executed; good salary, free house, coal, candle, and *blacking*; save a pound a-year on the article of blacking alone. Or it is some other *concern* equally absurd, but which the disordered mind of the poor unfortunate is evidently rioting over with as much enjoyment as if it were to make him once more what he had been in his better days. At length—but not perhaps till two or three years have elapsed—he becomes that lamentable picture of wretchedness which is his ultimate destiny; a mere pile of clothes without pile—a deplorable—a *victim*.

As a picture of an individual victim, take the following:—My earliest recollections of Mr — refer to his keeping a seedshop in the New Town of Edinburgh. He was a remarkably smart active man, and could tie up little parcels of seeds with an almost magical degree of dispatch. When engaged in that duty, your eye lost sight of his fingers altogether, as you cease to individualise the spokes of a wheel when it is turned with great rapidity. He was the inventor of a curious tall engine, with a peculiar pair of scissors at top, for cutting fruit off trees. This he sent through Prince's Street every day with one of his boys, who was instructed every now and then to draw the string, so as to make the scissors close as sharply as possible. The boy would watch his men—broad-skirted men with top-boots—and, gliding in before them, would make the thing play *clip*. “Boy, boy,” the country gentleman would cry, “what's that?” The boy would explain; the gentleman would be delighted with the idea of cutting down any particular apple he chose out of a thickly laden and unapproachable tree; and, after that, nothing more was required than to give him the card of the shop. Mr —, however, was not a man of correct or temperate conduct. He used to indulge even in forenoon potations. Opposite to his shop there was a tavern, to which he was in the habit of sending a boy every day for a tumbler of spirits and water, which the wretch was carefully enjoined to carry under his apron. One day, the boy forgot the precaution, and carried the infamous crystal quite exposed in his hand across the open and crowded street. Mr — was surveying his progress both in going and returning; and when he observed him coming towards the shop with so damnable a proof of his malpractices holden forth to the gaze of the world, he leaped and danced within his shop window like a supplejack in a glass case. The poor boy came in quite innocently, little wotting of the crime he had committed, or the reception he was to meet with, when, just as he had deposited the glass upon the counter, a blow from the hand of his master stretched him insensibly in a remote corner of the shop, among a parcel of seed-bags. As no qualities will succeed in business unless perfectly good conduct be among the number, and, above all things, an abstinence from tipping, — soon became a victim. After he first took to the *dent*, to use Rob Roy's phrase, I lost sight of him for two or three years. At length I one day met him on a road a little way out of town. He wore a coat buttoned at the chin, and which, being also very long in the breast, according to a fashion which obtained about the year 1813, seemed to enclose his whole trunk from neck to groin. With the usual cataract of cravat, he wore a hat the most woe-begone, the most dejected, the most melancholy I had ever seen. His face was inflamed and agitated; and as he walked, he swung out his arms with a strange emphatic expression, as if he were say-

ing, “I am an ill-used man, but I'll tell it to the world.” Misery had evidently given him a slight craze, as it almost always does when it overtakes a man accustomed in early life to better things. Some time afterwards I saw him a little revived through the influence of a *new second-hand coat*, and he seemed, from a small leathern parcel which he bore under his arm, to be engaged in some small agency. But this was a mere flash before utter expiration. He relapsed to the Cowgate—to rags—to wretchedness—to madness—immediately after. When I next saw him, it was in that street, the time midnight. He lay in the bottom of a stair; more like a heap of mud than a man. A maniac curse, uttered as I stumbled over him, was the means of my recognising it to be —.

The system of life pursued by victims in general, is worthy of being inquired into. Victims hang much about taverns in the outskirts of the town. Perhaps a decent man from Pennycuik, with the honest rustic name of Walter Brown or James Gowns, migrates to the Candlemaker Row or the Grassmarket, and sets up a small public-house. You may know the man by his corduroy spatterdashes, and the latches of his shoes drawn through them by two pye-holes. He is an honest man, believing every body to be as honest as himself. Perhaps he has some antiquated and prescribed right to the stance of a haystack at Pennycuik, and is not without his wishes to try his fortune in the Parliament House. Well, the victims soon scent out his house by the glare of his new sign—the *novitas regni*—and upon him they fall tooth and nail. Partly through simplicity, partly by having his feelings excited regarding the stance of the haystack, he gives these gentlemen some credit. For a while you may observe a flocking of victims towards his doorway, like the gathering of clean and unclean things to Noah's ark. But it is not altogether a case of deception. Victims, somehow or other, occasionally *have* money. True, it is seldom in greater sums than sixpence. But then consider the importance of sixpence to a flock of victims. Such a sum, judiciously managed, may get the whole set meat and drink for a day. At length, when Walter begins to find his barrels run dry, with little return of money wherewithal to replenish them, and when the joint influence of occasional apparitions of sixpence, and the stance of the haystack at Pennycuik, has no longer any effect upon him, why, what is to be done but fly to some other individual, equally able and willing to bleed?

One thing is always very remarkable in victims, namely, their extraordinary frankness and politeness. A victim might have been an absolute bear in his better days; but hunger, it is said, will tame a lion; and it seems to have the same effect in subduing the asperities of a victim. Meet a victim where you will—that is, before he has become altogether deplorable—and you are amazed at the bland, confidential air which he has assumed, so different, perhaps, from what he sported in better days. His manner, in fact, is most insinuating—into your pocket; and if you do not get alarmed at the symptoms, and break off in time, you are brought down for half a crown as sure as you live. Victims keep up a kind of constant *civil* war with shops. They mark those which have been recently opened, and where they see only young men behind the counter. They try to establish a kind of credit of face, by now and then dropping in and asking, in a genteel manner, for a sight of a Directory, or for a bit of twine, or for “the *least* slip of paper,” occasionally even spending a halfpenny or a penny in a candid, honourable way, and with the air of a person wishing to befriend the shop. In the course of these “transactions,” they endeavour to excite a little conversation, beginning with the weather, gradually expanding to a remark upon the state of business, and, perhaps, ending with a sympathising inquiry as to the prospects which the worthy shopkeeper himself may have of succeeding in his present situation. At length, having laid down what painters call a *priming*, they come in some day, in a hurried, fiddle-faddle kind of way, and hastily and confidentially ask across the counter, “Mr — [victims are always particular in saying *Master*], have you got such a thing as fourpence in ha'pence? I just want to pay a porter, and happen to have no change.” The specification of “fourpence in ha'pence,” though in reality nonsense, carries the day; it gives a plausibility and credit-worthiness to the demand that could not otherwise be obtained; and the unfortunate shopkeeper, carried away by the contagious bustle of the victim, plunges his hand, quick as thought, into the till, and before he knows where he is, he is minus a groat, and the victim has vanished from before him—and the whole transaction, reflected upon three minutes afterwards, seems as if it had been a dream.

The existence of a victim is the most precarious thing, perhaps, in the world. He is a man with no continuing dinner-place. He dines, as the poor old Earl of Findlater used to say, at the sign of the Mouth. It is a very strange thing, and what no one could suppose *a priori*, that the necessitous are greatly indebted to the necessitous. People of this sort form a kind of community by themselves, and are more kind to each other mutually than is any other particular branch of the public to them as a class. Thus, the little that any one has is apt to be shared by a great many companions, and all have a mouthful. The necessitous are also very much the dupes of the necessitous; they are all, as it were, creatures of prey, the stronger con-

stantly eating up the weaker. Thus a victim in the last stage preys upon men who are entering the set, and all prey more or less upon poor tradesmen, such as the above Walter Brown or James Gowans, who are only liable to such a spoliation because they are poor and anxious for business. We have known a victim, for instance, who had long passed the condition of being *jail-worthy*, live in a great measure upon a man who had just begun a career of victimization by being thrown into jail. This creature was content to be a kind of voluntary prisoner, for the sake of sharing the victuals and bed of his patron. It would astonish any man, accustomed, day after day, to go home to a spread table at a regular hour, to know the strange shifts which victims have to make in order to satisfy hunger—how much is done by raising small hard-wrung subsidies from former acquaintance—how much by duping—how much by what the Scotch people very expressively call *skeeking*—how much by subdivision of mites among the wretches themselves. Your victim is often witty, can sing one good comic song, has a turn for mimicry, or at least an amusing smack of worldly knowledge; and he is sometimes so lucky as to fall in with patrons little above himself in fortune, but still having something to give, who afford him their protection on account of such qualifications.

By way of illustrating these points, take the following instances of what may be called the *fag-victim*.

Nisbet of —, in Lanarkshire, originally a landed gentleman and an advocate at the Scottish bar, was a blood of the first water in the dissolute decade 1780-90, when, if we are to believe Provost Creech, it was a gentleman's highest ambition, in his street dress and manner of walking, to give an exact personation of the character of Filch in the Beggars' Opera. Nisbet at that period dressed a good deal above Filch, however he might resemble him in gait. He had a coat edged all round with gold lace, wore a gold watch on each side (an extravagant fashion then prevalent), and with his cane, bag-wig, and gold-buckled shoes, was really a fine figure of the pre-revolutionary era. His house was in the Canongate—a good flat in Chessell's Court—garrisoned only by a female servant called Nanny. Nisbet at length squandered away the whole of his estate, and became a victim. All the world fell away from him; but Nanny still remained. From the entailed family flat in Chessell's Court, he had to remove to a den somewhere about the Netherbow; Nanny went with him. Then came the period of wretchedness. Nanny, however, still stuck fast. The unfortunate gentleman could not himself appear in his woe-begone attire upon those streets where he had formerly shone a resplendent sun; neither could he bring his well-born face to solicit his former friends for subsidies. Nanny did all that was necessary. Foul day and fair day, she was to be seen gliding about the streets, either petitioning tradesmen for goods to her master on credit, or collecting food and money from the houses of his acquaintance. If a liquid alms was offered, she had a white tankard, streaked with smoky-looking cracks, for its reception; if the proffered article was a mass of flesh, she had a plate or a towel. There never was such a forager. Nisbet himself used to call her "true and trusty," by way of a compliment to her collective powers; and he finally found so much reason to appreciate her disinterested attachment, that, on reaching the usual fatal period of fifty, he made her his wife! What was the catastrophe of their story I never heard.

The second, and only other instance of the *fag-victim* which can be given here, is of a still more touching character than the above, and seems to make it necessary for the writer of this trifling essay to protest, beforehand, against being thought a scoffer at the misery of his fellow-creatures. He begs it to be understood that, however light be the language in which he speaks, he hopes that he can look with no less than respectful feelings upon human nature, in a suffering, and, more especially, a self-denying form.

Some years ago, there flourished, in one of the principal thoroughfares of Edinburgh, a fashionable perfumer, the inheritor of an old business, and a man of respectable connections, who, falling into dissolute habits, became, of course, very much embarrassed, and finally "unfortunate." In his shop

"From youth to age a reverend 'prentice grew;"

a man, at the time of his master's failure, advanced to nearly middle life, but who, having never been anywhere else since he was ten or twelve years of age, than behind —'s counter—Sundays and meal-hours alone excepted—was still looked upon by his master as "the boy of the shop," and so styled accordingly. This worthy creature had in the course of time become as a mere piece of furniture in the shop; his soul had *fraternised* (to use a modern French phrase) with his situation. The drawers and shottles, the combs, brushes, and bottles, had entered into and become part of his own existence; he took them all under the wide-spreading boughs of his affections; they were to him, as the infant to the mother, part of himself. He was on the best terms with every thing about the shop; the handles of all things were fitted to his hand; every thing came to him, to use a proverbial expression of Scotland, like the bowl of a pint-stoup. In fact, like a piece of wood placed in a petrifying spring, this man might be said to have been transfigured out of his original flesh and blood altogether, and changed into a creature participating in the existence and qualities of certain essences, per-

fumes, wigs, pomades, drawers, wig-blocks, glass-cases, and counters, forming the *material* of Mr —'s establishment. Such a being was, as may be supposed, a useful servant. He knew all the customers; he knew his master's whole form of practice, all his habits, and every peculiarity of his temper. And then the fidelity of the creature; but that was chiefly shown in the latter evil days of the shop, and during the victimhood of his master. As misfortune came on, the friendship of master and man became more intensely familiar and intimate than it had ever been before. As the proudest man, met by a lion in the desert, makes no scruple to coalesce with his servant in resisting it, so was — induced, by the devouring monster Poverty, to descend to the level, and make a companion, of his faithful "boy." They would at last go to the same tavern together, take the same Sunday walks—were, in reality, boon companions. In all —'s distresses the boy partook; if any thing "occurred about a bill," as Crabbe says, it was the "boy" who had the chief labour of its accommodation; he would scour the North and South Bridges, with his hat off, borrowing small silver *à l'improviste*, as if to make up change to a customer, till he had the necessary sum amassed. The "boy" at length became very much demoralised; he grew vicious towards the world, to be the more splendidly virtuous to his master: one grand redeeming quality, after the manner of Moses' serpent, had eaten up all the rest. It were needless to pursue the history of the shop through all its stages of declension. Through them all the "boy" survived, unshaken in his attachment. The shop might fade, grow dim, and die, but the "boy" never. The goods might be diminished, the Duke of Wellington might be sold for whisky, and his lady companions pawn their wigs for mutton pies; but the "boy" was a fixture. There was no pledging away his devoted, inextinguishable friendship. The master at last went to the Canongate jail—I say went to, in order to inform the sentimental part of mankind that imprisonment is seldom done in the active voice, people generally incarcerating themselves with the most philosophical deliberation, and not the least air of compulsion in the matter. The shop was still kept open, and the "boy" attended it. But every evening did he repair to the dreary mansion, to solace his master with the news of the day, see after his comforts, and yield up the prey which, jackall-like, he had collected during the preceding four-and-twenty hours. This prey, be it remarked, was not raised from the sale of anything in the shop. Every saleable article had by this time been sold. The only furniture was now a pair of scissors and a comb, together with the announcement, "Hair-cutting rooms," in the window. By means of these three things, however, the boy contrived generally to *fleece* the public of a few sixpences in the day; and all these sixpences, with the exception of a small commission for his own meagre subsistence, went to his master at the Canongate jail. Often, in the hour between eight and nine in the evening, have they sat in that small dingy back-room behind the large hall, enjoying a bottle of strong ale, drunk out of stoneware tumblers—talking over all their embarrassments, and speculating how to get clear of them. Other prisoners had their wives or their brothers to see after them; but we question if any one had, even in these relations of kindred, a friend so attached as the "boy." At length, after a certain period, this unfortunate tradesman was one evening permitted to walk away arm-in-arm with his faithful "young man," and the world was all before them where to choose.

For a considerable period all trace of the attached pair is lost. No doubt their course was through many scenes of poignant misery; for at the only part of their career upon which I have happened to obtain any light, the "boy" was wandering through the streets of Carlisle, in the dress and appearance of a very old beggar, and singing the songs wherewith he had formerly delighted the citizens of Edinburgh in Mrs Manson's or Johnnie Dowie's, for the subsistence of his master, who, as ascertained by my informant, was deposited in a state of sickness and wretchedness transcending all description, in a low lodging-house, in a back street. Such is the *fag-victim*, following his master

"To the last gasp with truth and loyalty."

And such, I may add, are the virtues which sometimes adorn the most vicious and degraded walks of life, where, to the eyes of ordinary observers, there appears no redeeming feature whatsoever.

THE GOOD PROVIDENCE OF GOD.

The more narrowly we examine the works of nature, the more and more are we convinced that the whole order of the universe is the result of *plan*, or a previous design on the part of a Deity. Perhaps the cause for ordure or putrescent matter having a bad smell, has never occurred to the minds of many individuals; yet that bad smell has been given for the wisest of purposes. It is in order that the objects producing the offensive scent may be carried out of sight and buried; and by being thus deposited under a covering of earth, assume new properties, and be the means of yielding a rich crop of new food. Here, then, it is demonstrated that cleanliness or the removal of every description of nuisances from the doors of cottages, and other places in the vicinity of the dwellings of man, is expressly ordained by God Almighty himself, and that he who is remiss in doing so absolutely resists the beneficent will of the Divinity. —Ed.

JOKES OF THE JACOBITES.

[From Scottish Jest and Anecdotes.]

[THIS celebrated party exhibited, at least so far as Scotland was concerned, all that propensity to wit and sarcasm which generally characterises a depressed faction, who dare not well appear either in arms or in letters. They had indeed a sort of armoury of jests, which they used in defect of better weapons, as a means of annoying the enemy; while many possessed a genuine talent for impromptu repartee. It is hoped that the following specimens of their wit and humour will be esteemed worthy of the space they occupy, if not in all cases for the success of the sally, at least as commemorating the moral peculiarities of a party, formerly important, but now completely extinct.]

NEW WARK AND AULD WARK.

The old Presbyterian general, David Leslie, it is well known, chose at the Restoration to repent of all the deeds of his youth, and express himself a sound and zealous loyalist. Charles II., it is also well known, made him a peer, under the title of Lord Newwark. A loyalist of older standing, and who had perhaps experienced some sound blows from Leslie's troopers in his younger days, is said to have remonstrated with the king upon a proceeding which showed so much disrespect for his old friends. "By my soul," said this bold cavalier, "instead o' raising him to the peerage for his new wark, there waud ha' been mair justice if your majesty had raised him to the gallows for his auld wark."

EARL OF R——.

The Earl of R——, eighty years ago, was so weak in his mind, or rather so unmanageable, that his relations had to confine him in the Canongate jail, there being then no other asylum for the reception of lunatics at Edinburgh. Some English officers, belonging to the Duke of Cumberland's army, happening to visit the prison, and being informed that it had no less distinguished a tenant than an earl, asked his lordship, in much surprise, how he got into such a place as this. "Deed, gentlemen," replied the lunatic, whose mind, like that of other idiots, occasionally gave forth strange flashes of wit, as the darkest nights are illuminated by the brightest lightning, "I got in here, in somewhat the same manner that you got into the army—less by my ain deserts than by the interest of my friends."

His lordship, being brother-in-law to Lord Lovat, was suspected of Jacobitism, and, after the Highland army had gone to England, was examined on that account by some of the state officers. On its being imputed to him that he had wished well to the rebels while they remained in Edinburgh—"Me!" he cried, "me wish them weel! a pack o' nasty, lousy, low-lifed scoundrels—as I tell'd them they were—that wad never do ony gude in this world, but gang to the next on a widdy." "How!" cried the examiners, "did you really tell them so, my lord?" "That I did," said the earl; "only I loot them be twa mile away first."

NOT OUR LAWFUL SOVEREIGN.

An English regiment stationed at Peterhead, not long after the rebellion of 1745, received such polite attentions from the inhabitants, that the colonel determined, by way of expressing his gratitude, to invite the principal inhabitants to dinner. Among those selected for invitation, was Bishop Dunbar; but some one, on being told so by the colonel, remarked, that that person was only a Scotch bishop, and perhaps unworthy of the honour he designed to confer upon him. "Oh, never mind that," cried the Englishman; "my father was a bishop, and I respect the title, by whatever countryman it may be borne." Not satisfied with this, he called upon the bishop in person, and requested, in very respectful terms, the honour of his company. The bishop, who was a man of a very modest and retired mode of life, desired to be excused, on the plea of his age and infirmities, and also represented to the colonel, that, as his principles forbade him to join in certain public toasts, it would perhaps be just as agreeable to all parties that he should not attend. The colonel would by no means listen to any excuses, and at last succeeded in obtaining the old man's consent, though not before he had promised that no toast should be given at all calculated to offend the feelings of the guest. At dinner every thing proceeded well; but on "The King" being given, after the withdrawal of the cloth, and the bishop drinking it with the preliminary addition of the word "rightful," a cornet swore a violent oath, and exclaimed, "That is not King George, sir." "I take you all to witness," said the old clergyman, placidly, but with triumph beaming in his eye, "this young gentleman says King George is not our rightful sovereign!" This good thing was hailed by a burst of laughter at the cornet's expense.

MASSACRE OF GLENCOE.

A coach horse belonging to President Dalrymple, whose share in this odious transaction is well known, happening to *hang itself*, as the stable phrase goes, in the stall, an old testy coachman, of the name of John, was deputed from the stable to acquaint his lordship with the fact. The President, unable to comprehend how the animal should have accomplished its own death, and perhaps suspicious of negligence on the part of its attendants, questioned the man a good deal as to the manner of the accident; the great burden of his inquiries being, "But how, John, should the horse have hanged himself?" Quite out of patience with so many frivolous questions, John at length exclaimed,

"It certainly is a strange thing, my lord, that the pair beast should have hanged himself: I'm sure he had naething to do wi' either the revolution or the massacre o' Gencoe!"

CARNAGEY OF BALNAMOON.

It was the custom of old Balnamoon, a noted Jacobite, when out drinking at a friend's house, only to go home in case that he was able to sit upon his horse. If, when brought out and planted on horseback, he at once tumbled off, he remained all night where he was; but if he still preserved sufficient strength to enable him to sit upright, or even to hold by the mane, he trotted off. On such occasions he was always attended by a faithful old man-servant, who rode behind him, and observed that he did not drop himself by the way. One night, as the loving pair were going home in this way, Balnamoon tumbled off into a bog, from which it required unusual efforts on the part of John to extricate him. When he was fished out, a new difficulty arose—he had lost his wig. John immediately began an elaborate search through the neighbouring quagmires for Balnamoon's wig, and at last he was so fortunate as to find it. He instantly clapped it at random upon his master's head, and, as it afterwards appeared, with the back part foremost. He was then proceeding to mount his own horse, in order to pursue the way home, when Balnamoon's voice was heard faintly to exclaim through the dripping curls which hung round his face, "Oh, John, man, this is surely no my wig, for it does na fit me ava." "Deil care, Bonnymoon," cried John; "ye maun just be content wi' what ye've got. *There's nae wale o' wigs here*;"—an expression which has since become proverbial in the country.

A QUEEN IN THE TOLBOOTH.

It may be seen from the popular song entitled "The wee wee German Lairdie," with how much contempt the Jacobites beheld the first prince of the Brunswick dynasty. Unfortunately, his majesty's domestic circumstances supplied them with an incident which gave ample scope to their satire. This was the alleged infidelity of his consort, who, on account of a supposed intrigue with a German count, was said, at the period of King George's accession, to be suffering imprisonment in one of his foreign castles. The frequent allusions to this affair in their songs go far to induce a supposition that they almost revenged, by its means, the absurd but annoying state fiction which asserted their own king to be a supposititious child. They have been heard to relate, with peculiar satisfaction, a remark which an Aberdeen magistrate is said to have made upon King George's consort. At the first occurrence of the king's birthday after his accession, the public functionaries of this ancient city being assembled to drink his health, one of them, who, it appeared, was ignorant of the domestic history of the royal family, rose up and asked, in his peculiar dialect, "Phat was to hinder them to drink the queen's health tee?" "Hout, awa man," replied the provost, pulling him back into his seat; "*she's i' the Towbeeth!*"—*To be continued.*

SIR FRANCIS BURDETT.

In the same paper in which Hazlitt details the characteristics of Brougham, he treats of the peculiarities of Sir Francis Burdett, and in an equally correct manner. "Sir Francis," says he, "in many respects affords a contrast to the foregoing character. He is a plain, unaffected, unsophisticated English gentleman. He is a person of great reading too, and considerable information, but he makes very little display of these, unless it be to quote Shakspeare, which he does often with extreme aptness and felicity. Sir Francis is one of the most pleasing speakers in the house, and is a prodigious favourite of the English people. So he ought to be; for he is one of the few remaining examples of the old English understanding, and old English character. All that he pretends to is common sense and common honesty; and a greater compliment cannot be paid to these than the attention with which he is listened to in the house. We cannot conceive a higher proof of courage than the saying things which he has been known to say there; and we have seen him blush and appear ashamed of the truths he has been obliged to utter, like a bashful novice. He could not have uttered what he often did there, if, besides his general respectability, he had not been a very honest, a very good-tempered, and a very good-looking man. But there was evidently no wish to shine, nor any desire to offend. It was painful to him to hurt the feelings of those who heard him, but it was a higher duty in him not to suppress his sincere and earnest convictions. It is wonderful how much virtue and plain-dealing a man may be guilty of without impunity, if he has no vanity, or ill-nature, or duplicity, to provoke the contempt or resentment of others, and to make them impatient of the superiority he sets up over them. There is no honest cause which he dares not avow—no oppressed individual that he is not forward to succour. He has the firmness of manhood, with the unimpaired enthusiasm of youthful feeling about him. His principles are mellowed and improved, without having become less sound, with time; for at one period he sometimes appeared to come charged to the house with the petulance and caustic sententiousness he had imbibed at Wimbledon Common. He is seldom or never violent, or in extremes. There is only one error he seems to labour under (which, we believe, he also borrowed from Mr Horne Tooke or Major Cartwright), the wanting to go back to the early times of our constitution and history in search of the principles of law and liberty—which are modern inventions—the growth of books and printing. A man may be a patriot without being an antiquary. This is the only point on which Sir Francis is at all inclined to a tincture of pedan-

try. His humanity is unconstrained and free. His heart does not ask leave of his head to feel, nor does prudence always keep a guard upon his tongue or his pen. He is the idol of the people of Westminster; few persons have a greater number of friends and wellwishers; and he has still greater reason to be proud of his enemies, for his integrity and independence have made them so."

BIOGRAPHIC SKETCHES.

JAMES WATT.

ALL the inventions and improvements of recent times, if measured by their effects upon the condition of society, sink into insignificance when compared with the extraordinary results which have followed the employment of steam as a mechanical agent. To one individual, the illustrious Watt, the merit and honour of having first rendered it extensively available for that purpose, are pre-eminently due. The force of steam, now so important an agent in mechanics, was nearly altogether overlooked until within the last two centuries. The ancients were in a small measure acquainted with its expansive powers; its prodigious energies were noticed by a French writer, Solomon de Caus, who flourished in the beginning of the seventeenth century; in the decade of 1660, the Marquis of Worcester similarly remarked the properties of steam; about twenty years later, Sir Samuel Morland projected a method of employing it as a mechanic power; and Denis Papier, a native of France, about the year 1690, contrived an engine acting with steam and the pressure of the atmosphere, for lifting water, but on an exceedingly rude principle. The next who tried such a scheme was Captain Savery, who about the year 1698 began to erect engines for lifting water, somewhat on the principle of the sucking-pump. Not long after Savery had invented his engine, Thomas Newcomen, an ironmonger, and John Calley, a glazier, both of Dartmouth in Devonshire, began also to direct their attention to the employment of steam as a mechanic power. Their first engine was constructed about the year 1711. This machine still acted on the principle of condensing the steam by means of cold water, and the pressure of the atmosphere on the piston. It was found of great value in pumping water from deep mines; but the mode of its construction, the great waste of fuel, the continual cooling and heating of the cylinder, and the limited capacities of the atmosphere in impelling the piston downward, all tended to circumscribe its utility. Our knowledge of what might be done by steam was in this state, when the subject at last happily attracted the attention of Mr Watt.

James Watt was born at Greenock, on the 19th of January 1736. His father was a merchant, and also one of the magistrates of that town. He received the rudiments of his education in his native place; but his health being even then extremely delicate, as it continued to be to the end of his life, his attendance at school was not always very regular. He amply made up, however, for what he lost in this way, by the diligence with which he pursued his studies at home, where without any assistance he succeeded at a very early age in making considerable proficiency in various branches of knowledge. Even at this time his favourite study is said to have been mechanical science, to a love of which he was probably in some degree led by the example of his grandfather and his uncle, both of whom had been teachers of the mathematics, and had left a considerable reputation for learning and ability in that department. Young Watt, however, was not indebted to any instructions of theirs for his own acquirements in science, the former having died two years before, and the latter the year after, he was born. At the age of eighteen he was sent to London to be apprentice to a maker of mathematical instruments; but in little more than a year, the state of his health forced him to return to Scotland, and he never received any further instruction in his profession. A year or two after this, however, a visit which he paid to some relations in Glasgow suggested to him the plan of attempting to establish himself in that city, in the line for which he had been educated. In 1757, accordingly, he removed thither, and was immediately appointed mathematical instrument maker to the college. In this situation he remained for some years, during which, notwithstanding almost constant ill health, he continued both to prosecute his profession, and to labour in the general cultivation of his mind, with extraordinary ardour and perseverance. Here, also, he enjoyed the friendship and intimacy of several distinguished persons who were then members of the university, especially of the celebrated Dr Black, the discoverer of the principle of latent heat, and Mr (afterwards Dr) John Robison, so well known by his treatises on mechanical science, who was then a student, and about the same age with himself. Honourable, however, as his present appointment was, and important as were many of the advantages to which it introduced him, he probably did not find it a very lucrative one; and, therefore, in 1763, when about to marry, he removed from his apartments in the university to a house in the city, and entered upon the profession of a general engineer.

For this his genius and scientific attainments admirably qualified him. Accordingly, he soon acquired a high reputation, and was extensively employed in making surveys and estimates for canals, harbours, bridges, and other public works. His advice and assistance indeed were sought for in almost all the im-

portant improvements of this description which were now undertaken or proposed in his native country. But another pursuit, in which he had been for some time privately engaged, was destined ere long to withdraw him from this line of exertion, and to occupy his whole mind with an object still more worthy of its extraordinary powers.

While yet residing in the college, his attention had been directed to the employment of steam as a mechanical agent, by some speculations of his friend Mr Robison, with regard to the practicability of applying it to the movement of wheel-carriages; and he had also himself made some experiments with Papin's digester, with the view of ascertaining its expansive force. He had not prosecuted the inquiry, however, so far as to have arrived at any determinate result, when, in the winter of 1763-4, a small model of Newcomen's engine was sent to him by the Professor of Natural Philosophy to be repaired, and fitted for exhibition in the class. The examination of this model set Watt upon thinking anew, and with more interest than ever, on the powers of steam. Struck with the radical imperfections of the atmospheric engine, he began to turn in his mind the possibility of employing steam in mechanics, in some new manner which should enable it to operate with much more powerful effect. This idea having got possession of him, he engaged in an extensive course of experiments, for the purpose of ascertaining as many facts as possible with regard to the properties of steam; and the pains he took in this investigation were rewarded with several valuable discoveries. The rapidity with which water evaporates, he found, for instance, depended simply upon the quantity of heat that was made to enter it, and this again on the extent of the surface exposed to the fire. He also ascertained the quantity of coals necessary for the evaporation of any given quantity of water, the heat at which water boils under various pressures, and many other particulars of a similar kind, which had never before been accurately determined.

Thus prepared by a complete knowledge of the properties of the agent with which he had to work, he next proceeded to take into consideration, with a view to their amendment, what he deemed the two grand defects of Newcomen's engine. The first of these was the necessity arising from the method employed to concentrate the steam, of cooling the cylinder, before every stroke of the piston, by the water injected into it. On this account, a much more powerful application of heat than would otherwise have been requisite was demanded for the purpose of again heating that vessel when it was to be refilled with steam. In fact, Watt ascertained that there was thus occasioned, in the feeding of the machine, a waste of not less than three-fourths of the whole fuel employed. If the cylinder, instead of being thus cooled for every stroke of the piston, could be kept permanently hot, a fourth part of the heat which had been hitherto applied would be found to be sufficient to produce steam enough to fill it. How, then, was this desideratum to be attained? Savery, the first who really constructed a working engine, and whose arrangements, as we have already remarked, all showed a very superior ingenuity, employed the method of throwing cold water over the outside of the vessel containing the steam—a perfectly manageable process, but at the same time a very wasteful one; inasmuch as, every time it was repeated, it cooled not only the steam, but the vessel also, which, therefore, had again to be heated, by a large expenditure of fuel, before the steam could be reproduced. Newcomen's method of injecting the water into the cylinder was a considerable improvement on this; but it was still objectionable on the same ground, though not to the same degree; it still cooled not only the steam, on which it was desired to produce that effect, but also the cylinder itself, which, as the vessel in which more steam was to be immediately manufactured, it was so important to keep hot. It was also a very serious objection to this last-mentioned plan, that the injected water itself, from the heat of the place into which it was thrown, was very apt to be partly converted into steam; and the more cold water was used, the more considerable did this creation of new steam become. In fact, in the best of Newcomen's engines, the perfection of the vacuum was so greatly impaired from this cause, that the resistance experienced by the piston in its descent was found to amount to about a fourth part of the whole atmospheric pressure by which it was carried down, or, in other words, the working power of the machine was thereby diminished one-fourth.

After reflecting for some time upon all this, it at last occurred to Watt to consider whether it might not be possible, instead of continuing to condense the steam in the cylinder, to contrive a method of drawing it off, to undergo that operation in some other vessel. This fortunate idea having presented itself to his thoughts, it was not very long before his ingenuity also suggested to him the means of realising it. In the course of one or two days, according to his own account, he had all the necessary apparatus arranged in his mind. The plan which he devised, indeed, was an extremely simple one, and on that account the more beautiful. He proposed to establish a communication by an open pipe between the cylinder and another vessel, the opening of which evidently would be, that when the steam was admitted into the former, it would flow into the latter so as to fill it also. If, then, the portion in this latter vessel only should be subjected to a condensing process, by

being brought into contact with cold water or any other convenient means, what would follow? Why, a vacuum would be produced here—into that, as a vent, more steam would immediately rush from the cylinder—that likewise would be condensed; and so the process would go on till all the steam had left the cylinder, and a perfect vacuum had been effected in that vessel, without so much as a drop of cold water having touched or entered it. The separate vessel alone, or the condenser, as Watt called it, would be cooled by the water used to condense the steam; and that, instead of being an evil, manifestly tended to promote and quicken the condensation. When Watt reduced these views to the test of experiment, he found the result to answer his most sanguine expectations. The cylinder, although emptied of its steam for every stroke of the piston as before, was now constantly kept at the same temperature with the steam (or 212° Fahrenheit); and the consequence was, that one-fourth of the fuel formerly required sufficed to feed the engine. But besides this most important saving in the expense of maintaining the engine, its power was greatly increased by the more perfect vacuum produced by the new construction, in which the condensing water, being no longer admitted within the cylinder, could not, as before, create new steam there while displacing the old.

Such, then, was the remedy by which the genius of this great inventor effectually cured the first and most serious defect of the old apparatus. In carrying his ideas into execution, he encountered, as was to be expected, many difficulties, arising principally from the impossibility of realising theoretical perfection of structure with such materials as human art is obliged to work with; but his ingenuity and perseverance overcame every obstacle. One of the things which cost him the greatest trouble was, how to fit the piston so exactly to the cylinder, as, without affecting the freedom of its motion, to prevent the passage of the air between the two. In the old engine this end had been attained by covering the piston with a small quantity of water, the dripping down of which into the space below, where it merely mixed with the steam introduced to effect the condensation, was of little or no consequence. But in the new construction, the superiority of which consisted in keeping this receptacle for the steam always both hot and dry, such an effusion of moisture, although only in very small quantities, would have occasioned material inconvenience. The air alone, besides, which in the old engine followed the piston in its descent, acted with considerable effect in cooling the lower part of the cylinder. His attempts to overcome this difficulty, while they succeeded in that object, conducted Watt also to another improvement, which effected the complete removal of what we have called the second radical imperfection of Newcomen's engine, namely, its non-employment, for a moving power, of the expansive force of the steam. The effectual way, it occurred to him, of preventing any air from escaping into the part of the cylinder below the piston, would be to dispense with the use of that element above the piston, and to substitute there likewise the same contrivance as below, of alternate steam and a vacuum. This was of course to be accomplished by merely opening communications from the upper part of the cylinder to the boiler on the one hand, and the condenser on the other, and forming it at the same time into an air-tight chamber, by means of a cover, with only a hole in it to admit the rod or shank of the piston, which might, besides, without impeding its freedom of action, be padded with hemp, the more completely to exclude the air. It was so contrived, accordingly, by a proper arrangement of the cocks and the machinery connected with them, that while there was a vacuum in one end of the cylinder, there should be an admission of steam into the other; and the steam so admitted now served, not only by its susceptibility of sudden condensation, to create the vacuum, but also, by its expansive force, to impel the piston.

These were the great improvements which Watt introduced in what may be called the principle of the steam-engine, or, in other words, in the manner of using and applying the steam. They constitute, therefore, the grounds of his claim to be regarded as the true author of the conquest that has at last been obtained by man over this powerful element. But original and comprehensive as were the views out of which these fundamental inventions arose, the exquisite and inexhaustible ingenuity which the engine, as finally perfected by him, displays in every part of its subordinate mechanism, is calculated to strike us perhaps with scarcely less admiration. It forms undoubtedly the best exemplification that has ever been afforded of the number and diversity of services which a piece of machinery may be made to render to itself by means solely of the various application of its first moving power, when that has once been called into action. Of these contrivances, however, we can only notice one or two, by way of specimen. Perhaps the most singular is that called the *governor*. This consists of an upright spindle, which is kept constantly turning, by being connected with a certain part of the machinery, and from which two balls are suspended in opposite directions by rods, attached by joints, somewhat in the manner of the legs of a pair of tongs. As long as the motion of the engine is uniform, that of the spindle is so likewise, and the balls continue steadily revolving at the same distance from each other. But as soon as any alteration in the action of the piston takes place, the balls, if it has become more rapid, fly farther apart under the influence of the increased centrifugal force which actuates them, or approach nearer to each other in the opposite circumstances. This alone would have served to indicate the state of matters to the eye; but Watt was not to be so satisfied. He connected the rods with the valve in the tube, by which the steam is admitted to the cylinder from the boiler in such a way, that, as they retreat from each other, they gradually narrow the opening which is so guarded, or enlarge it as they tend to collapse; thus diminishing the supply of steam when the engine is going too fast, and when it is not going fast enough, enabling it to regain its proper speed by allowing it an increase of aliment. Again, the

constant supply of a sufficiency of water to the boiler is secured by an equally simple provision; namely, by a float resting on the surface of the water, which, as soon as it is carried down by the consumption of the water to a certain point, opens a valve and admits more; and so on through all the different parts of the apparatus, the various wonders of which cannot be better summed up than in the forcible and graphic language of a recent writer:—"In the present perfect state of the engine, it appears a thing almost endowed with intelligence. It regulates with perfect accuracy and uniformity the number of its strokes in a given time, counting or recording them moreover, to tell how much work it has done, as a clock records the beats of its pendulum; it regulates the quantity of steam admitted to work, the briskness of the fire, the supply of water to the boiler, the supply of coals to the fire; it opens and shuts its valves with absolute precision as to time and manner; it oils its joints; it takes out any air which may accidentally enter into parts which should be vacuum; and when any thing goes wrong which it cannot of itself rectify, it warns its attendants by ringing a bell; yet with all these talents and qualities, and even when exerting the power of six hundred horses, it is obedient to the hand of a child. Its aliment is coal, wood, charcoal, or other combustible—it consumes none while idle—it never tires, and wants no sleep; it is not subject to malady when originally well made, and only refuses to work when worn out with age; it is equally active in all climates, and will do work of any kind; it is a water pumper, a miner, a sailor, a cotton-spinner, a weaver, a blacksmith, a miller, &c. &c.; and a small engine in the character of a steam pony may be seen dragging after it on a railroad a hundred tons of merchandise, or a regiment of soldiers, with greater speed than that of our fleetest coaches. It is the king of machines, and a permanent realisation of the geni of Eastern fable, whose supernatural powers were occasionally at the command of man."

In addition to those difficulties which his unrivalled mechanical ingenuity enabled him to surmount, Watt, notwithstanding the merit of his inventions, had to contend for some time with others of a different nature, in his attempts to reduce them to practice. He had no pecuniary resources of his own, and was at first without any friend willing to run the risk of the outlay necessary for an experiment on a sufficiently large scale. At last he applied to Dr Roebuck, an ingenious and spirited speculator, who had just established the Carron iron-works, not far from Glasgow, and held also at this time a lease of the extensive coal-works at Kinneal, the property of the Duke of Hamilton. Dr Roebuck agreed to advance the requisite funds, on having two-thirds of the profits made over to him; and upon this Mr Watt took out his first patent in the beginning of the year 1769. An engine, with a cylinder of eighteen inches diameter, was soon after erected at Kinneal; and although, as a first experiment, it was necessarily in some respects of defective construction, its working completely demonstrated the great value of Watt's improvements. But Dr Roebuck, whose undertakings were very numerous and various, in no long time after forming this connection found himself involved in such pecuniary difficulties, as to put it out of his power to make any farther advances in prosecution of its object. On this, Watt applied himself for some years almost entirely to the ordinary work of his profession as a civil engineer; but at last, about the year 1774, when all hopes of any farther assistance from Dr Roebuck were at an end, he resolved to close with a proposal which had been made to him through his friend Dr Small of Birmingham, that he should remove to that town, and enter into partnership with the eminent hardware manufacturer, Mr Boulton, whose extensive establishments at Soho had already become famous over Europe, and procured for England an unrivalled reputation for the arts there carried on. Accordingly, an arrangement having been made with Dr Roebuck, by which his share of the patent was transferred to Mr Boulton, the firm of Boulton and Watt commenced the business of making steam-engines in the year 1775.

Mr Watt now obtained from Parliament an extension of his patent for twenty-five years from this date, in consideration of the acknowledged national importance of his inventions. The first thing which he and his partner did was to erect an engine at Soho, which they invited all persons interested in such machines to inspect. They then proposed to erect similar engines wherever required, on the very liberal principle of receiving as payment for each, only one-third of the saving in fuel which it should effect, as compared with one of the old construction.

The draining of mines was one of the many applications of the steam-power now at his command, which Watt contemplated, and in course of time accomplished. During the whole twenty-five years, indeed, over which his renewed patent extended, the perfecting of his invention was his chief occupation; and, notwithstanding a delicate state of health, and the depressing affliction of severe headaches, to which he was extremely subject, he continued throughout this period to persevere with unwearied diligence in adding new improvements to the mechanism of the engine, and devising the means of applying it to new purposes of usefulness. He devoted, in particular, the exertions of many years to the contriving of the best methods of making the action of the piston communicate a rotatory motion in various circumstances, and between the years 1781 and 1785 he took out four different patents for inventions having this object in view.

This invention has already gone far to revolutionise the whole domain of human industry, and almost every year is adding to its power and its conquests. In our manufactures, our arts, our commerce, our social accommodations, it is constantly achieving what, little more than half a century ago, would have been accounted miracles and impossibilities. 'The trunk of an elephant,' it has been finely and truly said, 'that can pick up a pin, or rend an oak, is as nothing to it. It can engrave a seal, and crush masses of obdurate metal like wax before it—draw out, without breaking, a thread as fine as gossamer

—and lift a ship of war like a bauble in the air. It can embroider muslin and forge anchors; cut steel into ribbons, and impel loaded vessels against the fury of the winds and waves. And another application of it, which has been made only within the last few months, is perhaps destined to be productive of still greater changes on the condition of society than have resulted from many of its previous achievements. It had been employed some years ago, at some of our collieries, in the propelling of heavily laden carriages over railways; but the great experiment of the Liverpool and Manchester railway has, for the first time, practically demonstrated with what hitherto almost undreamt-of rapidity travelling by land may hereafter be carried on through the aid of steam. Coaches, under the impetus communicated by this, the most potent, and at the same time the most perfectly controllable of all our mechanical agencies, have already been drawn forward at the flying speed of thirty and thirty-five miles an hour. If so much has been done already, it would be rash to conclude that even this is to be our ultimate limit of attainment. In navigation, the resistance of the water, which increases rapidly as the force opposed to it increases, very soon sets bounds to the rate at which even the power of steam can impel a vessel forwards. But, on land, the thin medium of the air presents no such insurmountable obstacle to a force making its way through it; and a rapidity of movement may perhaps be eventually attained here, which is to us even as yet inconceivable. But even when the rate of land travelling already shown to be quite practicable shall have become universal, in what a new state of society shall we find ourselves! When we shall be able to travel a hundred miles in any direction in six or eight hours, into what comparative neighbourhood will the remotest extremes even of a large country be brought, and how little shall we think of what we now call distance! A nation will then be indeed a community; and all the benefits of the highest civilisation, instead of being confined to one central spot, will be diffused equally over the land, like the light of heaven. This improvement, in short, when fully consummated, will confer upon man nearly as much new power and new enjoyment as if he were actually endowed with wings.

It is gratifying to reflect, that even while he was yet alive, Watt received from the voice of the most illustrious of his contemporaries the honours due to his genius. In 1785 he was elected a Fellow of the Royal Society; the degree of Doctor of Laws was conferred upon him by the University of Glasgow in 1806; and in 1808 he was elected a member of the French Institute. He died on the 25th of August 1819, in the eighty-fourth year of his age."

RAEBURN AND JOHN CLERK.

Among Raeburn's earliest associates was the learned and witty John Clerk—afterwards a judge of the Court of Session, under the title of Lord Eldin—a gentleman of rare parts, who to his other acquirements added some skill of hand in the art of painting. The young artist and the young advocate were frequently together; and as the one had to purchase costly colours and the other expensive books, it is said they were sometimes so poor that they scarcely knew how to live till more money came in. On one of these occasions Raeburn received an invitation to dine with Clerk; and hastening to his lodgings, he found the landlady spreading a cloth on the table, and setting down two dishes, one containing three herrings, and the other three potatoes. "And is this all?" said John. "All!" said the landlady. "All! did I not tell ye, woman," he exclaimed, "that a gentleman was to dine with me, and that ye were to get six herrings and six potatoes?" "The tables of both were better furnished before the lapse of many years; and they loved, it is said, when the wine was flowing, to recall those early days, when hope was high, and the spirit unrebuked by intercourse with the world.—*Lives of British Painters.*

COUNTESS OF ORKNEY.

The following curious anecdote is related of Mary Countess of Orkney, who died not long since, aged 76:—She was deaf and dumb, and was married in 1753, by signs. She lived with her husband, who was also her first cousin, at his seat, Rostellan, on the harbour of Cork. Shortly after the birth of her first child—the lady is lately deceased—the nurse, with considerable astonishment, saw the mother cautiously approach the cradle in which the infant was sleeping, evidently full of some deep design. The countess having perfectly assured herself that the child really slept, took out a large stone, which she had concealed under her shawl, and to the horror of the nurse—who, like all persons of the lower order in her country, indeed in most countries, was fully impressed with an idea of the peculiar cunning and malignity of "dumbies"—raised it with an intent to fling it down vehemently. Before the nurse could interpose, the countess had flung the stone; not, however, as the servant had apprehended, at the child, but on the floor, where of course it made a great noise. The child immediately awoke, and cried. The countess, who had looked with maternal eagerness to the result of her experiment, fell on her knees in a transport of joy. She had discovered that her child possessed the sense which was wanting in herself. She exhibited on many other occasions similar proofs of intelligence, but none so interesting.

THREAD OF THE SPIDER.

The thread of the silk-worm is so small, that many folds are twisted together to form our finest sewing thread; but that of the spider is smaller still, for two drachms of it by weight would reach from London to Edinburgh, or 400 miles.—*Arnot's Physics.*

COLUMN FOR COUNTRY GENTLEMEN.

ENGLISH FOX-HUNTERS.

MELTON MOWBRAY, a small town in Leicestershire, generally contains from two to three hundred hunters, in the hands of the most experienced grooms England can produce, the average number being ten to each sportsman residing there, although some of those who ride heavy, and rejoice in long purses, have from fourteen to twenty for their own use. The stud of the Earl of Plymouth has for many years exceeded the last mentioned number. It may seem strange that one man should under any circumstances need so large a number of horses solely for his personal use in the field; and it must be admitted that few countries do require it. In Leicestershire, however, the universal practice is for each sportsman to have at least two hunters in the field on the same day—a practice proved to be economical, as it is from exhaustion, the effect of long-continued severe work, that the health of horses is most injured. And when it is considered that a horse should always have five days' rest after a moderate, and at least seven or eight after a severe run with hounds, it will not seem surprising that ten or twelve hunters should be deemed an indispensable stud for a regular Leicestershire sportsman. The sum total of expenses attending a stud of twelve hunters at Melton, including every outgoing, is, as nearly as can be estimated, £1,000 per annum. In all stables, the outlay for the purchase of horses is great—at least two hundred guineas each hunter; and in some the annual amount of tear and wear of horse flesh is considerable. Melton has been much improved owing to the numbers of comfortable houses which have been erected for the accommodation of its sporting visitors, who spend not less, on an average, than £50,000 per annum on the spot. It stands on one of the great north roads, eighteen miles from Nottingham, and fifteen from Leicester, which latter place is also a favourite resort of sportsmen. The town furnishes an interesting scene on each hunting morning. At rather an early hour are to be seen groups of hunters, the finest in the world, setting out in different directions to meet different packs of hounds. The style of my Meltonian fox-hunter has long distinguished him above his brethren of what he calls the provincial chase. When turned out of the hands of his valet, he presents the very *beau-ideal* of his caste. The exact Stultze-like fit of his coat—his superlatively well-cleaned breeches and boots—and the generally apparent high-breeding of the man, can seldom be matched elsewhere; and the most cautious sceptic in such points would satisfy himself of the fact at one single inspection.—*Quarterly Review*.

THE HUNT.

To describe a run with foxhounds is not an easy task; but to make the attempt with any other county than Leicestershire, in our eye would be giving a chance away. Let us then suppose ourselves at Ashby Pasture, in the Quorn country, with Mr Osbaldeston's hounds. Let us also indulge ourselves with a fine morning, in the first week of February, and at least two hundred well-mounted men by the cover's side. Time being called—say a quarter past eleven, nearly our great-grandfathers' dinner hour—the hounds approach the furze brake, or the gorse, as it is called in that region. "*Hark in, Hark!*" with a slight cheer, and perhaps one wave of his cap, says Mr Osbaldeston, who has long hunted his own pack, and in an instant he has not a hound at his horse's heels. In a very short time, the gorse appears shaken in various parts of the cover—apparently from an unknown cause, not a single hound being for some minutes visible. Presently one or two appear, leaping over some old furze which they cannot push through, and exhibit to the field their glossy skins and spotted sides. "*Oh you beauties!*" exclaims some old Meltonian, rapturously fond of the sport. Two minutes more elapse: another hound slips out of cover, and takes a short turn outside with his nose to the ground and his stern lashing his side—thinking no doubt he might touch on a drag, should Reynard have been abroad in the night. Hounds have no business to *think*, thinks the second whipper-in, who observes him; but one crack of his whip, with "*Rasselas, Rasselas, where are you going, Rasselas? Get to cover, Rasselas!*" and Rasselas immediately disappears. Five minutes more pass away. "*No fox here,*" says one. "*Don't be in a hurry,*" cries Mr Cradock; "*they are drawing in beautifully, and there is rare lying in it.*" These words are scarcely uttered, when the cover shakes more than ever. Every stem appears alive, and it reminds us of a corn-field waving in the wind. In two minutes the stems of some more hounds are seen "*flourishing*" above the gorse. "*Have at him there!*" hollas the squire—the gorse still more alive, and hounds leaping over each other's backs. "*Have at him there again, my good hounds—a fox for a hundred!*" reiterates the squire, putting his finger in his ear, and uttering a scream which not being set to music, we cannot give here. Jack Stevens (the first whipper-in) looks at his watch.

At this interesting period, a Snob, just arrived from a very rural country, and unknown to any one, but determined to witness the start, gets into a conspicuous situation: "*Come away, sir!*" hollas the master (little suspecting that the Snob may be nothing less than one of the *Quarterly Reviewers*); "*what mischief are you doing there? Do you think you can catch the fox?*" A breathless silence ensues. At

length a whimper is heard in the cover—like the voice of a dog in a dream; it is Flourisher, and the squire cheers him to the echo. In an instant a hound challenges—and another—and another. "*'Tis enough, 'Tallyho!*" cries a countryman in a tree. "*He's gone,*" exclaims Lord Alvanley: and, clapping spurs to his horse, in an instant is in the front rank.

As all good sportsmen would say, "*Ware, hounds!*" cries Sir Harry Goodricke. "*Give them time,*" exclaims Mr John Moore. "*That's right,*" says Mr Osbaldeston, "*spoil your own sport as usual.*" "*Go along,*" roars out Mr Holyoak; "*there are three couple of hounds on the scent.*" "*That's your sort,*" says Billy Coke, coming up at the rate of thirty miles an hour on *Advance*, with a label pinned on his back, "*she kicks;* the rest are all coming, and there's a rare scent to-day, I'm sure." Bonaparte's Old Guard, in its best days, would not have stopped such men as these, so long as life remained in them.

Only those who have witnessed it can know in what an extraordinary manner hounds that are left behind in a cover make their way through a crowd, and get up to the leading ones of the pack which have been fortunate in getting away with the fox. It is true they possess the speed of a race-horse; but nothing short of their high mettle could induce them to thread their way through a body of horsemen going at the best pace, with the prospect of being ridden over and maimed at every stride they take.

Up to this time "*Snob*" has gone quite in the first flight; the "*Dons*" begin to eye him, and, when an opportunity offers, the question is asked, "*Who is that fellow on the little bay horse?*" "*Don't know him,*" says Mr Little Gilmour (a fourteen-stone Scotchman, by the bye), ganging gallantly up to his hounds. "*He can ride,*" exclaims Lord Rancidiffe. "*A tip-top provincial, depend upon it,*" adds Lord Plymouth, going quite at his ease on a thorough-bred nag, three stone above his weight, and in perfect racing trim. Animal nature, however, will cry "*Enough,*" how good soever she may be, if unreasonable man press her beyond the point. The line of scent lies right athwart a large grass ground (as a field is termed in Leicestershire), somewhat on the ascent; abounding in ant-hills, or hillocks, peculiar to old grazing land, and thrown up by the plough some hundred years since into rather high ridges, with deep-holding furrows between each. The fence at the top is impracticable—Meltonic, "*a stopper;*" nothing for it but a gate, leading into a broad green lane, high and strong, with deep slippery ground on each side of it. "*Now for the timber-jumper,*" cries Osbaldeston, pleased to find himself upon Clasher. "*For heaven's sake, take care of my hounds, in case they may throw up in the lane,*" Snob is here in the best of company, and that moment perhaps the happiest of his life; but, not satisfied with his situation, wishing to out-Herod Herod, and to have a fine story to tell when he gets home, he pushes to his speed on ground on which all regular Leicestershire men are careful, and the death-warrant of the little bay horse is signed.

The scene now shifts. The fox does his best to escape; he threads hedgerows, tries the out-buildings of a farmhouse, and once turns so short as nearly to run his foil; but—the perfection of the thing—the hounds turn shorter than he does, as much as to say—*die you shall*. The pace has been awful for the last twenty minutes. Three horses are blown to a stand-still, and few are going at their ease. "*Out upon this great carcass of mine;* no horse that was ever foaled can live under it at this pace, and over this country," says one of the best of the welter-weights, as he stands over his four hundred guinea chestnut, then rising from the ground, after giving him a heavy fall—his tail nearly erect in the air, his nostrils violently distended, and his eyes almost fixed. "*Nothurt, I hope,*" exclaims Mr Maxse, to somebody whom he gets a glimpse of through the openings of a tall quickest hedge which is between them, coming neck and crop into the adjoining field, from the top bar of a high, hog-backed stile. His eye might have been spared the unpleasant sight, had not his ear been attracted to a sort of *procumbit hami bos* sound of a horse falling to the ground on his back, the bone of his left hip indenting the green-sward within two inches of his rider's thigh. It is young Peyton, who, having missed his second horse at the check, had been going nearly half the way in distress; but from nerve and pluck, perhaps peculiar to Englishmen, but very peculiar to himself, got within three fields of the end of this brilliant run. The fall was all but a certainty; for it was the third stiff-timber fence that had unfortunately opposed him, after his horse's wind had been pumped out by the pace; but he was too good to refuse them, and his horse knew better than to do so.

The *Æneid* of Virgil ends with a death, and a chase is not complete without it. The fox dies within half a mile of Woolwell-head, evidently his point from the first; the pack pulling him down in the middle of a large grass field, every hound but one at his brush. Osbaldeston's who-hoop might have been heard to Cottesmore, had the wind set in that direction, and every man present is ecstatic with delight. "*Quite the cream of the thing, I suppose,*" says Lord Gardner, a very promising young one, at this time fresh in Leicestershire. "*The cream of every thing in the shape of fox-hunting,*" observes that excellent sportsman Sir James Musgrave, looking at that moment at his watch. "*Just ten miles, as the crow flies, in one hour and ten minutes, with but two trifling checks, over the finest country in the world.*" "*What superb hounds are these!*" added the baronet, as he turned his horse's head to the wind. Some of the field now came up who could not live in the first flight; but as there is no jealousy here, they congratulate each other on the fine day's sport, and each man turns his head towards home.—*Ibid*

ON PRESERVING CORN IN SHEAVES.

The simplest method, it appears to me, for securing the crop after cutting it down, from being damaged by standing long in the stooks on the ground, is that universally practised by the agriculturist in the woody parts of Sweden and Norway, and which never fails in completely protecting at least nine-tenths of the grain from growing in the sheaf, as well as the straw from any serious injury. In those districts, every farmer provides as many corn-stakes (*i. e.* stakes for drying the grain on) as will be necessary for the quantity of his growing crop. They are generally made of the young white pines, eight feet long, about one and a half inch in diameter at the top, and four inches at the bottom. The upper end is pointed, to admit the sheaf passing easily down over it, and the lower end is likewise pointed to facilitate its being fixed in the ground. When a field of grain is ready for the sickle, the stakes are conveyed to the spot, and, as the reapers proceed with their work, the stakes are put up in rows behind them, in the same manner, and at the same distance from each other, as is common in stooking the crop. A man, with the assistance of an iron crow or spit, will set up five hundred of these in a day. The next operation is to put the sheaves on the stakes. This is performed by raising the first sheaf up to the top of the stake, and passing it with the root-ends downwards to the ground, the stake being kept as near as possible in the middle of the sheaf; the sheaf thus stands perpendicular and round the stake. The second sheaf is fixed on the stake in an inclined position with the grain-end sloping a little downwards, the stake passing through the sheaf at the band in a transverse manner, and in that position it is pressed down to the first sheaf, and thus forms a covering to it. All the other sheaves are threaded on the stake in a similar way as the sheaf last put on, keeping them all one above another, with the root-ends facing the south-west, to receive as much of the sunshine as possible, on account of the greater quantity of grassy substance which they contain at the other end. As each sheaf thus acts as a complete covering to the one beneath it, and as there is only one which can touch the ground, rain cannot at any time penetrate through them, and it is very rare that any single heads of grain on a stake are injured. I have witnessed these operations performed with as much expedition as actually attends the common way of setting the crop in the fields in stooks.—*Mr Carmichael of Kipploch, in Agricultural Journal*.

THE INDIAN MUSSULMAUNS' CELEBRATION OF THE NEW YEAR.

The exact period of commencing the Mussulmaun new year is the very moment of the sun's entering the sign Aries. This is calculated by those practical astronomers who are in the service of most great men in native cities—I should tell you they have not the benefit of published almanacs as in England; and according to the hour of the day or night when the sun passes into that particular sign, so are they directed in the choice of a colour to be worn in their garments on this eade; if at midnight, the colour would be dark puce, almost a black; if at mid-day, the colour would be the brightest crimson. Thus, to the intermediate hours are given a shade of either colour applicable to the time of night or the day when the sun enters the sign Aries; and whatever be the colour to suit the hour of Nou-Roze, all classes wear the day's livery, from the king to the meanest subject in the city. The king on his throne sits in state to receive congratulations and nuzzas from his nobles, courtiers, and dependents. "*Mabarakh Nou-Roze!*" (may the new year be fortunate!) are the terms of salutation exchanged by all classes of society, the king himself setting the example. The day is devoted to amusements, a public breakfast at the palace, sending presents, exchanging visits, &c. The trays of presents prepared by the ladies for their friends are tastefully set out, and the work of many days' previous arrangement. Eggs are boiled hard; some of these are stained in colours resembling our mottled papers; others are neatly painted in figures and devices, many are ornamented with gilding—every lady evincing her own peculiar taste in the prepared eggs for "*Nou-Roze.*"—*Mrs Meer Hassan Ali's Observations*.

COBALT.

About the end of the fifteenth century, cobalt appears to have been dug up in great quantity, in the mines on the borders of Saxony and Bohemia. As it was not known at first to what purpose it could be applied, it was thrown aside as a useless mineral. The miners had an aversion to it, not only because it gave them much fruitless labour, but because it often proved prejudicial to their health, by the arsenical particles with which it was combined; and it appears even that the mineralogical name *cobalt* then first took its rise. Frisch derives it from the Bohemian word *kow*, which signifies metal; but the conjecture that it was formed from *coballus*, which was the name of a spirit that, according to the superstitious notions of the times, haunted mines, destroyed the labours of the miners, and often gave them a great deal of unnecessary trouble, is more probable. The miners, perhaps, gave this name to the mineral out of joke, because it thwarted them as much as the supposed spirit, by exciting false hopes, and rendering their labour often fruitless. It was once customary to introduce into the church service a prayer, that God would preserve miners and their works from *Kobolts* and spirits.—*Beckmann*.

PSALMODY.

It was in the course of the sixteenth century that the psalmody of England, and the other Protestant countries, was brought to the state in which it now remains, and in which it is desirable that it should continue to remain. For this psalmody we are indebted to the Reformers of Germany, especially Luther, who was himself an enthusiastic lover of music, and is believed to have composed some of the finest tunes, particularly the Hundredth Psalm, and the hymn on the Last Judgment, which Braham sings with such tremendous power at our great performances of sacred music.—*Metropolitan*.

INFANTINE INQUIRIES.

[FROM A RECENTLY PUBLISHED VOLUME OF POEMS, BY
WILLIAM PENNYCOOK BROWN.]

"Tell me, O mother! when I grow old,
Will my hair, which my sisters say is like gold,
Grow grey as the old man's, weak and poor,
Who asked for alms at our pillared door?
Will I look as sad, will I speak as slow
As he, when he told us his tale of woe?
Will my hands then shake, and my eyes be dim?
Tell me, O mother! will I grow like him?"

"He said—but I knew not what he meant—
That his aged heart with sorrow was rent.
He spoke of the grave as a place of rest,
Where the weary sleep in peace, and are blest;
And he told how his kindred there were laid
And the friends with whom in his youth he played;
And tears from the eyes of the old man fell,
And my sisters wept as they heard his tale!"

"He spoke of a home, where, in childhood's glee,
He chased from the wild-flowers the singing bee;
And followed afar, with a heart as light
As its sparkling wings, the butterfly's flight;
And pulled young flowers, where they grew 'neath the
beams
Of the sun's fair light, by his own blue streams;
Yet he left all these through the earth to roam!
Why, O mother! did he leave his home?"

"Calm thy young thoughts, my own fair child!
The fancies of youth and age are beguiled;
Though pale grow thy cheeks, and thy hair turn grey,
Time cannot steal the soul's youth away!
There's a land of which thou hast heard me speak,
Where age never wrinkles the dweller's cheek;
But in joy they live, fair boy! like thee—
It was there the old man longed to be."

"For he knew that those with whom he had played,
In his heart's young joy, 'neath their cottage shade—
Whose love he shared, when their songs and mirth
Brightened the gloom of this sinful earth—
Whose names from our world had passed away,
As flowers in the breath of an autumn day—
He knew that they, with all suffering done,
Encircled the throne of the Holy One!"

"Though ours be a pillared and lofty home,
Where 'Want with his pale train never may come,
Oh! scorn not the poor, with the scorner's jest,
Who seek in the shade of our hall to rest;
For He who hath made them poor may soon
Darken the sky of our glowing noon,
And leave us with woe, in the world's bleak wild!
Oh! soften the griefs of the poor, my child!"

ENGLAND AND SCOTLAND.

THE following masterly and instructive sketch of the advantages of the Union of Scotland and England in 1707, is abridged from an article in the *CHAMELEON*, a *melange* of prose and poetical pieces lately published by Messrs Atkinson and Co., Glasgow:—

"In the nature of things, by the constitution of society—in an union for security—in a compact for safety—in a bond for even equal gain, the strongest *must* reap fewest benefits—the richest least of profit—the weakest most of both. And where honour is not sacrificed, nor liberty abridged, he is as little of a patriot as he is of a philosopher, who would oppose such an amicable coalescence with fanciful anticipations and vague generalities of speech. Why, by what means is it that states advance in refinement, and countries in civilisation? By the combination of many small and detached bodies into one compact whole;—by, first, the union of families—next of tribes—of clans—of districts, and of kingdoms—England has had its heptarchy—Ireland its many co-existent monarchs—Scotland its coeval kings. But mankind soon learn the value of union, and of the division of labour; and petty states join to form nations, who would else have wasted their energies in predatory warfare and perpetual heartburnings.

Nature meant that England and Scotland should be one and incorporate; and history will tell us how soon this was discovered, and how often it was attempted to be achieved. Never did a chance of rationally uniting the two kingdoms offer, but it was eagerly seized upon, and judged to be of mutual advantage by the wise of both. And happy would it have been for our country had its Margaret become the wife of England's second Edward, or its fifth James the spouse of Henry's daughter! At length, however, in the person of James the Sixth, such junction, in as far as identity of arbitrary rule could make a union, was effected. But with the departure of Scotland's monarchs, all the advantages of independence fled, while the more solid benefits of incorporation were not received in return.

At length, by the wisdom of Somers, and the ripening of events, was consummated the marriage of the States, and GREAT BRITAIN took its name among nations, unquestionably to the peace of both countries; but it is required to say, whether more to the general advantage of the one than the other, and to which? This I have already done, by reference to first principles; but as it is also a question of fact, by facts shall the question be answered. What, then, was the state and

condition of England—what that of Scotland, immediately antecedent to this event; what their condition subsequent to it—what their aspect now? Need I tell you that England was then in its most 'high and palmy state';—that the effervescence of its glorious revolution had subsided, but that the pure and invigorating principles of it were still in healthful play and circulation through the state; that its intellect was roused, as were its liberties refreshed, from their long slumber; that its revenue was growing; its commerce giving rich promise of its after grandeur; its people contented; and its wealth increased? Or need I remind you that the glories of Blenheim and of Ramilies were then in their first lustre? Why, this was the era of Somers and of Godolphin, of Addison and of Pope, of Swift and Steele, of Peterborough and of Churchill! Well, indeed, might a Scottish lord (Belhaven) exclaim, 'England is a great and glorious nation. Its armies are numerous, powerful, and victorious; its trophies splendid and memorable. She disposes of the fate of kingdoms. Her navy is the terror of Europe. Her trade and commerce encircle the globe, and her capital is the emporium of the universe!' Such then was England—free and happy, rich and powerful England; but 'look on that picture and on this—the counterfeit presentment of two brothers!' Oh my beloved country, pride but half o'erpowers regret when I know what thou art, but must show what thou hast been! It is the same painter that draws the picture of both; and Belhaven uttered but the truth when he then said, 'but we are a poor and obscure people in a remote corner of the world, without name, without alliances, and without fortune.' Then, without a present name, and existing but on the recollection of the past. Indeed, nothing could be more wretched than the condition of the Scottish people. A Revolution following a Restoration had left the minds of men in a feverish and unsettled state, and the tyranny of factious and rival nobles, who sought to perpetuate the worst forms of government, and oligarchical aristocracy, and to revivify the expiring embers of the feudal fire which clanship cherished, was but one remove from the bloody oppressions of Charles's time, and the troubles of his successors' reigns. Atholl might summon to arms, and maintain 10,000 men beneath his private banners, and Hamilton and Queensberry keep the retinues of rival princes; but the body of the people were poverty-stricken; and we have the able Fletcher of Saltoun's high authority for believing that almost every sixth man in Scotland was a public beggar! Indeed, from the accession of James to the English throne, our trade had decayed, and our capital, like our court, had emigrated to securer haunts. Famine overspread the land; agriculture was at a stand, and our trade was too inconsiderable to yield a revenue adequate to the necessities of the state. What little did accrue was the prey of rapacious statesmen, and those, their minions, to whom it had been impropitiously farmed. The flag of Scotland floated above no rich galleons—Dutch vessels it was that entered our harbours, and even fished upon our coasts. We had no peculiar native product for exchanging; nothing that we held not in common with more powerful rivals, save our cattle and our wool—and these England refused to receive; whilst her colonies were as much shut against our citizens as against the French or Dutch; nay, M'Pherson's *Annals of Commerce* show that, from the seventeenth year preceding the Union, the interchange of commodities had fallen off from £124,000 in value annually, to one-seventh part of that sum! It is idle to oppose to this statement the convulsive efforts which our expiring commercial energies made to establish the colony at Darien. These but emphatically confirm their truth; while their history recalls the humiliating remembrance of indignities which we were too weak to resent, and encroachments which we had not power to resist.

Whence was this weakness—this national atrophy? Poverty produced—Misgovernment prolonged it. In this situation of our country—the neighbour of a rich and powerful rival—to become its servant was inevitable, if we refused to be its friend, and to accept the community of interests which it proffered. Anarchy and injustice are the natural concomitants of weakness and misrule; and the Parliament of Scotland, the Council of State, and the Bench of Justice, were then alike corrupt and hideous. The Legislative Assembly was a heterogeneous mass of Peers—a majority of whom could at any time be procured by royal creation—and of pensioned Commoners, Jacobites, and Republicans; of such extremes as Atholl and Fletcher, Marchmont and Queensberry.

But the work of uniting the two nations—a triumph before which all other glories of the reign of Anne fade and grow dim—began on the 16th April, terminated in part of the 23d July 1706, and was finally consummated on the 1st of May in the year following.

To some of its articles it is necessary I should advert, and upon its general consequences that I should enlarge. And, first, I will address myself to the consideration of what it deprived us, before I enter upon the statements of the acquisitions which it made ours. Of what then did it denude us? Of a name—and of a parliament—and of a council. Of a name, I will admit, hallowed to us by a thousand kindling recollections, but not more so than that of England to its sons, which was also merged into the now prouder appellation of this island—Great Britain; of a legislature, whose corruptions made it a curse; of a council, whose tyranny would have become intolerable; while it transferred a portion of the Scottish intellect and hereditary dignity to an arena where the noblest battles of freedom had been fought, and where the proudest triumphs of mind and eloquence had been achieved. But I will be told that this transfer was inadequate and a mockery, and that the rights of Scotland were juggled with and sold. I broadly deny that the transfer was then inadequate, and I assert that, if it diminished the number of our legislators, it enhanced their dignity, by extending the sphere of their influence, and widening the field of their deliberations and exertions.

The activity which distinguishes our national character, and which led us to threaten rebellion when irritated and unemployed, and made us turbulent when prosperous, it instantly turned into useful channels and to better purposes, and soon substituted security for violence, industry for idleness, and wealth for poverty. Security, by, in the very year of its completion, sheltering us from a French invasion, through the protection of what had then become our united, and, even at that period, irresistible naval power and pretensions: Industry, by opening up spheres of employment for the energies of Scotsmen, who, within a year of its date, spread themselves, and, it is our boast, with themselves spread habits of diligence and principles of unbending integrity, over every country and in every clime that owned the British sway, and which had before been shut up and unapproachable to them.

If triumphs were of old allotted to him who spread devastation in a country, and conquered tranquillity by the sword, what ought to be their meed who win such peace, perpetual peace, without shedding one drop of gore; who heal wounds that for centuries had bled, and whose victories are the prevention of wars?"

THE HAGUE.

The Hague is the residence of the Dutch court. It was the birthplace of our William III. The population may be about forty thousand. It is a handsome and well built town, more in the German than the Dutch style; more like Brussels than Rotterdam. The happy union it exhibits of town and country is that which forms its chief interest. The Voorhout, or principal street, has several rows of trees in the centre, with a carriage-way on either side, while walks in the middle, covered with shells, are assigned to pedestrians. A beautiful park, well wooded and drained, affords a variety of pleasant promenades to the inhabitants, a great proportion of whom are men of property, retired from business. At the extremity of this park, which is two miles long, stands the summer residence of the princes of Orange, called the "Palace in the Wood." The approach to it is through a forest of oaks, which are regarded with superstitious veneration, and never submitted to the pruning hand of the woodman. The chambers of lords and deputies are fine structures, but inferior to those in Paris. The royal museum has been transferred to a house built in 1640, by Prince Maurice. It contains some remarkable pictures by Rembrandt, Paul Potter, Teniers, Wouvermans, Rubens, and other painters of the Flemish school. Among the choicest of this collection are the celebrated bull by Potter, and Simeon and the infant Jesus by Rembrandt, which justly merit the high place they hold in the estimation of Europe. Under the museum is a cabinet of Chinese curiosities, the most remarkable of which is a model of the interior of a Dutch town, made for Peter the Great of Russia, but refused on account of the high price fixed on it. In another room is a model of the Japanese island Tesima, representing the inhabitants in characteristic costumes, either engaged in the various duties of life on land, or dimpling the surface of the water in their eastern junks. In the king's palace is an elegant jasper vase, of the size and shape of a large baptismal font. It is exhibited as a present from the King of Prussia, and the most superb specimen of its kind in this part of Europe.—*Elliot's North of Europe.*

CHAIN BRIDGES.

It appears from a description of bridges of suspension, communicated some years since by R. Stevenson, Esq., civil engineer, to the Edinburgh Philosophical Society, that the first chain bridge constructed in this country is believed to have been one over the Tees, forming a communication between the counties of Durham and York. It is supposed, on good authority, to have been erected about 1741, and is described in Hutchinson's *Antiquities of Durham*, as "a bridge suspended on iron chains, stretched from rock to rock over a chasm near sixty feet deep, for the passage of travellers, particularly miners. The bridge is seventy feet in length, and a little more than two feet broad, with a hand rail on the one side, and planked in such a manner that the traveller experiences all the tremulous motion of the chain, and sees himself suspended over a roaring gulf, on an agitated and restless gangway, to which few strangers dare trust themselves." In 1816-17, two or three bridges of iron-wire were constructed; the first by Mr Lees, an extensive woollen manufacturer at Galashiels in Scotland. This experiment, although made with slender wires, and necessarily imperfect in its construction, deserves to be noticed as affording a practical example of the tenacity of iron so applied. These wire bridges were suspended not on the catenarian principle so successfully adopted in the larger works subsequently undertaken, but by means of diagonal braces, radiating from their points of suspension on either side towards the centre of the roadway. The unfortunate fabric next mentioned was constructed on this defective principle. Among the earliest practical exhibitions of this novel architecture in the United Kingdom, may be mentioned the uncommonly elegant and light chain bridge which was in 1817, for the convenience of foot passengers, thrown over the Tweed at Dryburgh, by the Earl of Buchan. Its length between the points of suspension was 261 feet, being considered the greatest span of any bridge in the kingdom. This useful structure, the theme of such just applause, and which harmonised so finely with the far-famed scenery of Dryburgh Abbey, was entirely destroyed by a tremendous gale of wind, at the beginning of the year following its erection. This bridge was subsequently restored.—*Lardner.*

EDINBURGH: Published, weekly, by W. and R. Chambers, 19, Waterloo Place; Or & Smith, Paternoster-row, London; and Young and Cunningham, Dublin.—Agent in Glasgow, John Macleod, 20, Argyre Street; and sold by all other Booksellers in Great Britain and Ireland.

EDINBURGH CHAMBERS' JOURNAL

CONDUCTED BY WILLIAM CHAMBERS, AUTHOR OF "THE BOOK OF SCOTLAND," "GAZETTEER OF SCOTLAND," &c.

No. 9. SATURDAY, MARCH 31, 1832. PRICE THREE HALFPENCE.

FALLACIES OF THE YOUNG. "ACQUAINTANCES."

ONE of the most important concerns of young people is the management of themselves in respect of what are called "Acquaintances." To have many friends is desirable, in a world where men are generally thrown so much upon their own resources. But there is a distinction between the friendship of a certain number of respectable persons, who are only ready to exert themselves for us when called upon, and the acquaintance of a circle of contemporaries, who are perpetually forcing themselves upon our company for the mere purpose of mutual amusement. Taking the words in their usual signification, a young man ought to wish for many friends, but few acquaintances. There is something in the countenance of a companion that cheers and supports the frailty of human nature. One can speak and act more boldly with a friend by his side, than when alone. But it is the good fortune of men of strong character, and it ought to be the object of every one, to act well and boldly by himself. One thing young people may be assured of: almost all the great services which enlightened men have done for their race were performed alone. There was but one man, not two, at the discovery of the compass, of the Copernican system, of the logarithms, and of the principle of vaccination. To descend to lesser things, ask any man who has risen in worldly fortune, from small beginnings to great wealth and honour, how he contrived to do so, and you will find that he carved it all out for himself with his own hand. He will in all probability inform you that he has reached the honourable station in society which he now maintains, chiefly by narrowing the circle of his "private acquaintances," and extending that of his "public relations;" most likely adding, that, had he on all occasions "consulted" the persons with whom he happened to be acquainted, as to his designs, he would, by every calculation, have been still in the same obscure insignificant situation he once was. The truth is, it is only when alone that we have the ability to concentrate our minds upon any object; and it is only when things are done with the full force of *one mind* qualified for the purpose, that they are done well. It is the misfortune of young people, before they become fully engaged in the relations of life and business, that they look too much to "acquaintances" for encouragement, and make the amusement which "acquaintances" can furnish too indispensable. The tender mind of youth is reluctant or unable to stand alone; it needs to be one of a class. Hence, the hours which ought to be spent in the acquisition of that general knowledge which is so useful in after-life, and which can only be acquired in the vacant days of youth, are thrown away in the most inglorious pursuits; for "acquaintances" are seldom the companions of study, or the auxiliaries of business, but most generally the associates of a debauch, the fellow-flutterers upon the Mall, the companion-hounds in the chase of empty pleasure. It is amazing how much a youth can endure of the company of his principal "acquaintance." Virgil's expression, "*tecum consumere ævo*," is realised in his case; for he veritably appears as if he could spend his whole life in the society of the treasured individual. At the approach of that person, every other matter is cast aside; the most important business seems nothing in contrast with the interchange of a smile or a jest with this duplicate of himself. The injunctions of the most valued relations—even of father and mother—are scattered to the winds, if they are at variance with the counsels or conduct of this precious person, whom, after all, he perhaps met only last week at a club. The power of an "acquaintance"

of this kind, for good or evil, over the mind of his friend, is so very great, that it may well give some concern to those who are really interested in the prospects of youth. But every effort to redeem a victim from the fascination will be in vain, unless his natural or habitual goodness be shocked by the further exposure of the "acquaintance's" character. The only safeguard, therefore, against this mighty evil, is *previously* to accustom youth to depend much upon themselves, and to endeavour to infuse into them a sufficient degree of moral excellence to be a protection to them against the worst vices which "acquaintances" may attempt to impart to them.

There is a possibility, however, that the "acquaintance" may be no worse than his fellow, and yet the two will do that together which they could not do singly. Virtue is, upon the whole, a thing of solitude: vice is a thing of the crowd. The individual will not dare to be wicked, for the responsibility, he knows, must be concentrated upon himself; while the company, feeling that a divided responsibility is hardly any responsibility at all, is under no such constraint. There is much edification to the heart of the thoughtless and wicked in the participation of companions; and even in large associations of honourable men for honourable purposes, there is often wanting that fine tone of feeling which governs the conduct of perhaps each individual in the fraternity. Thus, an excessive indulgence in the company of "acquaintances" is to be avoided, even where these "acquaintances" are not inferior in moral worth to ourselves. There is an easy kind of morality much in vogue among a great body of people, that "what others do we may do," as if higher standards had not been handed down by God himself from heaven, or constructed in the course of time by the wise and pure among men. This morality comes strongly into play among youth in their intercourse with contemporaries; and as it is always on rather a declining than an advancing scale, it soon leads them a great way down the paths of vice.

It will be found, in general, that a considerable degree of abstinence from this indulgence is required, even to secure the most ordinary degree of success in life. But if great things be aimed at, if we wish to surpass our fellows by many degrees, and to render ourselves honourably conspicuous among men, we must abjure "acquaintances" almost entirely. We must, for that purpose, withdraw ourselves from all temptation to idle and futile amusement—we must, in the words of a great poet, "shun delights, and live laborious days."

PRIVATE LIFE OF JAMES IV. OF SCOTLAND.

MR PITCAIRN, in some of the late volumes of his "Criminal Trials," has supplied us with a few occasional extracts from the accounts of the Lord High Treasurer of Scotland, which perhaps cast a stronger and steadier light upon the times to which they refer, than any historical documents hitherto published. These accounts, which are to be found in tolerable preservation in the General Register House, form simply a current record of the personal expenses of the king; and we believe they commence so early as the time of Bruce, and do not close till Scotland ceased to have a distinct court. Previous to the publication of Mr Pitcairn's truly valuable work, hardly any extracts from this immense mine of curious detail had ever reached the public; and few even of the "antiquarian trade" had ventured to grapple with the original volumes. Our curiosity having been greatly excited by Mr Pitcairn's extracts, which chiefly refer

to the reign of James IV., we have sought and obtained possession of a still more extensive (manuscript) series of selections relating to that era, from which we hope to supply some amusement and information to our readers.

The first idea which strikes one who dips into these accounts, is the amazing difference between all his preconceived notions of the court of James IV., and what is to be derived from this record. If the inquirer has only read Marmion, and supposes James to have been a purely noble and gallant being, whose fittest office it was to lean over a lady's chair while she sung to her lute, his dream will be effectually broken by a perusal of the treasurer's books. The effect, in short, which these memorabilia have upon the mind, is, as it were, to break down the picture previously painted by history and poetry into its elements, and to show it up as only so much coarse thread, woven into a piece of canvass, and plastered over with a certain quantity of oil and coloured earth. The homely court of poor old Scotland is here shown in its real colours, and every atom of its composition estimated at no more than its exact value in Scots money. My Lord Treasurer was in truth no painter—no searcher after fine and tricky phrases; he tells his story in his own broad vernacular, and, we verily believe, does not cheat either his master or posterity of a single farthing.

The reign of James IV. commenced on the 18th of June 1483, when he was only sixteen years of age, and terminated with his death at Flodden, on the 13th of September 1512. It is needless to enter into any disquisition respecting either his personal history or that of his country, for our object is only to afford such light upon these points as is supplied by the curious record before us.

First, as to the AMUSEMENTS of the king. Previous to the general diffusion of literature, and the commencement of the great division of opinion upon religious and political subjects, which, since the Reformation till the present time, has kept the minds of men constantly upon the *qui vive*, the chief resource for pastime seems to have been in practical sports, in listening to jesters and minstrels, and in attending homely plays and masquerades. In those simple days, men had neither newspapers nor novels; religion was a settled thing, demanding implicit faith and a routine of monotonous observances, but permitting no discussion; neither did the question of liberal or illiberal government divide men into two great debating parties. When not engaged in actual war, the superior classes indulged in its semblances—the tourney or the chase; or they planted the wandering minstrel in the midst of their circle, and held their breath while he recounted the feats of the mighty of old; or they lolled over gaming boards, perhaps fixed in the bottoms of their windows—a specimen of which is still to be seen in Craigmillar Castle; or they "daffed" away the time in less rational indulgences over the social board, where the coarsest jest and the broadest allusion was ever most favourably received. Hence a modern reader is apt to be astonished at the multitudinous expenses of King James on the score of amusements, of which we shall proceed to give some details.

The chief out-of-door sports of the king seem to have been the tournament, hunting the deer, hawking, archery, "the cache," and playing at bowls. His principal in-door sports were playing at "the tables," cards, and dice. On all these subjects the entries in the treasurer's books are very numerous and frequent; we shall only, however, give such as appear to us to be curious, or which refer to practices not

now familiar. "May 10, 1496—to the king, in Strivilin, to play at the cache," six pounds ten shillings. This is a game to which we have seen various allusions in documents of the fifteenth century. It seems to be the same with the ordinary sport of the ball, as now played by boys against a dead wall, and which in Scotland is still called the *cache-ball*. On the day succeeding the above entry, is one of twenty-four shillings, "to the king, to play at the bilis [bowls] at Drummond." On the 7th of June is an entry showing the possibility of very deep play at the *cache*: "To Wat of Lesly, that he wan at the cache fra the king," twenty-three pounds eight shillings! On the single night of Christmas 1496, there are given to the king at Melrose, to spend at cards, "thirty-five unicornis, eleven French crowns, a ducat, a ridare, and a lew"—in all, forty-two pounds. "April 17, 1497—giffen to the king, that he tynt at the buttis in Strivilin, vijs." This refers to archery, the butts being two mounds, at a proper distance from each other, whereupon the marks were set. On the 24th of July 1504, there is an entry of fifty-six shillings, "to George Campbell, gardiner in Strivilin, to big the bow-buttis in Strivilin, furth of the garding beside the stable." April 22, 1497—"two shillings paid for foot-balls to the king;" and, "January 2, 1504—that samyne nycht, in Samuelstone, to the king, to play at the tables with the laird, three French crowns." Throughout the whole of the winter period, there are entries almost every night for sums lost at the cards or the tables; for the king, with true royal feeling, seems to have thought it beneath him ever to win. In the summer, we find as frequent allusions to his hawks and hounds, to his bows and arrows, and his armour and jousting spears.

In the department of miscellaneous amusements, we find matters still more curiously illustrative of the manners of the age. On the 5th of August 1488, within six or seven weeks of the barbarous death of his father, through a rebellion in which he was himself (it is said, innocently) concerned, the king is found giving five pounds at Linlithgow "to Patrick Johnston and the players that play to the king." The same company played a twelvemonth after at the same place for the entertainment of a Spanish embassy, and received eight pounds eight shillings. Wherever he goes, the king seems to have been entertained by "dansaris and gysaris," who were probably connected with the particular place where they exhibited. For instance, January 5, 1504, he gives eight French crowns to "the gysaris of the toune of Edinburgh;" and, August 20, 1488, being at a justice-ayre at Larnark, he gives six-and-thirty shillings "to dansaris and gysaris." On another occasion, he gives a like sum to "the dansaris and gysaris" at Arbroath. The "dansaris" were no doubt morrice-dancers, for, on the 31st December 1506, there is an entry of four pounds twelve shillings to Thomas Boswell, "for xxx. dosane of *bellis* for dansaris." "Gysaris," and "dansaris," and "playaris," appear to have been in some measure synonymous, as on "Sanct Johnnis day, 1491," a sum is given to "gysaris that dansit to the king," in Linlithgow; and on the 13th of August 1503, thirty French crowns are given to the "gysaris that playit the play." Perhaps one of the most curious entries on this score, is one on the 16th of July 1491, "to the Spanyearthis that dansyt before the king on the cawsey of Edinburgh, before the thesauraris lweing, xxx. unicornis," equal to twenty-seven pounds. A relic of this profession has come down to our own day.

Music was another of the king's favourite amusements, as it was also one of his own accomplishments. "Dec. 6, 1497—to John Jamesone for a lute to the king, 6s. 8d." "July 8, 1504—for a lute and a pair of monocords brocht hame to the king be William Brownhill, quhilk cost in Flanders 45s." These and similar entries show his own propensity for music, and the kind of instruments upon which he performed. He retained about his person a vast multitude of "lutaris," "piparis," "fithelaris" (fiddlers), "clarschaaris" (Highland harpers), "tabrounaris," "trumpetaris," "schawmeris," &c., to all of whom occasional entries are made, for ordinary pay and presents. Many of these humble children of Euterpe were natives of other countries; many from Ireland and the Highlands. July 10, 1489, eight pounds eight shillings are paid "to Inglis (English) pyparis that came to the castell and playit to the king." On the 26th of August 1504, four French crowns are given "to Cuddy the Inglis luter, to louse his cheyne of grotis, quhilk he tint at the cartis" (to relieve his chain of grotis, which he lost at cards). The king also had an English jester, styled variously "Jolly Johne, the fule of Englande," and "Gentil Johne, the Englishe fule," to whom numerous sums are given. Of "menstralis," who joined the professions of music and poetry, James entertained no fewer than thirty-one at his own court, while to those who were local to the particular towns he visited, he was invariably generous. Blind Harry, the minstrel, to whom we are indebted for the well-known popular poem of WALLACE, was a regular *attaché* of the court, and appears to have received eighteen shillings every three months, as a pension. On the 27th of April 1490, one of these sums is entered for Blind Harry; and as five shillings are given on the same day to "the cobill man of Cambuskenneth quhen the king past owre" (the Forth), we are entitled to assume that the guerdon in this particular instance was extended almost on the very

scene of Wallace's chief victory, the battle of Stirling Bridge. James is also very bountiful to bards of higher standing; for instance, Dunbar is found in the constant receipt of £20 a-year. It is assumed by the modern poet Beattie, upon the credit, we believe, of Percy, that "the north cuntries" was the proper nativity of minstrels; but how does this consort with the repeated mention in these accounts of "menstralis" from England and the southern states of Europe! "November 21, 1504—to one of the four *Italiene* menstralis, to by him ane hat, by the king's command, xliijs." "1512-13, February 15—Item, to Guileame, organer, Frenchman, and his five complices, French menstralis, xxvi, vs." Another of James's minstrels is called Dominico, which looks amazingly little like a hyperborean name. There seems to have been a great confusion in the duties of minstrels. The character was nearly allied to buffoonery and mere story-telling; and hence we are the less to wonder at the apparently barbarous edicts of those days, which denounce the profession of poesy as rank vagrancy. Jesters, minstrels, and dancers, are all classed in one servile enumeration, and all occasionally receive the same allowances for *livery*.

In the department of "singing," we have a curious entry, which appears to have taken place on the festival still observed in Scotland under the name of Handsel Monday. "1491—on Monunda the ij. of Januar, to Sir Thomas Galbreth, Jok Goldsmyt, and Crafurde, for the singyn of a ballat to the king in the morning, iij. unicornis," equal to two pounds fourteen shillings. Two years before, there is an entry of ten pounds "to Wilyeam Sangster of Lithquo, for a sang-buke he brocht to the king;" and almost at the same time we find given "to Cunnyngame the singar, at the kingis commande, a demy," i. e. fourteen shillings. "1496, May 23—Item, that saym nicht to ij. women that sang to the king in Strivilin, xliijs." And such entries are frequent. In the department of jesting and story-telling, we have, "April 5, 1491—to Wallace that tells the geistis," eighteen shillings; "January 22, 1507-8—Item, to ane jester, be the kingis comand," five shillings. It is a circumstance not unworthy, perhaps, of being noted, that an ancestor of the biographer of Samuel Johnson—the prince of modern literary gossips—was a conspicuous figure in the train devoted to the amusement of the Scottish monarch. Thomas Boswell, a cadet of the old house of Balmonto, and who was finally rewarded for his services by a grant of the estate of Auchinleck, is entered on one occasion, already touched upon, for the receipt of money to purchase bells to thirty dancers. On another occasion, he receives a sum to purchase dancing attire for himself. We suspect that he held an office in the court of King James, not very different from that held by his descendant in the court of King Samuel. On the 2d of August 1504, is an entry of twenty-eight shillings, given to "James Hog, the tale-teller, to fee two hors in Eskdale, with the kingis harness." Perhaps we have here another instance of collusive character and profession in remote relations.

James IV. was infected with the absurdities of alchemy. Accordingly, on the 11th day of February 1503-4, we find twenty shillings of sound money given away "to the man suld mak *aurum potable*, be the kingis commands." But the good monarch had a still stranger craze than this: he was an amateur surgeon, and seems, in that character, to have been a somewhat formidable person among his courtiers. "April 10, 1510—Item, to the blind wyf that hed her eyne schorne [i. e. we suppose, couched for the cataract], xlijs." The phrase, as Mr Pitcairn remarks, is most ominous of "evil success." It would almost appear that the king was willing to pay poor people for liberty to operate upon them. "1511-12, February 9—Item, to ane fallow becaus the king pulit furth his tooth, xlijs." "February 25—Item, to Kynnard, the barbour, for two teith drawin furth of his heid be the king, xlijs." On another occasion, his foreign minstrel Dominico receives eighteen shillings, "to gyf the king leve to lat him bluid." We may suppose that when the king puts a bounty upon the toothache, the malady will be apt to become popular.

SCOTTISH NATIONAL INSTITUTIONS.

THE LAW OF SCOTLAND.

THE foundation upon which the superstructure of our law is reared, is a very ancient work entitled the "*Regiam Majestatem*." Almost no point in history has been so warmly canvassed as the authorship of this production; one party asserting it to be a compilation dictated by David I. of Scotland, and another, with equal feasibility, declaring it to be a work digested by order of Edward I. of England, and introduced by him into this country for the purpose of assimilating the Scotch with the English law. Leaving this to be cleared up by the researches of historians, it may be mentioned, that whether Edward was the patron of the *Regiam* or not, it is at least very certain, that, on conquering the northern part of the island, he was anxious to engraft upon it the institutions of his own kingdom. While he and his successor were in Scotland, the Court of King's Bench sat at Roxburgh, where cases were determined on equal terms from all parts of Britain.

This remarkable compilation of laws was the only written law of the kingdom, until James I. attempted to superadd the enactments of Parliament, and intro-

duce the civilised usages of the English government. The acts of the Scottish Parliament were for several ages of little force in a country so turbulent as Scotland; but at length, as the people became more civilised, they came into complete operation. Though these statutes were ultimately the cause of dispossessing the *Regiam*, that work was not neglected. The new laws were constituted on the model therein presented; and thus the principles of the Roman, and the other legal usages of a foreign character, have formed the basis on which almost all our municipal laws are founded.

Before proceeding farther, it may be of use to say a few words in reference to the Roman law, as developed in the Justinian code. "The emperor Justinian, who flourished in the year 533, having (says Bankton, a Scottish lawyer) by his great victories restored to the Roman empire the several vast provinces which had been dismembered from it in the times of his predecessors, by the Goths, Vandals, and other foreign nations, and enjoying perfect tranquillity, undertook the noble but difficult enterprise of reducing their laws to order, which, by their immense bulk, had fallen into great confusion; and, in the first place, he caused compile the code, consisting of the constitutions of the emperors from Adrian's time till his own, collected out of the Gregorian, Hermogenian, and Theodosian codes. Next, he caused digest what was proper to have the sanction of laws of the writings of the Roman lawyers, that flourished either in times of the commonwealth, or under the emperors till the emperor Gordian, under whom Modestinus, the last of those illustrious lawyers, lived. These consisted of no less than two thousand volumes, all which were perused by the learned persons commissioned for that purpose, who excerpted such portions as they thought fit for the design, and composed them into fifty books, called the *Pandects* and *Digests*, which the emperor authorised for laws, and advised the same to be published. And the very same year he advised the Institutions, as the elements of the civil law, to be composed; these are contained in four books, to which he likewise gave the imperial sanction. He afterwards added new laws or Novels; and the whole being joined together, the greatest magazine of knowledge was thus formed that ever the world was favoured with.

These *Pandects* or written laws were lost for many centuries after the overthrow of the empire by the barbarians, and they were not discovered till the year 1137, before which time the whole of the nations of Europe were lying in the lowest pitch of degradation. A copy which had escaped the general destruction of Roman literature, it is said, was discovered accidentally in the town of Amalfi in Italy; and no sooner was the fact promulgated, than the Romish ecclesiastics addressed themselves warmly to the task of disseminating its contents throughout the different states in which they happened to be. The original copy of the *Pandects* was deposited at Florence, 1411, where, says Brenckman, an enthusiastic Dutch lawyer, who undertook a pilgrimage to study one of the manuscripts, has left a learned work on the subject; it is esteemed as the most valuable literary curiosity in existence, being preserved in purple velvet in a rich casket, and shown to travellers by the monks and magistrates bareheaded, and with lighted tapers. Modern tourists are silent respecting the present condition of the *Pandects*, but we believe they are lodged among other rare books and manuscripts in the Florentine library of Magliabechina. The lawyers of Holland have written many ponderous volumes of commentaries on the Roman law, and to these monuments of learning and industry Scottish advocates frequently find occasion to refer in their papers and pleadings. There have been several splendid editions of the *Pandects*; that commonly used is from the Dutch press, and resembles a thick octavo Bible closely printed in double columns. The word *Pandect* signifies all the words, or all the sayings.

Our lawyers now divide the common law into two departments—the written law, or that part of our jurisprudence derived from Scottish and British statutes; and the unwritten or consuetudinary law, founded on customs and usages of great antiquity, and only known by the writings of modern authors. To these there might be added a third or minor branch, composed of acts of sederunt of the Court of Session, a judicature possessing very extensive powers in the interpretation of old statutes, in the regulation of its own forms, and in the enactment of a species of by-laws, not infringing on British acts of Parliament, but calculated to supply what may have been left unprovided for in the written or unwritten law. In the exercise of a discretionary power of this description, the Court of Session generally acts with very commendable prudence; and it is fortunate for the liberties of the subject that such is the case. The old written law, or acts of the Scottish Estates, are often very tyrannical, and at least vexatious; and as there is no precise summary of abrogated and unabrogated enactments, it becomes thence the prerogative of the supreme judicatures to apply them as appears most consonant with justice and humanity.

Much of the indistinctness of the civil and criminal jurisprudence of Scotland, arising from the circumstance above quoted, has been obviated by compilations of legal institutes. The works of Mackenzie, Erskine, Stair, Hume, Bell, and other writers on the principles and forms of law, with the decisions of the courts on all kinds of cases, have considerably simplified the judicial code, and, in defiance of the apocryphal acts,

have rendered it more explicit and intelligible than that of England. Except as regards cases bearing principally on mercantile law, which is only beginning to be forced on the attention of Scottish lawyers, it apparently suits every purpose required, to the complete satisfaction of the nation. Sometimes it is severe, but more ordinarily it is temperate, and generally mild and equitable. Considering the vicissitudes through which it has come, and the prejudices of many of its constructors, it is in reality a matter of surprise how it should be so steady, efficient, and humane. Now when modified and improved by British statutes, it requires only to be administered by active and prudent judges, to be every way worthy of permanent support. Beneficial as the progressive introduction of English institutions may be, any molestation of the common law, the *lex loci*, in favour of parallel usages from England (until these usages have been primarily purified), would be a serious error in international government. Should the legislature ever contemplate the abrogation of such an important national institution, it is desirable that, in the first place, our jurisprudence be patiently studied; and if a reciprocity of laws be ultimately found expedient, that the Scotch may at least have the gratification of contributing their due proportion to the imperial code.

AN IRISH STORY.

By the Author of "Tales of the O'Hara Family."

THE faults of the lower orders of the Irish are sufficiently well known: perhaps their virtues have not been proportionately observed, or recorded for observation. In this view the following story is written:—

The Irish plague called typhus fever raged in its terrors. In almost every third cabin there was a corpse daily. In every one, without an exception, there was what had made the corpse—hunger. It need not be added that there was poverty too. The poor could not bury their dead. From mixed motives of self protection, terror, and benevolence, those in easier circumstances exerted themselves to administer relief in different ways. Money was subscribed; wholesome food was provided; and men of respectability, bracing their minds to avert the danger that threatened themselves, by boldly facing it, entered the infected house, where death reigned almost alone, and took measures to cleanse and purify the close-cribbed air, and the rough bare walls. Before proceeding to our story, let us be permitted to mention some general marks of Irish virtue which, under those circumstances, we personally noticed.

In the early progress of the fever, before the more affluent roused themselves to avert its career, let us cross the threshold of an individual peasant. His young wife lies dead; his second child is dying at her side; he has just sunk into a corner himself, under the first stun of disease, long resisted. The only persons of his family who have escaped contagion, and are likely to escape it, are his old father, who sits weeping feebly upon the hob, and his first-born, a boy of three or four years, who standing between the old man's knees cries also for food.

We visit the young peasant's abode some time after. He has not sunk under "the sickness." He is fast regaining his strength, even without proper nourishment; he can creep out of doors, and sit in the sun. But, in the expression of his sallow and emaciated face, there is no joy for his escape from the grave, as he sits there alone, silent and brooding. His father and his surviving child are still hungry—more hungry, indeed, and more helpless than ever; for the neighbours who had relieved the family with a potato and a mug of sour milk, are now stricken down themselves, and want assistance to a much greater extent than they can give it. "I wish Mr Evans was in the place," cogitated Michael Carroll; but another fortnight elapsed, and Michael's hope proved vain. Mr Evans was still in London. Though a regular resident on his small Irish estate since it had come into his possession, business unfortunately—and he would have said so himself—now kept him an unusually long time absent. Thus disappointed, Michael overcame his repugnance to appear before the "hard steward." He only asked for work, however. There was none to be had. He turned his slow and still feeble foot into the adjacent town. It was market-day, and he took up his place among a crowd of other claimants for agricultural employment, shouldering a spade, as did each of his companions. Many farmers came to the well-known "stannin," and hired men at his right and at his left, but no one addressed Michael. Once or twice, indeed, touched perhaps by his sallow looks of beseeching misery, a farmer stooped a moment before him, and glanced over his figure: but his worn and almost shaking limbs giving little promise of present vigour in the working field, worldly prudence soon conquered the humane feeling which started up towards him in the man's heart, and, with a choking in his throat, poor Michael saw the arbiter of his fate pass on.

He walked homeward, without having broken his fast that day. "Bud, *musha*, what's the harm o' that?" he said to himself; "only here's the old father an' her pet boy, the weenock, without a pyatee either. Well, *ashore*, if they can't have the pyatees, they must have better food—that's all;—ay—" he muttered, clenching his hands at his sides, and imprecating fearfully in Irish—"an' so they must."

He left his house again, and walked a good way to

beg a few potatoes. He did not come back quite empty handed. His father and his child had a meal. He ate but a few himself; and when he was about to lie down in his corner for the night, he said to the old man, across the room, "Don't be a-crying to-night, father—you and the child there; bud sleep well, and ye'll have the good break'ast afore ye in the mornin'."

"The good break'ast, my boy; a-then an' where 'ill id come from?" "A body promised it to me, father." "*Avich!* Michael; an' sure its fun you're making of us now at any rate. Bud, the good night, an' my blessin' on your head, Michael; an' if we keep trust in the good God, an' ax his blessin' too, mornin' an' evenin', gettin' up an' lyin' down, He'll be a friend to us at last."

Having thus spoken in the fervent and rather exaggerated, though every-day, words of pious allusion of the Irish poor man, old Carroll soon dropt asleep, with his arms round his little grandson, both overcome by an unusually abundant meal. In the middle of the night he was awakened by a stealthy noise. Without moving, he cast his eyes round the cabin. A small window, through which the moon broke brilliantly, was open. He called to his son, but received no answer. He called again and again; all remained silent. He arose, and crept to the corner where Michael had lain down. It was empty. He looked out through the window into the moonlight. The figure of a man appeared at a distance, just about to enter a pasture-field belonging to Mr Evans.

The old man leaned his back against the wall of the cabin, trembling with sudden and terrible misgivings. With him, the language of virtue, which we have heard him utter, was not cant. In early prosperity, in subsequent misfortunes, and in his late and present excess of wretchedness, he had never swerved in practice from the spirit of his own exhortations to honesty before men, and love for and dependence upon God, which, as he has truly said, he had constantly addressed to his son since his earliest childhood. And hitherto that son had indeed walked by his precepts, further assisted by a regular observance of the duties of his religion. Was he now about to turn into another path? to bring shame on his father in his old age? to put a stain on their family and their name—"the name that a rogue or a bould woman never bore," continued old Carroll, indulging in some of the pride and egotism for which an Irish peasant is, under his circumstances, remarkable. And then came the thought of the personal peril incurred by Michael; and his agitation, incurred by the feebleness of age, nearly overpowered him.

He was sitting on the floor, snivelling like one in an ague-fit, when he heard steps outside the house. He listened, and they ceased; but the familiar noise of an old barn-door creaking on its crazy hinges, came on his ear. It was now day-dawn. He dressed himself; stole out cautiously; peeped into the barn through a chink of the door, and all he had feared met full confirmation. There, indeed, sat Michael, busily and earnestly engaged, with a frowning brow and a haggard face, in quattering the animal he had stolen from Mr Evans's field. The sight sickened the father—the blood on his son's hands, and all. He was barely able to keep himself from falling. A fear if not a dislike of the unhappy culprit also came upon him. His unconscious impulse was to re-enter their cabin unperceived, without speaking a word; he succeeded in doing so; and then he fastened the door again, and undressed, and resumed his place beside his innocent little grandson. About an hour afterwards, Michael came in cautiously through the still open window, and also undressed and reclined on his straw, after glancing towards his father's bed, who pretended to be asleep. At the usual time for rising, old Carroll saw him suddenly jump up, and prepare to go abroad. He spoke to him, leaning on his elbow.

"And what are you about?" "Going for the good break'ast I promised you, father dear." "An' who's the good Christin 'ill give id to us, Michael?" "Oh, you'll know that soon, father: now, a good bye;" he hurried to the door. "A good bye, then, Michael; bud, tell me, what's that on your hand?"

"No—nothin'," stammered Michael, changing colour as he hastily examined the hand himself; "nothin' is on id; what could there be?" (nor was there, for he had very carefully removed all evidence of guilt from his person; and the father's question was asked upon grounds distinct from any thing he then saw. "Well, *avich*, an' sure I didn't say any thing was on it wrong, or any thing to make you look so quare, an' 'spake so strange to your father, this mornin' in'; only I'll ax you, Michael, over again, who has took such a sudden likin' to us, to send us the good break'ast? an' answer me straight, Michael—what is id to be, that you call it so good?")

"The good mate, father;" he was again passing the threshold. "Stop!" cried his father, "stop, an' turn forment me. Mate?—the good mate? What 'ud bring mate into our poor house, Michael? Tell me, I bid you again an' again, who is to give id to you?" "Why, as I said afore, father, a body that —"

"A body that thieved id, Michael Carroll!" added the old man, as his son hesitated, walking close up to the culprit; "a body that thieved id, an' no other body. Don't think to blind me, Michael. I am old, to be sure; but sense enough is left in me to look round among the neighbours, in my own mind,

an' know that none of 'em that has the will, has the power to send us the mate for our break'ast, in an honest way. An' I don't say outright that you had the same thought wid me, when you consented to take it from a thief—I don't mean to say that you'd go to turn a thief's receiver at this hour o' your life, an' after growin' up from a boy to a man widout bringin' a spot o' shame on yourself, or on your weenock, or on one of us. No; I won't say that. Your heart was scalded, Michael, an' your mind was darkened, for a start; an' the thought o' gettin' comfort for the old father, an' for the little son, made you consent in a hurry, widout lookin' well afore you, or widout lookin' up to your good God."

"Father, father, let me alone!—don't spake them words to me," interrupted Michael, sitting on a stool, and spreading his large and hard hands over his face.

"Well, thin, an' I won't, *avich*; I won't; nothin' to trouble you, sure; I didn't mean id; only this *avourneen*, don't bring a mouthful o' the bad, unlucky victuals into this cabin; the pyatees, the wild berries o' the bush, the wild roots o' the earth, will be sweeter to us, Michael; the hunger itself will be sweeter; an' when we give God thanks afther our poor meal, or afther no meal at all, our hearts will be lighter, and our hopes for to-morrow stronger, *avich-ma-chree*, than if we fasted on the fat o' the land, but couldn't ax a blessin' on our fast."

"Well, thin, I won't, either, father, I won't; an' sure you have your way now. I'll only go out a little while from you—to beg; or else, as you say, to root down in the ground, with my nails, like a baste-brute, for our break'ast."

"But you know, Michael, there would be danger in quittin' the place widout hiding well every scrap of any thing that could tell on us."

"Tell on us! What can tell on us?" demanded Michael; "what's in the place to tell on us?" "Nothin' in the cabin, I know, Michael; but —"

"But what, father?" "Have you left nothin' in the way, out there?" whispered the old man, pointing towards the barn. "Out there! Where? What—what do you mean at all now, father? Sure you know it's your ownself has kept me from as much as laying a hand on it." "Ay, to-day-mornin'; bud you laid a hand on it last night, *avich*, an' so —" "*Curp-an-duoul!*" imprecated Michael, "this is too bad, at any rate; no I didn't—last night, or any other night—let me alone, I bid you, father." "Come back again, Michael," commanded old Carroll, as his son once more hurried to the door; and his words were instantly obeyed. Michael, after a glance abroad, and a start which the old man did not notice, paced to the middle of the floor, hanging his head, and saying in a low voice, "Hushth now, father—it's time."

"No, Michael, I will not hushth; an' it is not time; come out with me to the barn."

"Hushth!" repeated Michael, whispering sharply; he had glanced sideways to the square patch of strong morning sunlight on the ground of the cabin, defined there by the shape of the open door, and saw it intruded upon by the shadow of a man's bust leaning forward in an earnest posture.

"Is id in your mind to go back into your sin, Michael, an' tell me you were not in the barn, at day-break, this mornin'?" asked his father, still unconscious of a reason for silence.

"Arrah, hushth, ould man!" Michael made a hasty sign towards the door, but was disregarded—"I saw you in id," pursued old Carroll, sternly; "ay and at your work in id, too." "What's that you're sayin', ould Peery Carroll?" demanded a well-known voice. "Enough—to hang his son," whispered Michael to his father, as Mr Evans's land-steward, followed by his herdsman and two policemen, entered the cabin. In a few minutes afterwards, the policemen had in charge the dismembered carcass of the sheep, dug out of the floor of the barn, and were escorting Michael, handcuffed, to the county jail, in the vicinity of the next town. They could find no trace of the animal's skin, though they sought attentively for it; and this seemed to disappoint them and the steward a good deal.

From the moment that they entered the cabin, till their departure, old Carroll did not speak a word. Without knowing it, as it seemed, he sat down on his straw bed, and remained staring stupidly around him, or at one or other of his visitors. When Michael was about to leave the wretched abode, he paced quickly towards his father, and holding out his ironed hands, and turning his cheek for a kiss, said smiling miserably, "God be wid you, father dear." Still the old man was silent, and the prisoner and all his attendants passed out on the road. But it was then the agony of old Carroll assumed a distinctness. Uttering a fearful cry, he snatched up his still sleeping little grandson, ran with the boy in his arms till he overtook Michael; and, kneeling down before him in the dust, said, "I ax pardon o' you, *avich*—won't you tell me I have id afore you go? an' here I've brought little Peery for you to kiss; you forgot him, *avourneen*."

"No, father, I didn't," answered Michael, as he stooped to kiss the child; "an' get up, father, get up; my hands are not my own, or I wouldn't let you do that afore your son. Get up, there's nothin' for you to trouble yourself about; that is, I mean, I have nothin' to forgive you: no, but every thing to be thankful for, an' to love you for; you were always an' ever the good father to me; an' —" The many strong

and bitter feelings which till now he had almost perfectly kept in, found full vent, and poor Michael could not go on. The parting from his father, however, so different from what it had promised to be, comforted him. The old man held him in his arms, and wept on his neck. They were separated with difficulty.

Peery Carroll, sitting on the road-side after he lost sight of the prisoner, and holding his screaming grandson on his knees, thought the cup of his trials was full. By this imprudence he had fixed the proof of guilt on his own child; that reflection was enough for him, and he could indulge it only generally. But he was yet to conceive distinctly in what dilemma he had involved himself as well as Michael. The policemen came back to compel his appearance before the magistrate; and when the little child had been disposed of in a neighbouring cabin, he understood, to his consternation and horror, that he was to be the chief witness against the sheep-stealer. Mr Evans's steward knew well the meaning of the words he had overheard him say in the cabin, and that, if compelled to swear all he was aware of, no doubt would exist of the criminality of Michael, in the eyes of a jury. "Tis a strange thing to ax a father to do," muttered Peery, more than once, as he proceeded to the magistrates; "it's a very strange thing."

The magistrate proved to be a humane man. Notwithstanding the zeal of the steward and the policemen, he committed Michael for trial, without continuing to press the hesitating and bewildered old Peery into any detailed evidence; his nature seemed to rise against the task, and he said to the steward, "I have enough of facts for making out a committal; if you think the father will be necessary on the trial, subpoena him."

The steward objected that Peery would abscond, and demanded to have him bound over to prosecute, on two sureties, solvent and respectable. The magistrate assented; Peery could name no bail; and consequently he also was marched to prison, though prohibited from holding intercourse with Michael.

The assizes soon came on. Michael was arraigned; and, during his plea of "not guilty," his father appeared, unseen by him, in the jailor's custody, at the back of the dock, or rather in an inner dock. The trial excited a keen and painful interest in the court, the bar, the jury-box, and the crowds of spectators. It was universally known that a son had stolen a sheep, partly to feed a starving father; and that out of the mouth of that father it was now sought to condemn him. "What will the old man do?" was the general question which ran through the assembly: and while few of the lower orders could contemplate the possibility of his swearing to the truth, many of their betters scarce hesitated to make out for him a case of natural necessity to swear falsely.

The trial began. The first witness, the herdsman, proved the loss of the sheep, and the finding the dismembered carcass in the old barn. The policemen and the steward followed to the same effect, and the latter added the allusions which he had heard the father make to the son, upon the morning of the arrest of the latter. The steward went down from the table. There was a pause and complete silence, which the attorney for the prosecution broke by saying to the crier, deliberately, "Call Peery Carroll." "Here, sir," immediately answered Peery, as the jailor led him by a side-door out of the back dock to the table. The prisoner started round; but the new witness against him had passed for an instant into the crowd. The next instant, old Peery was seen ascending the table, assisted by the jailor, and by many other commiserating hands near him. Every glance fixed on his face. The barristers looked wistfully up from their seats round the table; the judge put a glass to his eye, and seemed to study his features attentively. Among the audience there ran a low but expressive murmur of pity and interest. Though emaciated by confinement, anguish, and suspense, Peery's cheeks had a flush, and his weak blue eyes glittered. The half-gaping expression of his parched and haggard lips was miserable to see. And yet he did not tremble much, nor appear so confounded as upon the day of his visit to the magistrate.

The moment he stood upright on the table, he turned himself fully to the judge, without a glance towards the dock. "Sit down, poor man," said the judge. "Thanks to you, my lord, I will," answered Peery, "only, first, I'd ax you to let me kneel for a little start;" and he accordingly did kneel, and after bowing his head, and forming the sign of the cross on his forehead, he looked up and said, "My judge in heaven above, 'tis you I pray to keep me to my duty, afore my earthly judge this day;—amen;"—and then repeating the sign of the cross, he seated himself.

The examination of the witness commenced, and humanely proceeded as follows—(the counsel for the prosecution taking no notice of the superfluity of Peery's answers.)

"Do you know Michael, or Michael, Carroll, the prisoner at the bar?"

"Afore that night, sir, I believed I knew him well; every thought of his mind, every bit of the heart in his body; afore that night, no living cratur could throw a word at Michael Carroll, or say he ever forgot his father's renown, or his love of his good God;—an' sure the people are afther telling you by this time how it came about that night—an' you, my lord—an' ye, gentlemen—an' all good Christians that hear me;—here I am to help to hang him—my own boy, and my only one—but, for all that, gentlemen, ye ought to

think of it; 'twas for the weenock and the ould father that he done it;—indeed, indeed, we hadn't a pyatee in the place; an' the sickness was among us a start afore; it took the wife from him, and another baby; an' I'd had himself down a week or so beforehand; an' all that day he was looking for work, but couldn't get a hand's turn to do; an' that's the way it was; not a mouthful for me an' little Peery; an', more betoken, he grew sorry for id in the mornin', an' promised me not to touch a scrap of what was in the barn—ay, long afore the steward an' the peelers came on us—but was willin' to go among the neighbours an' beg our breakfast along wid myself, from door to door, sooner than touch it."

"It is my painful duty," resumed the barrister, when Peery would at length cease, "to ask you for closer information. You saw Michael Carroll in the barn that night?" "The Lord pity him and me—I did, sir." "Doing what?" "The sheep between his hands," answered Peery, dropping his head, and speaking almost inaudibly.

"I must still give you pain, I fear; stand up; take the crier's rod; and if you see Michael Carroll in court, lay it on his head."

"Och, musha, musha, sir, don't ax me to do that!" pleaded Peery, rising, wringing his hands.

"I am sorry to command you to do it, witness, but you must take the rod," answered the judge, bending his head close to his notes, to hide his own tears; and at the same time, many a veteran barrister rested his forehead on the edge of the table. In the body of the court were heard sobs. "Michael, avich! Michael, a-corra-ma-chree!" exclaimed Peery, when at length he took the rod.

"My father does what is right," answered Michael, in Irish. The judge immediately asked to have his words translated; and when he learned their import, regarded the prisoner with satisfaction. "We rest here, my lord," said the counsel, with the air of a man freed from a painful task. The judge instantly turned to the jury box.

"Gentlemen of the jury—That the prisoner at the bar stole the sheep in question, there can be no shade of moral doubt. But you have a very peculiar case to consider. A son steals a sheep that his own famishing father and his own famishing son may have food. His aged parent is compelled to give evidence against him here for the act. The old man virtuously tells the truth, and the whole truth, before you and me. He sacrifices his natural feelings—and we have seen that they are lively—to his honesty, and to his religious sense of the sacred obligations of an oath. Gentlemen, I will pause to observe, that the old man's conduct is strikingly exemplary, and even noble. It teaches all of us a lesson. Gentlemen, it is not within the province of a judge to censure the rigour of the proceedings which have sent him before us. But I venture to anticipate your pleasure that, notwithstanding all the evidence given, you will be enabled to acquit that old man's son, the prisoner at the bar. I have said there cannot be the shade of a moral doubt that he has stolen the sheep, and I repeat the words. But, gentlemen, there is a legal doubt, to the full benefit of which he is entitled. The sheep has not been identified. The herdsman could not venture to identify it (and it would have been strange if he could) from the dismembered limbs found in the barn. To his mark on its skin, indeed, he might have positively spoken; but no skin has been discovered. Therefore, according to the evidence, and you have sworn to decide by that alone, the prisoner is entitled to your acquittal. Possibly, now that the prosecutor sees the case in its full bearing, he may be pleased with this result."

While the jury, in evident satisfaction, prepared to return their verdict, Mr Evans, who had but a moment before returned home, entered the court, and becoming aware of the concluding words of the judge, expressed his sorrow aloud that the prosecution had ever been undertaken; that circumstances had kept him ignorant of it, though it had gone on in his name; and he begged leave to assure his lordship that it would be his future effort to keep Michael Carroll in his former path of honesty, by finding him honest and ample employment, and, as far as in him lay, to reward the virtue of the old father.

While Peery Carroll was laughing and crying in a breath, in the arms of his delivered son, a subscription, commenced by the bar, was mounting into a considerable sum for his advantage.—*Friendship's Offering*, 1831.

DR ALEXANDER MURRAY.

THE Editor has been favoured with the following additional anecdote by the Rev. William Strang, minister of one of the Relief congregations, Edinburgh, illustrative of the early destitute condition of the late Dr Alexander Murray, whose life was some weeks ago presented in the Journal. Mr Strang places the circumstance to which he alludes two years later than that recorded in the autobiography; but which is the more correct, is left to the judgment of those acquainted with Murray in his juvenile days. How the incident should have been omitted in the "Life of Murray," written by himself, it is impossible to conjecture.

"Some time, I think," says Mr Strang, "in the summer of 1796, I was taking a forenoon's ride for two or three miles beyond the village of Minigaff. In ascending a hilly part of the road, I dismounted, and leading my horse, the day being warm, my attention

was attracted by a ragged boy sitting upon the heath, reading. Being in no hurry, and impelled by curiosity, I drew near, and spoke to him. Observing a number of books lying around him, I lifted one, and, opening it, found it to be Virgil. I desired him to read the first Eclogue, and he did so, *ad aperturam libri*. I asked if he knew me; he said he did. I asked if he knew where I lived; he replied, Yes. I requested him to call on Friday night at six o'clock to tea. He came; but judge Mrs Strang's astonishment when Murray appeared, and announced his invitation. Having intentionally concealed the circumstance of our interview, she was horrified at the idea of my folly in requesting a beggar boy, barefooted, clothed in rags, of whom she had never heard, to drink tea. However, after a little explanation, she was satisfied, and he was entertained with a hearty welcome. When he tasted the tea, he said it was the first he had ever drank, and thought it smelt like new-mown hay. Having expressed a wish to see Blair's Lectures on Rhetoric, I told him I had lent it to a Mr Hume, but the moment he was done with it, it should be at his service. He put a manuscript into my hands, saying it contained poems he had written in the moors; and begged of me to procure a subscription for printing them, in order to purchase clothes. I desired him to leave them with me for two or three weeks; that if I found they were good, and fit for meeting the public eye, I should comply with his request; but if not, I should take care he should soon exhibit a more respectable appearance. For obvious reasons, the idea of publishing the poems was dropped; but Murray on his return was furnished with the means of appearing in a garb more suited to his future prospects. A few days after, accidentally meeting with the Rev. Garlies Matland, minister of the parish of Minigaff, and mentioning the circumstance of Murray's acquirements in Latin, Greek, and Hebrew, he sent for him to his house, examined him, and recommended him to Principal Baird, by whose instrumentality, as I was informed, he procured an university education."

BIOGRAPHIC SKETCHES.

BELZONI.

In the following sketch of the life of Belzoni, one of the most ingenious eastern travellers in recent times, the juvenile reader is presented with the instance of a man of good family, and naturally fine feelings, reduced by misfortunes to a state of destitution, and who, under these distressing circumstances, engaged in the meanest occupation for support, rather than forego his ambitious designs, or be a burden to those on whom he might probably have relied. An instance of this species of self-denial and humiliation, especially when occurring in the life of a person who afterwards emerged from obscurity, and raised himself to distinction, is the more valuable from its rarity, and should not pass unobserved either by the moralist, or by those who aspire to gain the esteem and respect of their fellow-creatures. It shows the absolute necessity for the youthful entrant into the world being ever ready and willing to accommodate himself to the most humble employment for subsistence, provided it be an honest one, rather than lean upon his, perhaps, already poor enough parents, or those friends and acquaintances, who, though wishing him well, have in all likelihood a sufficiency of distresses of their own; or what would be fully more criminal, gather the miserable means of personal gratification, by incurring debts they know well can never honourably be discharged. Throughout the toils of Belzoni, in adding to the stores of knowledge, by his researches amidst the ruins of empires in the East, he laboured under continual difficulties; but we ever find in him the same uprightness of disposition which characterised his outset in life. I give the memoir, as abridged by James Augustus St John, in his *Lives of Celebrated Travellers*, recently published by Messrs Colburn and Bentley, in their "National Library."

"This able and interesting traveller, descended from a respectable Roman family, was born at Padua, whither his relations had many years previously removed. Being designed by his parents for some monastic order, he was at a very early age sent to Rome, the original abode of his ancestors, where he received his education, and spent the greater part of his youth. Here the sciences would appear to have obtained a decided preference in his mind, over every other branch of study; particularly hydraulics, to which he owed the reputation which he afterwards acquired in the world, and a success which was by no means equal to his deserts. The invasion of Italy, and the capture of Rome by the French, disturbed the peaceful but insignificant plan of life which he had traced out for himself. Instead of a monk he became a traveller. Departing from Rome in the year 1800, he for some time wandered about the Continent, deriving his subsistence, as he himself observes, from his own knowledge and industry, and occasional remittances from his family, who, though by no means wealthy, seem to have been generously disposed to afford him a support, which he, in a short time, no less generously refused to accept. In the year 1803, he arrived in England, where he not long afterwards married. In this country he supported himself, as is well known, by performing, in public, feats of prodigious strength, and by scientific exhibitions; still, with a manly independence, preferring the gaining of a precarious subsistence by these means to the idea of draining the slender resources of his family, or of resorting to those more easy but less reputable sources of gain which too frequently employ the talents of foreigners in England. Having remained nine years in Great Britain, Belzoni conceived the desire of visiting the south of Europe; and, taking his wife along with him, travelled through Portugal, Spain and Malta. It seems to have been during this part of his travels that he learned, from what he considered unexceptionable authority, that his scientific knowledge might

be turned to good account in Egypt, where an hydraulic machine would be of the greatest utility in irrigating the fields, which want water only to make them produce at any season of the year.

He accordingly took his passage on board of some ship bound for Egypt, and arrived in the harbour of Alexandria on the 9th of June 1815. The plague, he was informed, was now in the city, but gradually decreasing in malignity. Though antiquities, as he observes, were not at that time his object, he could not refrain from visiting the Pyramids. He accordingly accompanied an English gentleman to the spot, where they passed the night, and long before dawn had ascended the summit of the highest pile, to behold the sun rise over the land of Egypt.

'The scene here,' says he, 'is majestic and grand, far beyond description; a mist over the plains of Egypt formed a veil, which ascended and vanished gradually as the sun rose, and unveiled to the view that beautiful land, once the site of Memphis. The distant view of the smaller pyramids on the south marked the extension of that vast capital; while the solemn, endless spectacle of the Desert, on the west, inspired us with reverence for the all-powerful Creator. The fertile lands on the north, with the serpentine course of the Nile, descending towards the sea; the rich appearance of Cairo, and its minarets, at the foot of the Mokatum mountain, on the east; the beautiful plain which extends from the Pyramids to that city; the Nile, which flows magnificently through the centre of the sacred valley; and the thick groves of palm-trees under our eyes, altogether formed a scene of which a very imperfect idea can be given by the most elaborate description.'

Belzoni found, upon calculation, that his finances would still enable him to ascend the Nile as far as Assouan, and was about to proceed up the country, when Burckhardt and Mr Sak, who had previously discussed the point together, determined upon the removal of the colossal head of young Memnon to England, for the purpose of being presented to the British Museum; and requested our traveller, as one of the fittest persons that could be thought of, to undertake the task.

In a letter addressed to the African Association, dated Cairo, February 20, 1817, he says, 'You will be pleased to hear that the colossal head from Thebes has at last, after many difficulties, safely arrived at Alexandria. Mr Belzoni, who offered himself to undertake this commission, has executed it with great spirit, intelligence, and perseverance. The head is now waiting at Alexandria for a proper conveyance to Malta. Mr Salt and myself have borne the expenses jointly; and the trouble of the undertaking has devolved upon Mr Belzoni, whose name I wish to be mentioned, if ever ours shall, on this occasion, because he was actuated by public spirit fully as much as ourselves.'

Few things are more interesting in themselves, or less captivating in description, than a search after antiquities. Belzoni, after visiting Hermonthis and Dendera, arrived at Thebes, which, from the time of Germanicus to the present moment, has excited the wonder and admiration of every traveller who has beheld it. 'It is absolutely impossible,' says Belzoni, 'to imagine the scene displayed, without seeing it. The most sublime ideas that can be formed from the most magnificent specimens of our present architecture, would give a very incorrect picture of these ruins; for such is the difference, not only in magnitude, but in form, proportion, and construction, that even the pencil can convey but a faint idea of the whole. It appeared to me like entering a city of giants, who, after a long conflict, were all destroyed, leaving the ruins of their various temples as the only proof of their existence.'

After a brief examination of these mighty ruins, he crossed to the western bank of the Nile, where, amid the vast remains of the Memnonium, was the colossal head which he was to remove. He found it, he says, near the remains of its body and chair, with its face upwards, and apparently smiling on him at the thought of being taken to England. The implements which he had brought from Cairo were sufficiently simple: fourteen poles, each of which was employed in making a sort of car to lay the bust on, four ropes of palm-leaves, and four rollers, without tackle of any sort. Their boat lying too far off to be used as a lodging every night, they established themselves in the Memnonium, where, as the traveller remarks, they were handsomely lodged in a small hut formed of stones. Mrs Belzoni seems in fact to have been as enterprising and romantic as her husband, and made no difficulty about the rudeness of their accommodation. Into a detail of his laborious exertions, or those of the Arabs, in conveying the head to the Nile, I do not think it necessary to enter; it will be sufficient to state that, after incredible toil and perseverance, it was at length brought to the edge of the stream on the 12th of August 1816.

This object being effected, he made an excursion to the sepulchral excavations in the mountain of Gornou, celebrated for the quantity of mummies which they contain. Into this vast labyrinth he entered with two Arabs and his interpreter; they were in search of a sarcophagus which was said to have been discovered by Drovetti—but, in roaming about amid the dreary passages, lost their way, which, without extraordinary good fortune, might have been the first step to losing their lives. In labouring to find a passage out, they came to a small aperture, through which the interpreter and one of the Arabs passed easily, but Belzoni, who was a very large man, found it too small. 'One of the Arabs, however, succeeded, as did my interpreter, and it was then agreed,' says he, 'that I and the other Arab should wait till their return. They proceeded evidently to a great distance, for the light disappeared, and only a murmuring sound from their voices could be distinguished as they went on. After a few moments I heard a loud noise, and the interpreter distinctly crying, 'O mon Dieu! O mon Dieu! je suis perdu!' after which a profound silence ensued. I asked my Arab whether he had ever been in that place; he replied 'Never.' I could not conceive what could have happened, and thought the best plan was to return to procure help from the other Arabs. Accordingly,

I told my man to show me the way out again; but, staring at me like an idiot, he said he did not know the road. I called repeatedly to the interpreter, but received no answer. I watched a long time, but no one returned, and my situation was no very pleasant one.'

At length, however, by dint of laborious perseverance, they issued into upper air; and as the sarcophagus which they had discovered could not at that moment be removed, our traveller conceived the design of making a small excursion into Nubia. Accordingly, he proceeded up the river to Assouan, where, after much altercation, he procured a fresh boat to carry him to the second cataract. He admired, in passing, the beautiful island of Phile, rich in the ruins of antiquity. On the next day, several natives, armed with spears and shields of crocodile skins, came in boats to attack them on the river; but observing them, Mrs Belzoni and all, to be armed with pistols, they very prudently retired. At Deir, the capital of Lower Nubia, our traveller purchased with a small looking-glass permission to continue his voyage. Previous to this, many of the people of the country had never enjoyed the gratification of contemplating the reflection of their own countenances, unless, like Polyphemus, they made a mirror of the glassy stream. On arriving at Ipsambul, he saw with amazement the great rock-temple discovered by Burckhardt. He immediately conceived the design of clearing away the sand which obstructed the entrance into the temple, and made the proposal to the villagers, promising, in order to excite them to the task, a present in money; but soon found that he had at length arrived in a region where money had ceased to be omnipotent. The people stared at his piasters as they would have stared at a letter in an unknown language, and inquired who would give them any thing for such small bits of metal as those. However, he by degrees succeeded in convincing them that money possessed over civilised men, and all who came within their influence, a mysterious power which they could not resist, and thus awakened in their souls the 'accursed thirst of gold.' This seemed at first to produce a good effect; but the love of money once excited, they knew not where to stop; and their avarice, which he had reckoned his best ally, soon exhausted his means, so that before he had half completed his undertaking, he was compelled to desist, and continue his voyage up the Nile to Ibrim and the first cataract.

Having gratified his curiosity with a glance at these celebrated spots, Belzoni returned to Assouan, and from thence proceeded to Thebes, where he immediately put in train the measures necessary for conveying down the river the Memnon's head, and various other antiquities. The obstacles which were thrown in his way by the obstinacy of the natives, and the intrigues of Drovetti, and other collectors of antiquities, were numerous, and highly disgraceful to their originators. Nevertheless, on the 17th of November 1816, he succeeded in placing the head on board of a boat, in which he set sail on the 21st for Cairo, where he arrived on the 15th of December, after a voyage of twenty-four days.

From Cairo, Belzoni proceeded with the bust down the Nile to Rosetta and Alexandria; from whence, after having placed his charge in the pasha's warehouses, he quickly returned, for the purpose of proceeding on a second voyage up the Nile. At Eraromoun, near Ashmounet, Belzoni obtained intelligence that two agents of M. Drovetti were hurrying on towards Thebes, in the hope of forestalling him in the purchase of antiquities, upon which he hired two asses, and, leaving Mr Beechey to come up slowly with the boat, hurried off by night. On reaching the ruins, after an incredibly fatiguing journey of five days, he found that, although the agents had not arrived, Mr Salt's neglect, in not paying the way with a handsome present, had so completely irritated the bey, that he had appropriated to the French ex-consul the very ground upon which Belzoni had commenced his excavations during his first journey.

The most interesting transaction, perhaps, in which our traveller was any where engaged, was his visit to the Necropolis of Thebes, in the mountain of Gornou. This is a track of about two miles in length at the foot of the Libyan ridge. Every part of these rocks is scooped out into a sepulchre, which, however close it may be to other sepulchral chambers, has rarely any interior communication with them. It is impossible, as Belzoni observes, to convey by description an adequate idea of these subterranean abodes and their inhabitants. No other sepulchres in the world resemble them; there are no excavations or mines that can be compared with those astonishing places, which, when once seen, for ever after haunt the imagination, like a glimpse of the regions beyond the grave. Few travellers see more of these catacombs than the exterior chambers, from which the dead have been removed. In the interior sepulchres the air is suffocating, and frequently causes fainting. The dust of decayed mummies, which is so fine that it quickly penetrates in vast quantities to the lungs, and causes a difficulty of respiration; the strong effluvia of decomposed bodies; the dark, dismal, lonesome nature of the place—every thing tends to discourage the intruder. Belzoni was not, however, to be deterred. In describing the difficulties which he here encountered, he observes, 'In some places there is not more than the vacancy of a foot left, which you must contrive to pass through in a creeping posture like a snail, on pointed and keen stones that cut like glass. After getting through these passages, some of them two or three hundred yards long, you generally find a more commodious place, perhaps high enough to sit. But what a place of rest! surrounded by bodies, by heaps of mummies in all directions, which, previous to my being accustomed to the sight, impressed me with horror. The blackness of the walls; the faint light given by the candles or torches for want of air; the different objects that surrounded me seeming to converse with each other; and the Arabs with the candles or torches in their hands, naked and covered with dust, themselves resembling living mummies, absolutely formed a scene that cannot be described. In such a situation I found myself several times, and often returned exhausted and fainting; till at last I became inured to it, and indifferent to what I suffered, except from the dust, which never failed to choke my throat and nose; and

though fortunately I am destitute of the sense of smelling, I could taste that the mummies were rather unpleasant to swallow. After the exertion of entering into such a place, through a passage of fifty, a hundred, three hundred, or six hundred yards, nearly overcome, I sought a resting-place, found one, and contrived to sit; but when my weight bore on the body of an Egyptian, it crushed like a band-box. I naturally had recourse to my hands to sustain my weight, but they found no better support; so that I sunk altogether among the broken mummies, with a crash of bones, rags, and wooden cases, which raised such a dust as kept me motionless for a quarter of an hour, waiting till it subsided again. I could not move from the place, however, without increasing it, and every step I took crushed a mummy in some part or other. Once I was conducted from such a place to another resembling it, through a passage of about twenty feet in length, and no wider than that the body could be forced through. It was choked with mummies, and I could not pass without putting my face in contact with that of some decayed Egyptian; but as the passage inclined downwards, my own weight helped me on: however, I could not help being covered with bones, legs, arms, and heads, rolling from above. Thus I proceeded from one cave to another, all full of mummies, piled up in various ways, some standing, some lying, and some on their heads. The purpose of my researches was to rob the Egyptians of their papyri, of which I found a few hidden in their breasts, under their arms, and in the space above the knees, or on the legs, and covered by the numerous folds of cloth that envelope the mummy.'

Belzoni continued indefatigably making new researches both at Gornou and Carnae, but was at length put to flight by the machinations of the French, who had succeeded in gaining over to their party the bey of the province. Having completed his laborious occupations, our traveller returned to his old station at Thebes, where he continued his researches in the valley of Bebanel Malook. Here, among other remarkable antiquities, he discovered one relic of the ancient world, which certainly appears to rank among the most beautiful that have ever been exhumed. 'It is,' says he, 'a sarcophagus of the finest oriental alabaster, nine feet five inches long, and three feet seven inches wide. Its thickness is only two inches, and it is transparent when a light is placed inside it. It is minutely sculptured within and without with several hundred figures, which do not exceed two inches in height, and represent, as I suppose, the whole of the funeral procession and ceremonies relating to the deceased, united with several emblems, &c. I cannot give an adequate idea of this beautiful and invaluable piece of antiquity, and can only say that nothing has been brought into Europe from Egypt that can be compared to it. The cover was not there; it had been taken out and broken into several pieces.'

Of the tomb in which this extraordinary monument was found, a model was many years afterwards exhibited in London, and so exceedingly well executed was the representation, that, had it not been for the crowds of visitors, one might easily have imagined oneself in the sepulchres of the Egyptian kings. Belzoni wanted but one thing to render him one of the greatest antiquarian collectors in the world: this one thing was money. But for the lack of this many of his most arduous and well-planned enterprises came to nothing.

From Thebes, with which he was now as familiar as he was with London, he some time after this proceeded to Cairo. He had by this time acquired quite a passion for excavations, tomb-opening, and all those other pursuits by which travellers aim at diving into the mysteries of Egyptian manners and arts; and reflecting upon the success of Captain Caviglia in descending into the well of the Great Pyramid, the project of attempting the opening of the second occurred to him. It were beside my purpose to describe the difficulties which he encountered and overcame in the execution of this design. His labours were incessant; his expenses considerable; but, at length, after success had frequently appeared hopeless, the entrance to the interior chambers was found. 'After thirty days' exertion,' says he, 'I had the pleasure of finding myself in the way to the central chamber of one of the two great Pyramids of Egypt, which have long been the admiration of beholders!'

Having made some other discoveries, he again returned to the valley of the Nile, where he was for some time occupied in the removal of various antiquities. He then descended to the seacoast, and on the 20th of April 1819, set out from Rosetta, on an excursion to the district of Fayoum, and the Oasis of Jupiter Ammon. After roaming about the shores of Lake Moeris for some time, for he had no leisure for making researches, he visited the ruins of Aronde, consisting of a few granite columns, and fragments, and mounds, and burnt bricks. He then prepared to cross the Desert to the Oasis, which was an affair of some difficulty. Nevertheless, he at length succeeded in completing his preparations, and commenced his journey, accompanied by a Bedouin guide, and three or four other persons. Even here, in the Desert, ruins of Egyptian edifices, beautifully sculptured with hieroglyphics, were found. The scene at first lay among low rocks, sandy hills, and barren valleys, which were gradually exchanged for a plain of sand, as level as the sea, and thickly strewed with brown and black pebbles. They continued during five days their journey over this dreary waste, at the end of which time they perceived the rocks of the Oasis, and beheld two crows coming as it were to meet them. In the afternoon they entered the valley, which is surrounded by high rocks, and forms in the midst a spacious plain, about twelve or fourteen miles long, and about six in breadth. 'There is only a very small portion of the valley cultivated on the opposite side to that which we reached, and it can only be distinguished by the woods of palm-trees which cover it. The rest of the valley is wholly covered with tracks of sand, but it is evidently seen it has once been cultivated every where. Many tracks of land are of a clayey substance, which could be brought into use even now. There are several small hills scattered about, some with a natural spring at the top, and covered with rushes and small

plants. We advanced towards a forest of date-trees, and before evening we reached within a mile of a village named Zaboo, all of us exceedingly thirsty: here we observed some cultivation, several beds of rice, and some sunt trees, &c. Before the camels arrived, they scented the water at a distance; and as they had not drank since they left Rejan, they set off at full gallop, and did not stop till they reached a rivulet, which was quite sweet, although the soil was almost impregnated with salt. I observed here a great many birds, particularly wild ducks, in greater abundance than any other.

The first man who perceived them after their entrance into the valley evinced a disposition to shoot Belzoni; but, upon the explanation of the Bedouin guide, consented to conduct them to the village. 'We advanced,' says our traveller, 'and entered a lane between these plants; and as we penetrated farther, we entered a most beautiful place, full of dates, intermixed with other trees, some in blossom and others in fruit: these were apricots, figs, almonds, plums, and some grapes. The apricots were in greater abundance than the rest, and the figs were very fine. The soil was covered with verdure of grass and rice, and the whole formed a most pleasing recess, particularly after the barren scenes of the desert.'

His reception at this village was equivocal, there being several sheikhs, each of whom made pretensions to authority. Some were disposed to treat him kindly, while others, more morose, kept at a distance; but a few cups of coffee, judiciously distributed, and followed by a sheep boiled in rice, reconciled the whole; although they next morning, when they were again hungry, relapsed into their former rude manners. Like all other ignorant people, they supposed that he must necessarily be in search of treasure, and for some time refused to conduct him to the ruins of which he was in search; but upon being assured that whatever treasures might be discovered should fall to their share, while all he stipulated for was a few stones, they consented to accompany him. The ruins, which with much probability he concluded to be those of the temple of Jupiter Ammon, now served, he found, as a basement for nearly a whole village, in the vicinity of which he discovered the famous 'Fountain of the Sun,' which is warm at midnight and cold at noon. This is a well of sixty feet deep by eight square, which, overflowing in a considerable rivulet, serves to irrigate some cultivated lands. All around is a grove of palm and other trees. The temperature of the water, however, continues at all times the same; all its apparent changes being accounted for by the greater or lesser degree of heat in the atmosphere.

From this excursion Belzoni returned to Egypt, from whence he embarked for Europe about the middle of September 1819. After an absence of twenty years he returned to his family; whence he departed for England, where he completed and published his travels. A few years afterwards, this enterprising and able traveller fell in an attempt to penetrate into the interior of Africa."

THE NIGER.

THE Brothers Landers, whose unpublished travels have been already noticed in the Journal, having descended the Cubbie, a stream which falls into the Niger, soon entered the latter, of which we have the following description:—"On all the borders of the numerous branches of the river, as well as on its small islands, vast quantities of corn were growing; and it being near the time of harvest, it was nearly ripe, and waved over the water's edge very prettily. Platforms were every where erected to the height of or rather above the corn, which grows as high as ten or twelve feet. People were stationed on these to scare away the numerous flights of small birds, which do great mischief, and would, without this precaution, destroy the hopes of the cultivator. A boy or girl, and in many cases a woman with a child at her breast, and even a whole family together, we observed on the platforms, amusing themselves in this manner, without the slightest shade or covering of any kind to shelter them from the fierceness of the sunbeams. Standing erect and motionless, many of them looked like statues of black marble rather than living human beings; but others, particularly the women, disregarding their duty, were industriously employed in plaiting straw, supplying the wants of their children, manufacturing mats, dressing provisions, &c. In order the more effectually to frighten away the birds, several of the watchers were furnished with slings and stones, in the use of which they seem to be very skilful; besides these, lines of rope were fastened from the platform to a tree at some distance, to which large calabashes were suspended, with holes in them, through which sticks were passed, so that when the line is pulled away, they make a loud clattering noise. The calabashes are sometimes fastened whole to the rope, containing about a handful of stones, which answer the purpose of making a noise when put in motion, as well as the sticks. To this is often added the hallooing and screaming of the watchers, which is dismal enough to frighten an evil spirit, and it rarely fails to produce the desired effect. The inhabitants of many of the numerous walled towns and open villages on the banks of the Niger, and also of the islands, we find are for the most part Cumbric people—a poor, despised, and abused, but industrious

and hard-working race. They are but too often oppressed and persecuted by their more fortunate and powerful neighbours, who affirm that they are fitted by nature only for slaves, and are therefore invariably treated by them as such.

Tuesday, Oct. 5th.—Before sunrise this morning, our luggage was removed to the beach, and between six and seven o'clock we were once more upon the water. Just below the town of Bajiebo, the Niger spreads itself into two noble branches, of nearly equal width, formed by an island. We preferred journeying on the eastern, but for no particular reason. The country beyond the banks was very fine. The island in the middle of the river is small, but verdant, woody, and handsome; and we passed by the side of it in a very few minutes, with considerable velocity. It was then that both banks presented the most delightful appearance. They were embellished with mighty trees and elegant shrubs, which were clad in thick and luxuriant foliage, some of lively green, and others of darker hues; and little birds were singing merrily among their branches. Magnificent festoons of creeping plants, always green, hung from the tops of the tallest trees, and drooping to the water's edge, formed immense natural grottoes, pleasing and grateful to the eye, and seemed to be fit abodes for the Naiads of the river."

EMIGRATION.

THE next farm which Mr Fergusson visited was that of Mr Chesney, and which he marks No. 3 in the list. "This farm," says he, "measures 106 acres, with wood sufficient for the use of the property—about forty acres of very fine holm, capable of yielding, I was assured, 40 or 45 bushels of oats, or other grain in proportion. This farm could be had for L.530, and would certainly return L.45 or L.50 clear. It was in very fair order.

4th, Mr Vely's farm, 118 acres, 40 acres of most superior holm; the upland good, with a stream running through it. The houses appeared to be new. This farm could be had for L.400, and the return could not be less than L.35 or L.40.

5th, A farm of 300 acres, occupied by Colonel Grant, at a rent of 300 dollars, L.67, 10s. The soil is good loam; nine parts of it are clay. A new dwelling-house and a good barn, with a valuable wood lot. It might be bought for L.1500.

The whole of these properties were evidently susceptible of great improvement, though in foul and bad condition. The local situation was good; the Champlain Canal passing within half a mile, but separated by the river. The roads are either already turnpike, or becoming such, though certainly not of a description to pass through the ordeal of Mr Macadam. Nos. 3 and 4 are contiguous, and might be advantageously thrown into one estate.

The American farmers live comfortably, and at a very moderate expense. Candles and soap are generally manufactured from kitchen refuse. A good housewife assured me that the butcher's meat for her family, fifteen in number, did not exceed in whole 1s. per day (three meals), except when she allowed them turkeys and other poultry, when she reckoned the expense at 2s. 6d. The flour consumed did not exceed 4s. 6d. per week. They have fruit, both fresh and preserved, in the utmost profusion; and the cider barrel is always ready broached. A good many articles of clothing are spun or woven at home; and the geese are subjected to periodical contributions towards the bedding of the household, or the feathers sold at a good price.

At a later period in my tour, I passed through a considerable portion of the Genessee country, celebrated for its great fertility, and the superior quality of its produce. Upon entering this part of New York state from Canada, I was immediately struck by the superior quality of the cattle. On many farms I observed a variety of these in shape and size greatly resembling the heavy class of our West Highlanders. They were chiefly of a dark brindled colour, and many of them really handsome. I did not see one portion of the Genessee district, which is said to be uncommonly rich; but what came under my view, in a journey of between three and four hundred miles in this part of the country, was certainly very fine. The surface is finely undulated—rivers, brooks, lakes, farms, villages, and forest scenery, all presenting themselves in succession. The soil is sometimes rather light, but generally a good, and often a rich, black loam.

The crops of wheat, clover, rye, peas, and Indian corn, all looked well, and the orchards of peach, plum, apple, &c. were richly laden with blossom. The houses and buildings I found generally very good. Where land is let for a money rent, it is commonly 4s. 6d. per acre. Old farms sell at from L.4, 10s. to L.9 per acre, including houses, orchards, &c.

I found every where in this quarter noble single trees, elm, oak, &c. judiciously left in the fields, affording both ornament and shelter, and the total absence of which, in many cultivated portions of Canada and the States, gives an appearance of nakedness even in situations where wood is treated as a nuisance. I would remark, also, that a great improvement, in shelter and beauty, would be effected by frequently substituting hedges for rail-fences. An English farmer near Geneva, I was informed, has miles of fine hawthorn hedges, four feet high, and completely belying the assertion that thorns will not succeed in America. His practice is to plant in a trench, not upon a ridge or bank, as the great risk of failure is from the summer drought. Before reaching Albany, I travelled the greatest part of one day through the valley of the Mohawk, and upon which lie the rich German flats. It is a noble country, and the land of the first quality, but farmed too often in a slovenly manner. The country of Michigan, which I have selected as a sample of new settlement in the west, has in a great degree supplanted Ohio, Illinois, &c. It lies between 41° 31' and 45° 40' N. Lat., and 5° 12' and 10° West Long., to the westward of Lake Erie, and including an immense extent of country capable of improvement, with fine water privileges. Detroit, an old French town, is its capital. By a reference to the map, it will be seen that Michigan can readily avail itself of New York, New Orleans, or Montreal, as markets, and must of course derive from such facilities of intercourse considerable advantage. The climate is temperate and healthy. Winter sets in generally about the middle of November, and continues till about the middle of March. At Detroit, in 1818, the mean heat of January was 24°; and in 1820, the mean heat of July was 69°; of December 27°. The soil is in general a good fertile loam, upon limestone; and in some places a calcareous earth is turned up, mixed with the common soil, which is extremely productive. Clay is also prevalent in some parts. This territory is better watered than any other in the United States. There is an abundance of game, deer, bears, hares, ducks, turkeys, quails, &c., and it is finely diversified with lakes and brooks, rising in most parts from copious springs.

Michigan is not yet admitted into the Union as a state. Intelligent settlers consider this to be no disadvantage. The expense of their public works, as roads, bridges, jails, court-houses, &c., is defrayed by the general government, in place of being assessed upon themselves; and although they cannot boast of one or two members of Congress, their interests are sufficiently watched by a delegate, who resides at Washington for that purpose. Mr Stackhouse describes the scenery as in many places highly romantic. The timber consists of black walnut, elm, beech, oak, hickory, sugar maple, &c. The produce of the land runs from 25 to 50 bushels after one bushel sown of wheat, Indian corn, &c. Turnips are likely to succeed well, also beet and mangel wurzel. Prices of stock, &c. seem to be much the same as in Canada. Horses cost from L.18 to L.22, 10s.; oxen from L.15 to L.18 a pair. Mechanics are establishing themselves wherever demand for their labour is found. The lakes and rivers abound with fish, as trout, white fish, bass, &c., and game is plentiful. The Indians are found in the more remote parts of the country, but they are perfectly harmless, and seldom come near the settlers. I may add, that the journey from Michigan to New York is easily accomplished in six days.

In 1820, a government expedition was sent into the western country, for the purpose of ascertaining the natural advantages and productions. The report is highly favourable to the fertility and capabilities of Michigan. An extensive range of country upon the River and Bay of Saginaw, on Lake Huron, is spoken of, in terms of high admiration, for the richness of the soil, and natural beauty of the scenery, and also as presenting uncommon inducements to enterprising and industrious farmers and mechanics, from its central and advantageous position for business. Saginaw Bay is about 60 miles in length, and 30 miles wide, with numerous fine islands. It is 180 miles west of Detroit. Game is mentioned to be very abundant, consisting of deer, bear, brown rabbit, or hare, weighing about 6lb., partridge or grouse, pigeons, ducks, &c. Fox River is also specially noticed as highly desirable for settlers, in regard to quality of soil, beauty and local advantages. It runs into the west end of Lake Michigan."—*Agricultural Journal*.—To be continued.

COLUMN FOR THE STUDIOUS AND SCIENTIFIC.

PROGRESSIVE CONDITION OF MAN.

WHILE the inferior races of animals seem to have changed as little in any respect since the beginning of human records, as the trees and herbs of the thickets which give many of them shelter, the condition of man himself has fluctuated, and, on the whole, progressed, in a very remarkable manner. The inferior animals were formed by their Creator such, that, within one life or generation, they should attain all the perfection of which their nature was susceptible. Their wants were either immediately provided for—as instanced in the clothing of feathers to birds, and of furs to quadrupeds; or were so few and simple, that the supply was easy to very limited powers—except in a few cases where considerable art was required, as by the bee in making its honey-cell, or by the bird in constructing its beautiful nest, and there, a peculiar aptitude or instinct was bestowed. Thus, a crocodile which issues from its egg in the warm sand, and never sees its parent, becomes as perfect and knowing as any crocodile that has lived before or that will appear after it. But how different from this is the story of man! He comes into the world the most helpless of living beings, long to continue so; and if deserted by parents at an early age, so that he can learn only what the experience of one life may teach him—as to a few individuals has happened who yet have attained maturity in woods and deserts—he grows up in some respects inferior to the nobler brutes. Now, as regards many regions of the earth, history exhibits the early human inhabitants in states of ignorance and barbarism, not far removed from this lowest possible grade, which civilised men may shudder to contemplate. But these countries, occupied formerly by straggling hordes of miserable savages, who could scarcely defend themselves against the wild beasts that shared the woods with them, and the inclemencies of the weather, and the consequences of want and fatigue, and who to each other were often more dangerous than any wild beasts, unceasingly warring among themselves, and destroying each other with every species of savage, and even cannibal, cruelty—countries so occupied formerly, are now become the abodes of myriads of peaceful, civilised, and friendly men, where the desert and impenetrable forest are changed into cultivated fields, rich gardens, and magnificent cities. It is the strong intellect of man, operating with the faculty of language as a means, which has gradually worked this wonderful change. By language fathers have communicated their gathered experience and reflections to their children, and these to succeeding children, with new accumulation: and when, after many generations, the precious store had grown until simple memory could retain no more, the arts of writing, and then of printing, arose, making language visible and permanent, and enlarging illimitably the repositories of knowledge. Language, thus, at the present moment of the world's existence, may be said to bind the whole human race of uncounted millions into one gigantic rational being, whose memory reaches to the beginnings of written records, and retains imperishably the important events that have occurred; whose judgment, analysing the treasures of memory, has discovered many of the sublime and unchanging laws of nature, and has built on them all the arts of life, and through them, piercing far into futurity, sees clearly many of the events that are to come; and whose eyes and ears and observant mind at this moment, in every corner of the earth, are watching and recording new phenomena, for the purpose of still better comprehending the magnificence and beautiful order of creation, and of more worthily adoring its beneficent author. But there is a change going on in the world, connected closely with the progress of science, yet distinct from it, and more important than half of the scientific discoveries—it is the *diffusion of existing knowledge* among the mass of mankind. Formerly knowledge was shut up in convents and universities, and in books written in the dead languages—or in books which, if in the living languages, were so abstruse and artificial, that only a few persons had access to their meaning; and thus, considering the human race as one great intellectual creature, a small fraction only of its intellect was allowed to come into contact with science, and therefore into activity; which fraction, moreover, was often only half exerted, because sufficient motive was wanting. The progress of science in those times was correspondingly slow, and the evils of general ignorance prevailed. Now, however, the strong barriers which confined the stores of wisdom have been thrown down, and a flood overspreads the earth; old establishments are adapting themselves to the spirit of the age; new establishments are arising; the inferior schools are introducing improved systems of instruction; and good books are rendering every man's fireside a school. From all these causes there is growing up an *enlightened public opinion*, which quickens and directs the progress of every art and science, and through the medium of a free press, although overlooked by many, is now rapidly becoming the governing influence in all the affairs of man.—*Arnott's Physics*.

DISTANCE OF THE FIXED STARS

The perfection of astronomical instruments has afforded the prospect of being able to determine the Annual Parallax, and, consequently, the distance of the fixed stars; but the quantity of deviation is so small as to have hitherto eluded the closest observation. It cannot amount to a single second in the most conspicuous and probably the nearest of the stars. These luminous bodies must therefore be more distant at least two hundred thousand times than the measure of the diameter of the earth. The light emitted from such neighbouring suns, though it flies with enormous rapidity, must yet travel more than six thousand years before it approaches the confines of our system. But scattered over the immensity of space, there may exist bodies which, by their magnitude and predominant attraction, retain or recall the rays of light, and are lost in solitude and darkness. Had the celerity of the luminous particles not exceeded four hundred miles in a second, we should never have enjoyed the cheering beams

of the sun. They would have been arrested in their journey, and drawn back to their source, before they reached the orbit of Mercury. But a star similar to our sun, and having a diameter 63 times greater, would entirely overpower the impetus of light.—*Encyc. Brit. new edit.*

FAHRENHEIT.

The first who succeeded in constructing thermometers with adequate skill was Fahrenheit. This ingenious man had been a merchant at Dantzic, and through misfortune failed in business; but having a good taste for mechanics, he removed into Holland, and settled as a philosophical instrument maker at Amsterdam. He began with spirit of wine thermometers, which he formed much smaller and neater than had been attempted before. But he soon preferred quicksilver, and having found it to expand from freezing water to blood heat, about 60 parts in 10,000, he assumed the number 64, and obtained the degrees by repeated bisections. In this practice he was confirmed, on observing what he considered as extreme cold, to descend just through half that space, or 32 degrees. From a mixture of water, ice, and sal ammoniac, the scale commenced; 32 degrees were allotted for the interval to ice-water, and 64 more for the ascent to blood heat. But he afterwards enlarged the range, and assumed another point from the limit of boiling water, which he placed at the 212th degree in the mean state of the atmosphere, though liable to some variation from the change of barometric pressure. Such was now his confidence in the delicacy of the construction, that he proposed the thermometer as an instrument for ascertaining the heights of mountains from the depressed temperature of boiling water; a very simple method, which has been lately revived by the reverend Mr Wollaston.—*Ibid.*

EXPERIMENTS ON THE CHANGES OF WIND.

Dr Forster of Boreham has found, by a long series of experiments made with small air balloons, that the upper currents of air, which cross each other in various directions in more elevated regions of the atmosphere, usually come down, and blow next to the surface of the earth and the waters, in the same order of succession in which they have previously blown aloft. He thinks, likewise, that the currents of wind which he has encountered in his numerous journeys over mountains, in the pursuit of meteorological phenomena, have been explained on similar principles to those which blow over the sea; and that the Alpine gales which cross the mountain-tops in the Swiss and Savoyard Alps, descend and sweep the valleys within the space of thirty hours. These experiments were begun so long ago as the year 1811; and after fifty or more experiments with small balloons, and nearly double that number with large kites, tied one above another, so as to ascend to great heights, he has deduced the result, not only that upper currents descend to the earth, but also that gales of wind are usually circumvolvent, like whirlwinds of great extent, and do not, as has been hitherto supposed, blow in straight lines. Dr Forster has likewise made the important remark, that during his last aerial voyage in a very large balloon, filled with inflammable air, he moved in a circuitous or gyrating course, the periphery of which diminished, or, in other words, the curvature increased as the balloon ascended; and that, in proportion as the spiral approached its vertex, at the elevation of above six thousand feet, the motion was slower. This circumstance is exceedingly curious, being the reverse of the mechanical law, according to which equal areas are described in equal times by revolving bodies; and it tends, therefore, to prove that the causes of wind are not mechanical, but electrical.

POLARISATION OF LIGHT.

Some remarkable facts accompanying the double refraction produced by Iceland spar, which Bartolin, Huyghens, and Newton, had observed, led the latter to conceive the singular idea that a ray of light, after its emergence from such a crystal, acquires *sides*, that is to say, distinct relations to surrounding space, which it carries with it through its whole subsequent course, and which give rise to all those curious and complicated phenomena which are now known under the name of the *polarisation of light*. These results, however, appeared so extraordinary, and offered so little handle for further inquiry, that their examination dropped, as if by common consent; Newton himself resting content with urging strongly the apparent incompatibility of these properties with the Huyghenian doctrine, but without making any attempt to explain them by his own. From the period of Newton's optical discoveries to the commencement of the present century, no great accession to our knowledge of the nature of light was made, if we except one, which, from its invaluable practical application, must ever hold a prominent place in the annals both of art and science; we mean the discovery of the principle of the achromatic telescope, which originated in a discussion between the celebrated geometer Euler, Klingenshierna, an eminent Swedish philosopher, and our own countryman, the admirable optician Dollond. After a long torpor, the knowledge of the properties of light began to make fresh progress about the end of the last century, advancing with an accelerated rapidity, which has continued unabated to the present time. The example was set by our late admirable and lamented countryman, Dr Wollaston, who re-examined and verified the laws of double refraction in Iceland spar announced by Huyghens. Attention being thus drawn to the subject, the geometry of Laplace soon found a means of explaining at least one portion of the mystery of this singular phenomenon, by the Newtonian theory of light, applied under certain supposed conditions; and the reasoning which led him to the result (at that time quite unexpected) may justly be regarded as one of his happiest efforts. The prosecution of the subject, which had now acquired a high degree of interest, was encouraged by the offer of a prize on the part of the French Academy of Sciences; and it was in a memoir which received this honourable reward on that occasion in 1810, that Malus, a retired officer of engineers in the French army, announced the great discovery of the *polarisation of light* by ordinary reflection at the surface of a transparent body. Malus found that when a beam of light is

reflected from the surface of such a body at a certain angle, it acquires precisely the same singular property which is impressed upon it in the act of double refraction, and which Newton had before expressed by saying that it possessed *sides*. This was the first circumstance which pointed out a connection between that hitherto mysterious phenomenon and any of the ordinary modifications of light; and it proved ultimately the means of bringing the whole within the limits, if not of a complete explanation, at least of a highly plausible theoretical representation. So true is, in science, the remark of Bacon, that no natural phenomenon can be adequately studied in itself alone, but, to be understood, must be considered as it stands connected with all nature.—*Herschel's Natural Philosophy*.

INVENTION OF THE COMPASS.

The valuable invention of the compass is equally involved in mystery, and its real discoverer is unknown. Lafiteau, in his history of the Portuguese Discovery in the New World, says, that Vasco di Gama brought it to Lisbon from the coast of Africa, on his return from Meliada, where the Arabs then used it, and he believed the Portuguese to have been until then ignorant of it. Some attribute it to Flavia Gioja of Amalphi, about the year 1302; while others again are of opinion that the invention is due to the Chinese, and that one of their emperors, a celebrated astrologer, was acquainted with it 1120 years before the Christian era; nor have others again been wanting, who have supported the opinion that it was known in the time of Solomon. The ancient Greeks and Romans are also supposed by some to have used it, but the silence of Pliny on this subject, says Senor Navarete, "renders this doubtful."—*Nautical Magazine*.

MARINE POPULATION.

The ocean teems with life—the class of polyps alone are conjectured by Lamarck to be as strong individuals as insects. Every tropical reef is described as bristling with corals, budding with sponges, and swarming with crustacea, echini, and testacea, while almost every tide-washed rock is carpeted with fuci and studded corallines, actiniae, and mollusca. There are innumerable forms in the seas of the warmer zones, which have scarcely begun to attract the attention of the naturalists; and there are parasitic animals without number, three or four of which are sometimes appropriated to one genus, as to the Balæna, for example. Even though we concede, therefore, that the geographical range of marine species is more extensive in general than that of the terrestrial (the temperature of the sea being more uniform, and the land impeding less the migrations of the oceanic than the ocean those of the terrestrial), yet we think it most probable that the aquatic species far exceed in number the inhabitants of the land. Without insisting on this point, we may safely assume, as we before stated, that exclusive of microscopic beings, there are between one and two millions of species now inhabiting the terraqueous globe; so that if only one of these were to become extinct annually, and one were to be every year called into being, more than a million of years would be required to bring about a complete revolution in organic life.—*Lyell's Geology*.

SONNETS BY WORDSWORTH.

ADMONITION.

Intended more particularly for the perusal of those who may have happened to be enamoured of some beautiful place of retreat, in the country of the lakes.

Yes, there is holy pleasure in thine eye!
—The lovely cottage in the guardian nook
Hath stirred thee deeply: with its own dear brook,
Its own small pasture, almost its own sky!
But covet not the abode—foremost to sigh,
As many do, repining while they enjoy;
Intruders who would tear from nature's book
This precious leaf, with harsh impiety.
Think what the home must be if it were thine,
Even thine, though few thy wants!—Roof, window, door,
The very flowers are sacred to the poor,
Thou roses to the porch which they entwine:
Yea, all, that now enchants thee, from the day
On which it should be touched would melt, and melt away.

GRANDŒUR OF NATURE.

The stars are mansions built by Nature's hand:
The sun is peopled; and with spirits blest,
Say, can the gentle moon be unpossessed?
Huge ocean shows, within his yellow strand,
A habitation marvellously planned,
For life to occupy in love and rest;
All that we see—is dome, or vault, or nest,
Or fort, erected at her sage command.
Is this a vernal thought? Even so—the Spring
Gave it while cares were weighing on my heart,
Mid song of birds, and insects murmuring;
And while the youthful year's prolific art—
Of bud, leaf, blade, and flower—was fashioning
Abodes, where self-disturbance hath no part.

COMMERCE OF THE BRITISH EMPIRE.

It appears from a document laid before Parliament, relative to the exports and imports of this country for the year ending the 5th of January 1829, that the total of our exports to France was only £546,000, being less, by above £130,000, than our exports to Prussia, whilst our imports from France exceeded £2,600,000. Our imports from Russia amounted to above £4,000,000, and our exports to above £2,500,000—but the balance of trade with that country has hitherto been in our favour. From Germany and the Netherlands we imported to the value of a little more than £3,000,000, and we exported to these countries to the amount of above £14,000,000. The imports from Gibraltar were small, but our exports exceeded £2,000,000. With Spain and the Canaries the imports exceeded the exports by about £1,500,000. With Turkey the exports amounted that year to above £1,200,000, and the imports to about £600,000. With Portugal, the exports exceeded the imports by about £2,000,000. Such was the relative state of our European imports and exports. The exports to and imports from Barbary, Egypt, and the western coast of Africa, the Cape of Good Hope, Mauritius, and the Isle of Bourbon, nearly balanced each other, and did not exceed £1,000,000. Asia afforded a larger sum both in imports and exports. To the East Indies and China we exported to the value of £6,300,000, and imported nearly £8,000,000. From the British North American colonies and the West Indies we imported above £8,700,000, and we exported above £6,200,000. With the United States there was a difference of about £6,000,000 only between our exports and imports: the former being £3,600,000, and the latter £7,997,000. To the Brazils we exported above £3,822,000, and imported £1,382,000. To the South American republics our exports exceeded our imports by about £2,200,000. The gross amount of our exports in the above year was £62,716,702, and of our imports, £45,168,488.

EDINBURGH CHAMBERS JOURNAL

CONDUCTED BY WILLIAM CHAMBERS, AUTHOR OF "THE BOOK OF SCOTLAND," "GAZETTEER OF SCOTLAND," &c.

No. 10.

SATURDAY, APRIL 7, 1832.

PRICE THREE HALFPENCE.

PRIVATE LIFE OF JAMES IV. OF SCOTLAND.

(Concluded.)

IN 1503, James formed that alliance with the Princess Margaret of England, which, one hundred years after, united the sovereignty of the two countries, and paved the way for a more intimate and beneficial connection. His preparations for this solemn ceremony were upon a most magnificent scale: the entries extend through forty leaves of the record. No less a sum than L.1045, 5s. 9d., Flemish money, is spent in the purchase of silver plate in Flanders. July 16, 1503, there was given "to Matho Auchleik, goldsmith, that wantit of the kingis crowne, v. ridaris [a denomination of weight], twa Scottish crownis, half ane angell, weyand ane unce," equal to seven pounds thirteen shillings and fourpence. Many other entries occur relative to the repairing of the regalia, and a new crown to the queen. Amongst an immense variety of household furnishings, including the state bed, dresses, &c., occurs the following:—"Item, bocht fra James Hommil ane pece of Hercules, ane pece of Marcus Cori[ol]anus, twa peces of Susanna sewit togidder, ane cover for ane bed of Susanna, ane pece of Salamone, contening in the hale ten score elne, and bocht all for" one hundred and sixty pounds. Two "hary nobles" [reader, be not alarmed, coins are meant*] are given "to gilt the kingis cepture." On the day of the marriage, the following entry is made:—"The 8 day of August, the king was spousit, and gifin to him, quhilk he laid on the buke, vi. demyis and v. shillings quhyt silver." "Item, to put in his caudill, and the quenis caudill, ij. French crownis." But the most curious remains:—"Item, the 9 day of August, efter the marriage, for xv. elne claith of gold to the Comites [Countess] of Surrey of Ingland, quhen sche and her dochter Lady Gray *clippit the kingis berde*, ilk elne xxiiij., three hundred and thirty pounds. This somewhat expensive frolic acquires a melancholy interest from the reflection, that only ten years after, the husband of the fair barber (who in fact conducted the queen into Scotland) met and slew the King of Scots at Flodden! August 10, the sum of fourteen shillings was paid "to Maistr. James Henri-sonnis man, of bridill silver of ane hors giften for the quene, for hir hors were brynt in Dalkeyth." Dalkeyth was the last stage of the queen's journey before she arrived at Edinburgh; and this, we should suppose, refers to some accident which had befallen her stable at that town. We learn that the "carturis of Leith," a class of men still existing in an associated capacity, received six pounds twelve shillings for the use of twenty-two carts (six shillings each) to bring "the quenis gere [luggage] to Edinburghe fra Dalkeyth." Numerous sums were disbursed to persons of the queen's train. Twelve pounds is paid for a present of "Hollande claith giften to the Archbischep of Zork." The "trumpitis of Ingland" got forty French crownis; "the English spelair (climber) that playt the supersalt" is honoured with five; and the "eight Inglis menstralis" (of whom four remain with the queen) got forty. The "bere ledair of Ingland" receives eight crownis; "the portair" eight, "to by him ane hors;" and "the coffair" gets eighty "Scotch ridaris," which were equal to ninety-two pounds. The "coffair" must have been an official connected with "the Inglice coffir," for which four shillings are paid on the 12th August, to six men that carried it "fra the Abbey to the Castell of Edinburghe." Probably the coffir contained the first instalment of the queen's

dowry, which altogether consisted of thirty thousand gold angels, payable in three equal portions.

The marriage, as related by our historians, was celebrated with many of those chivalric exercises of which the king was so fond. Accordingly, we find innumerable entries on this score. "August 21—payit to Johnne Mayne, bowar, for sixty justing speris at the marriage, ilk pece iij.s., nine pounds. "Item, for sex score speris for turnaying," eighteen pounds. "Item, ane blak burdowne spere," five shillings. "Item, to Robert Cutelar, for 24 swordis, 41 lang, and 12 short swordis, for turnaying, ilk pece 10 shillings," forty pounds. Sums are paid for "spere hedis," and for "viraies and diemandis for speris." "September 19—to ane man to pas to Strivilin (Stirling) for bataille axes and swordis, and to cum agane that nycht," nine shillings. "October 24—to the heraldis for their composicioun of the eschet of the barres quhen Christofere Tailyour faught," six pounds thirteen shillings and fourpence. "November 22—to Moncur, armorar, for ane pair of cuschingis, brases, and mending of the kingis harness, at the turnaying," five French crownis. It is certainly curious to see the glitter of a tournament thus traced to the workshop, and expressed in pounds, shillings, and pence.

It is equally curious to trace, in the succeeding year, the whole paraphernalia, pomp, and circumstance of a judiciary expedition to the Borders for the repression of the thieves and broken men. This affair, styled the Raid of Eskdale, commenced in July 1504, and every item of the expense is regularly entered by the Lord Treasurer. It is a strikingly characteristic circumstance, or seems to be so, that the first expense is for horses to carry two of the king's minstrels into Eskdale, as if it had been necessary that provision should be made beforehand for entertaining his majesty with music whenever he should arrive at the scene of operations. Then there are expenses for new "leg-splentis" [greaves] to the king, for "twa dosane arrowes" and as many bow-strings, and for new jacks to several of his attendants, among whom is Thomas Boswell, the founder of the family of Auchinleck. James Hog, the tale-teller, gets eight-and-twenty shillings in part payment of "twa horse" to take the king's harness or armour into Eskdale. Twelve pounds are paid for four cross-bows and a hundred bolts; and five pounds and tenpence for "five pair spuris to the king, two pair steraip irlis, twelve riding-girths," &c. The king's *lect de camp*, or portable bed, is mended at an expense of four shillings, and carried forward to Eskdale for a further sum. There are some entries of a rather suspicious character, for two ladies respectively designated "Besse Haig" and "Besse Bertrame." For instance, August 2, 1504—"to Andro Aytoun, for Besse Haigis expense ilk day, xij. d.;" "the 10 day of August in Bigar to Besse Bertrame, be the kingis command," twenty-eight shillings. But, without further evidence, we do not consider ourselves entitled to draw any inference from these delicate premises.

The king appears to have gone first to Dumfries, passing through Biggar. August 13, forty-two shillings are disbursed at Dumfries, "to menstralis, to fe thair hors to Eskdale, and syne againe to Dumfries." "August 14—to the piparis of Dumfries, xliij.s." The next entry under our notice occurs on the 17th, when fourteen shillings are paid "to the man that hangit the thieves at the Hullirbuss," besides eightpence "for ane raip to hang thaim in"—all pretty men, no doubt, and well lamented by the ladies of Langholm. Four days after, fourteen shilling are paid "to the man that hangit the thieves in Canonby." On the same evening,

"the king was regaled with singing by two English women in his pallioun," at an expense of four-and-twenty shillings. Fifty-six shillings are given under the same date to "ane Ingliseman that gair ane bow and arrowes to the king." About this time, nine shillings are paid to "ane gyde to pas with Sir Thomas Alane to Edinburghe, for wyne to the king in Eskdale." On the 23d of August, the king is at Lochmaben, in company with the English warden, Lord Dacre, to whom he loses several sums at cards. He is again at Dumfries on the 7th, when he buys "ane Portuguese skin to be halk hudis," for which fourteen shillings are paid by the treasurer. Next day a curious entry occurs—"Be the kingis command, to William Spicehouse, in contentacioun of ane ring quhilk the king take fra him," fourteen shillings. On the 9th, five shillings are paid to "ane wif quhair the king baitet at the halking." The king, in this expedition, not only had his minstrels to cheer his hours of relaxation, but also musical instruments, and those not the most portable. "September 11—to Johnne Goldsmythe, for tursing [packing and carrying] of the *oganis* in Eskdale," forty-two shillings. An entry, exhibiting the king's sense of justice and generosity, takes place at this time:—"September 14—in Lochmaben, to ane puir man that all the court tak his lay fra him," ten shillings. Various other entries to the same effect are scattered throughout the accounts. For instance, on the very same day, he gives a unicorn, or eight-and-twenty shillings, to "ane Ingliseman that was ship-broken." In his journeys he frequently gives small sums (generally sixteenpence) to "puir wyffis be the gait." In September 1488, when just beginning his reign, he gives two pounds fourteen shillings "to puir wyffis of Ballinrefe that had thare gudis takin away be Johnne Stewart;" and on the same day eighteen shillings "till oore twa puir wyffis that the king spilt [spoiled] there corn."

At Lochmaben, on the 17th, being then on his return to the capital, he orders fourteen shillings to be given "to the crukit vicar of Dumfries, that sang to the king." Between the 17th and 19th, he seems to have been at Peebles:—"Item, in Peblis, to ane man of the lard of Dawikis, that brocht twa fair hounds to the king," fourteen shillings. This country gentleman had brought him a present of five herons at his marriage; and we now find a man feed with nine shillings and sixpence "to bere quik herounis to Dunfermlyne fra Peblis," probably a second present from Dawick. His return to the capital is marked by his giving twelve pence on the 19th "to ane puir wif on the mure of Edinburghe."

It is well known that James suffered considerably from remorse on account of the concern which he had, however innocently, in his father's death. Beneath all his gaieties there lurked a rankling care; and though his exterior was that of a gallant and insouciant knight, he wore next his skin a heavy penitential chain, to which a link was added every year. As another method of making his peace with heaven, he used to undertake pilgrimages to the remote shrine of St Duthoc at Tain, which was then held in particular sanctity. The accounts upon one of these journeys afford a curious jumble of gay and solemn things; for it is to be observed that there was no penitence by the way. The whole train of minstrels, and other officials necessary to the king's pleasure, are carried with him; and he indulges as much as usual in sports and games. "October 14, 1508—in Brechin, to the king, to the cartis [cards] ix. Fr. cr., and tynt xiiijl." "October 15—in Dunnottir, to the chield that playit on the monocordis," eighteen shillings. "October 16—to

* Nobles of the coinage of Henry VII., the contemporary English king.

the piparis of Aberdene, be the kingis command," eighteen shillings; "Item, that nycht to the falconaris in Inverowry, the king being in Fintree, to their expense," eight shillings. "October 19—to the madinis of Forres that dantis to the king, ix. s.;" "Item, to the madinis that dantis at Elgyn sickle, ix. s. vi. d.;" "Item, to the madinis that dantis at Dornway, xiijs.;" "October 20—in the Chanonry of Ross [Fortrose], to John Goldsmith for tursing of the organis to Tayne, and hame again," four pounds; "Item, to the freiris of Ardoiseir, xiijs.;" "Item, to Robert Merroune, to pass owre the water with the goshaik, x. s.;" "Item, to the man that beris Sanct Duthois bell, iij. s.;" "Item, to the Lord of Balnagownis harper, be command," fourteen shillings. A like train of expenses takes place on the return of the king, with one of a peculiar nature:—"November 6—to James Dog, quihle he laid doune for claithe to be wippes to John Balfouris *sair leg, quihle the king helit*," six shillings and eightpence. This James Dog was the keeper of the royal wardrobe, and is alluded to in the poems of Dunbar, who, punning upon his name, asserts that he was "ane surly dog." We find that the king, not satisfied with a visit to the shrine of St Duthoc, at Tain, must have obtained a loan of his relique; for there is an entry on the 17th of November, of five shillings, for a man who carried that sacred object back from Dunfermline to its proper place.

The whole of the preceding details tend to show society in a very simple state, and great childishness and absence of the intellectual in the very highest man of the country. This is the more striking when we reflect that the name of James IV. has been sent down to us with a character not in the least silly, but rather above the average of ability and firmness. When a king devoted himself, as a matter of course, to seeing dancers and mummers, to hearing syrens in his chambers, to listening to tale-tellers and minstrels, and a thousand other amusements equally remote from rational, what must have been the intellectual habits of the uninstructed poor? It is a curious circumstance, that, amidst all the disbursements which have fallen under our eye, we have found only on two occasions any money given for what are called stationery articles. On one occasion a pen-horn and an ink-horn are purchased at ninepence; on another, several years after, the same articles are bought at twelpence. Thus, the king, throughout many years of his reign, is only observed to have spent one shilling and ninepence, Scots money, upon the means of communicating his ideas on paper; while his expenses for pleasures merely ministrant to the senses are bewildering from their number. It must be said, however, in justice to this sovereign, that, though he does not seem to have been addicted to writing, he occasionally indulged in books. Here and there we find such entries as "1507, December 22—for iij. prentit bukes to the king tane fra Andro Millaris' wyff," fifty shillings; "1502, April 6—to Walter Wodis' wyff for ane buke to the queen's grace," eleven pounds. To James IV., also, is due the honour of having first introduced printing into Scotland. In 1507 or 1508, he procured the materials of typography for Walter Chapman and Andro Millar, the first of whom, at least, was previously his personal servant; and in the latter of these years were produced several small pamphlets, containing a few of those long chivalrous tales which the king was in the habit of hearing from the mouths of the minstrels. The art was afterwards lost, probably on account of the troubles of the kingdom; and we hear no more of printing till 1541, when the public mind was beginning to feel the impulse of the Reformation.

THE ART OF PRINTING.

THE DISCOVERY—GUTTENBERG.

TOWARDS the conclusion of the preceding article on this subject, it was mentioned, that although the art of stamping words or sentences, by means of small blocks or signets, was known and practised in very early times, especially by the Chinese, yet such a modification of the craft of printing had no connection with the modern invention, which is now to be noticed. The discovery of the art of printing with moveable types, which took place in the fifteenth century in Germany, was considerably aided by a fashion, which had been some time prevalent, of cutting blocks of wood into pictures, or representations of scenes illustrative of Scriptural history, and printing them on paper, simply by the pressure of the hand, a brush, or a cushion behind. One of the very earliest of these woodcuts is still extant, and represents the creation of man, as detailed in the Book of Genesis. In the centre of the picture stands a figure, intended for the Divinity, having the appearance of an old man with flowing garments, a venerable beard, and rays proceeding from his head; on the ground before him lies a human being, intended for Adam, fast asleep; and from an opening in his side is seen proceeding the slender figure of a female, meaning Eve, who is taken by the hand of God, and is apparently receiving his blessing. The execution of this, and other cuts of a similar nature, is of the rudest description, and is a striking testimony of the low scale of art at the time. Pictures of this nature, which were bound up into books, nevertheless, were the immediate forerunners of the great invention itself. Books of prints, it will naturally be imagined, would soon be found imperfect, for want of descriptive text; this, therefore, urged on the discovery. The manufacturers of the books at

first cut single sentences, or words, and had them stamped below the pictures; but this not conveying a sufficient idea of the story represented, an anxiety arose to give a lengthened description on the opposite pages. This, it seems, was at length accomplished; still the sentences were all cut in a piece, and the notion of having separate letters so as to form words, was still in abeyance.

The person on whom history correctly places the honour of being the earliest discoverer of the art of printing by means of moveable letters, or types, was John Guttenberg, a citizen of Mayence, or Mentz, who flourished from the year 1436 to 1466, in the reign of Frederick III. of Germany. The ingenious Guttenberg is supposed to have been born at Mayence in the beginning of the fifteenth century, and to have settled at Strasburg about the year 1424, or perhaps rather earlier. In 1435, he entered into partnership with Andrew Drozhennis (or Dritzehen), John Riff, and Andrew Heelman, citizens of Strasburg, binding himself thereby to disclose to them some important secrets, by which they should make their fortunes. The workshop was in the house of Andrew Dritzehen, who dying, Guttenberg immediately sent his servant, Lawrence Beildich, to Nicholas, the brother of the deceased, and requested that no person might be admitted into the workshop, lest the secret should be discovered, and the forms (or fastened-together types) stolen. But they had already disappeared; and this fraud, as well as the claims of Nicholas Dritzehen to succeed to his brother's share, produced a lawsuit among the surviving partners. Five witnesses were examined; and from the evidence of Beildich, Guttenberg's servant, it was incontrovertibly proved that Guttenberg was the first who practised the art of printing with moveable types; and that, on the death of Andrew Dritzehen, he had expressly ordered the forms to be broken up, and the characters dispersed, lest any one should discover his secret. The words given in his order, which were established by documentary evidence, were these—"Go, take the component parts of the press, and pull them to pieces; then no one will understand what they mean." In the same document, mention is made of four forms, kept together by two screws, or press spindles, and of letters and pages being cut up and destroyed. The result of this lawsuit, which occurred in 1439, was a dissolution of partnership; and Guttenberg, after having exhausted his means in the effort, proceeded in 1445-6 to his native city of Mentz, where he resumed his typographic labours. Being ambitious of making his extraordinary invention known, and of value to himself, but being at the same time deficient in the means, he opened his mind to a wealthy goldsmith and worker in precious metals, named John Fust, or Faust, and prevailed on him to advance large sums of money in order to make further and more complete trials of the art. Guttenberg being thus associated with Fust, the first regular printing establishment was begun, and the business of printing carried on in a style corresponding to the infancy of the art. After many smaller essays in trying the capabilities of a press and moveable types, Guttenberg had the hardihood to attempt an edition of the Bible, which he succeeded in printing complete, between the years 1450 and 1455. This celebrated Bible, which was the first important specimen of the art of printing, and which, judging from what it has led to, we should certainly esteem as the most extraordinary and praiseworthy of human productions, was executed with cut-metal types, on six hundred and thirty-seven leaves; and from a copy still in existence in the Royal Library of Berlin, some of them appear to have been printed on vellum. The work was printed in the Latin language.

The execution of this—the first printed Bible—which has justly conferred undying honours on the illustrious Guttenberg, was, most unfortunately, the immediate cause of his ruin. The expenses incident to carrying on a fatiguing and elaborate process of workmanship, for a period of five years, being much more considerable than what were originally contemplated by Fust, he instituted a suit against poor Guttenberg, who, in consequence of the decision against him, was obliged to pay interest, and also a part of the capital that had been advanced. This suit was followed by a dissolution of partnership; and the whole of Guttenberg's apparatus fell into the hands of John Fust, who, from being the ostensible agent in the business of printing, and from the wonder expressed by the vulgar in seeing printed sheets, soon acquired the name of a magician, or one in compact with the devil; and, under this character, with the appellation of Dr Faustus, he has for ages enjoyed an evil notoriety.

Besides the above-mentioned Bible, some other specimens of the work of Guttenberg have been discovered to be in existence. One in particular, which is worthy of notice, was found some years ago among a bundle of old papers in the archives of Mayence. It is an almanack for the year 1457, which served as wrapper for a register of accounts of that year. This, says Hansard, would most likely be printed towards the close of 1456, and may consequently be deemed the most ancient specimen of typographic printing extant with a certain date. Antiquaries and Bibliomaniacs have found considerable difficulty in ascertaining by what process Guttenberg manufactured his types; but it seems the prevalent opinion that those which he first used were individually cut by the hand; and being all made as near a height and thickness as possible, they

were thus put together in the forms. It appears, however, that this skillful man soon discovered the mode of casting his types by means of moulds; for without this great accessory to the art of printing, he would perceive it was next to impossible to carry on his trade. The art of founding metal characters is therefore given to John Guttenberg, as well as that of printing, although it is but justice to state, that the plan of striking the moulds with punches was a subsequent invention of his successor, Peter Schoeffer. That Guttenberg was a person of refined taste in the execution of his works, is sufficiently obvious. Adopting a very ancient custom, common in the written copies of the Scriptures and the missals of the church, he used a large ornamental letter at the commencement of books and chapters, finely embellished and surrounded with a variety of figures, as in a frame. The initial letter of the first psalm thus forms a beautiful specimen of the art of printing in its early progress. It is richly ornamented with foliage, flowers, a bird, and a greyhound, and is still more beautiful from being printed in a pale blue colour, while the embellishments are red, and of a transparent appearance. What became of Guttenberg immediately after the unsuccessful termination of his lawsuit with Fust, is not well known. Like the illustrious discoverer of the Great Western Continent, he seems to have retired almost broken-hearted from the service of an ungrateful world, and to have spent most of the remainder of his days in obscurity. It is ascertained that in 1465 he received an annual pension from the Elector Adolphus, but that he only enjoyed this small compensation for his extraordinary invention a period of three years, and died in the month of February 1468.

A TALE OF VENICE,

By Charles Mac Farlane.

THE sun was sinking behind the dark blue hills of Priuli, and lengthening the shadows of Venice across the rippling waves of the Adriatic, when two senators, who were taking their evening promenade on one of the murazzi or outer terraces which the industry of man had gained and secured from a formidable element, perceived a trim galley on the purple line of the horizon, pressing forward towards the city.

"That should be a vessel of the state," said one of the signiors; "from whence may she be?"

"Why not from Constantinople?" replied his companion; "it is time that some of that conquering expedition should be returned to the 'winged lion.'"

"Saint Mark grant that it prove as you say! But she keeps a gallant course, and will soon be here to speak for herself."

The two senators, who, though both advanced in years, still glowed with that patriotic spirit which was destined to raise the low sunk islets of Venice to such unprecedented glory, leaned against a parapet wall that ran along the edge of the murazzo, fixing their earnest gaze upon the vessel, which, rapidly advancing, grew in magnitude to their eyes at every minute. As she neared, the last gleams of day showed the proud banner of the republic floating on her lofty stern.

"The galley is the 'Corriere' of the great Dandolo, the swiftest vessel of our fleets, and she comes the harbinger of happiness to thousands. The rest will not be far behind."

"Viva San Marco! Viva la Santi Chiesa! and the republic of Venice, that has placed the keys of Saint Peter within the boasted gates of Constantinople!" exclaimed the other senator.

Their aged voices had scarcely ceased to vibrate, when a loud continuous shout—a shout of transporting joy and triumph—rose from the deck and the rigging of the galley, and made itself heard, despite of distance and the lash and roar of the waves that broke in foam at the feet of the two senators. The next instant that soul-stirring acclamation was answered by another shout, that absolutely smothered, while it lasted, the sounds of wind and wave; and turning round, the senators saw on the edges of other terraces, and on the scattered islets that afforded the best points of observation, the mass of the population of Venice gazing like themselves on the returning galley. In an instant numerous barks were seen to glide from the canals, and, dancing in fantastic groups over the heaving sea, to pull with strenuous oars towards the ship; the patriotism or the more private affections of many not brooking the delay of a few minutes which would see her at anchor within Venice. As she came on, with the breeze that still freshened singing through her shrouds, a simultaneous display of countless blue lights was launched from her deck high into the heavens, where the crescent moon with "a single star at her side" seemed to smile at these testimonials of joy, and to welcome the wanderers back again.

The two senators quitted the parapet, and repaired with hasty steps to the galley-quay, where they found many of their order, with most of the leading citizens, already assembled, and anxiously awaiting to speak with the gallant commander of the "Corriere." Soon the welcome vessel stood with her prow a few spans length from the shore; and anon, with rapid manœuvre, she swung round, and lay with her broadside against the edge of the quay. Another shout and cry of triumph, and the captain leaped on shore, and, bowing before the senators and citizens, com-

municated the intelligence that the fleet approached, after having accomplished a victorious expedition. "Let this fair breeze," he continued, "blow till mid-night, and we shall see the vessels at rising of to-morrow's sun."

This news spread with the swiftness of lightning through the multitude, and thence through the whole city; and the reverend senator had predicted aright when he said "that for some there would be great joy in Venice on this night." There was indeed too much joy—and alas! in many instances too much assured sorrow, or harrowing apprehension, to permit of sleep. The affectionate wife with tears in her eyes kissed the little slumberer in his cradle, or assured the half-forgotten prattler on her knee that to-morrow he should see his father; or with provident care she turned over the humble treasures of her coffers, to select fitting raiment for her long absent spouse, or with diligent hands she prepared the restoring condiments, so welcome after the privations of a tedious sea-voyage, or she sought the draughts for the winecup which "maketh glad the heart of man." The fond mother, whose son had gone to the East, with the red-cross on his breast, rested not on her pillow, but gazing on the flickering lamp, asked a thousand times, "Oh! will the light of to-morrow's sun show me my boy in his strength and his beauty, or assure me that the light of life has for ever quitted his eyes!" The betrothed maiden, or she who had cherished a fond passion, paced her chamber floor with hurried steps, or, gazing out of her casement on the sea-waves, sighed to the strong winds that agitated them as love her young bosom—"And will he come with the morrow?—and will he love me as when he went?"

That short summer night seemed of interminable length at Venice; but the morrow came at last, and in the grey horizon, at the very point where the "Corriere" had first appeared on the preceding evening, a broad white sail was seen. A sail, and another, and another, rose to the eye from that sober but brightening line, until the whole fleet was in view, and advanced, the orb of day rising in the rear, like a vast flock of wild swans, glancing their long white necks and buoyant white wings in the golden beams of morning. In the city the matin summons to prayer sounded cheerfully on the ear, and in each Christian temple a song of thanksgiving succeeded the words of supplication. Our story is laid in very remote times; but it was not until these religious duties were performed, that the people of Venice began their preparations for the triumphal reception of their home-wending heroes, or hastened to meet the objects of their hearts' warm affections. But when, in their weakness and insufficiency, they had paid their due to heaven, they entered on the business of life with zeal, and the city was agitated from one end to the other. Carpenters and other artisans were employed in laying stages for the warriors to tread upon, in their descent from the victorious galleys, or in erecting platforms whence the Venetian fair might wave their kerchiefs to the brave, or galleries whence the musicians might hail the return of those who had prevailed in the good fight, with the Lion and Saint Mark for their aid! Women and children ran to gather the scanty supply of verdure and of flowers that the sea-girt city afforded; but others were dispatched to the mainland, to draw the laurel and the rose from the banks of the Brenta. Inanimate nature seemed to partake in the joy and triumph of man; and a bright exhilarating sun, a gay blue sky, a sea serene, and a breeze as gentle as the sigh of happy love, were propitious to Venice and her day of rejoicing.

Meanwhile the fleet came on, spread out into the figure of a crescent. Every ship was distinctly visible through that fine transparent atmosphere; and as they glided over the placid waters towards their place of rest, the appropriate banner of each was clearly seen, and the impatient citizens on shore could tell the particular galley in which had sailed a son, a brother, or a friend.

The fleet was now so near that the sounds of their warlike music were heard, and every detail, to use the language of the painter, was distinctly made out. The bright and painted shields of the returning knights and squires were arranged on either side of the galleys; the warriors stood on the deck in their armour of mail, with the silver-inlaid morion on their heads, and the burnished arms in their hands—the broad lance, the battle-axe, and the steel-tipped mace, threw back the rays of the sun with dazzling brightness; the "winged lion," the standard of the republic, flew over their heads; the bannerets of the patrician families of Venice floated on the elevated stern-quarter of the war ships; whilst the principal galley, which had borne the "blind old Dandolo" to the scene of his glory, was distinguished by a vast white banner, on which was inscribed in letters of gold, the new, the proud, "the singular but accurate title" of "lord of three-eighths of the Roman empire," assumed by the conquering doge, and afterwards retained by the Venetian republic.

The instruments of the musicians waxed louder and louder, until they burst on the ear with an overpowering peal. Then there rose to heaven a shout from those on shore that made Venice to ring through her hundred islets, and the cymbal and the harp, "the shrill trumpet, the spirit-stirring drum, the ear-piercing fife," gave back a response to the galleys, that,

"gilded by the sun, and reflected by the waters," now fast approached land.

On shore, as on the sea, the spectacle was imposing. Venice, indeed, was not yet the splendid city that claimed the world's admiration; she could not yet boast that accumulation of ancient and modern art which was afterwards to attract the stranger from many a distant land. It might be said, perhaps, that at the epoch of our tale, Venice was about equi-distant from when she was at her humble origin—a collection of low huts scattered on the sea-lashed sand-banks and rocks, whose poor inhabitants, Cassiodorus, the minister of Theodorice, compared to "water-fowl who had fixed their nests on the bosom of the waves"—and what she became after the sixteenth century, when the wealth of the East had been poured in her lap, and the genius of Palladio and others had filled her with beauty.

But the moral picture offered to contemplation by Venice at that period, was perhaps far more interesting and worthy of admiration. In Venice, "the art and spirit of commercial industry" had revived, and was then extending its Briarean arms to every shore of the Mediterranean. On the perilous career of conquest she had entered with great éclat, and, considering her origin and position, the influence she exercised on the politics of the south and east of Europe was astonishing.

The Piazzetta, which is situated by the side of the church of St Mark, then contained the principal edifices of the republic; and it was here the knights and the captains of the galleys, that had now come to anchor close to the quay, descended by stairs and platforms prepared for them, and covered with laurels and flowers, banners and silks of Tyrian dye; and it was here their anxious feet again touched their native soil, and their relatives and friends received them to their passionate embrace. As one by one they stepped on shore, the people rent the air with their acclamations: the signiors of the republic, in an open balcony, bowed to them, as a herald repeated their distinguished names; whilst the bands of music pealed the notes of triumph, and the fair daughters of Venice "looked and smiled a welcome." The general picture of joy and grief—and grief there was in the midst of all these rejoicings, for many returned not to bless the eyes of affection, but remained in the country they had conquered, and many had sped to those regions whence there is no return—this general picture would be far too vast even to be sketched here, and thus we will attach ourselves to the fortunes and feelings of one who figured in this day's pageantry.

Gherardo was the only son of the patrician Zani, and the most gallant youth of Venice. His love of military glory must have been great, for when the doge, the incomparable Enrico Dandolo, invited him to follow his banner to the East, he was betrothed to Bianca Celsi, as distinguished for her beauty as he for his valour. Yet, on the threshold of the hymeneal temple, he did not hesitate; he would go where glory and his countrymen summoned him; when the doge's exploits were achieved, he would return to Venice, and, more deserving of her, lay the laurels at the feet of his young bride. He had been, he had prospered—Constantinople had witnessed his valour—and now, returned, the Piazzetta echoed with the name of Gherardo. He had received the embrace of his aged father without alarm at his tears—for over-wrought joy will weep even as sorrow does; he had been pressed in the arms of the friends of his house and his infancy; and he now advanced to a gentler circle, composed of his female relatives and friends, who, stationed at a balcony, murmured the hero's name, and his welcome back to Venice. But what meant the omission? Bianca was not among them—Bianca, his spouse, was not there to welcome him with eye and tongue. His voice trembled as he hurriedly asked where she was. An inconsiderate and cruel voice in the crowd answered, "Bianca is no more!—she sleeps with her father in the church of Saint Theodore."

"No more!" moaned the young warrior, and his flushed face became pale as the monumental marble, and, but for his friends, he had fallen to the earth like one struck by lightning. When he partially recovered from the first shock, he again raised his eyes to the ladies' balcony; she was indeed not there—where she must have been had life and love animated her. That absence confirmed the truth of the ill-omened voice; his eyes dropped despondingly to the earth, where now in his youth and his glory he could have wished to see a grave open for himself. His old father fell on his neck, and wept aloud.

For some moments the mind of Gherardo wandered, and his soul was benumbed; but the sight of Alessio, the brother of Bianca, advancing through the crowd, recalled him to consciousness and anguish. "Is it even as they say?" cried he hoarsely, and stretching out his hand to his friend. Alessio grasped his hand with one of his, and dashing away the tears from his averted face with the other, he replied in a suffocated voice, "Alas! and alas! it is even so—Bianca expired yesterday; and as the galley, your precursor, was appearing, my sister was on her road to the sepulchre!"

Such irremediable woe where so much bliss was expected—such an awakening from all the ecstatic dreams and aspirations that had given him strength in battle, and cheered him over the tedious or stormy waves—such a return—such a welcome—such an end to all his fond and passionate hopes, was not to be supported.

With a deep groan he swooned away, and the young hero, so lately the happiest among the happy—the most animated where all were animated—was borne in a lifeless state to the sad halls of his father.

It was long ere he returned to life and reason, and, oh! how dreadful was his return to the latter! He would have given the world for some opiate or drug capable of repelling thought and recollection. He closed his eyes to the gay light of the sun—he would have shut out its rays for ever! He was deaf to the assiduous advice and consolation of his friends who thronged about him—he was mute too, and asked not a single question as to the malady or disease of his bride. Was it not enough to know that she was for ever torn from him—dead!—what mattered the mode or the circumstances that had led to such a fearful result? At last he spoke, but it was only to request his father that he might be left alone. The afflicted signior, with words of affectionate condolence, and prayers that his son would raise his thoughts to the contemplation of that Being in whose hands were life and death, and to whose omnipotent will it was his duty to submit, left the room with tears, and was followed by all the company. When, in the silence and solitude of his own chamber, Gherardo looked around him, he felt more than ever the extent of his loss. He rose from the couch on which he had been reclining, and advanced to a curtained recess at the end of the room—he drew the curtains—the sight was a cruel one! There was the *talamo* or splendid nuptial bed his friends had prepared and decorated for his return—there, on the rich velvet and the flowing silk, were the embroidered rose-wreaths mixed with the laurel crowns, and the initials of his name entwined with those of the name of his Bianca. And hungry death was feeding on her roses, and her name, in the mouths of men, had become a note of woe—in his ear a sound of despair! He threw himself on the ground at the bed's foot, and, burying his burning face in his hands, gave vent for the first time to a copious flood of tears.

As thus he lay, humbled in the dust, with all his thoughts in the dark and narrow grave, the sun shone brightly on Venice, and her thronging thousands, replete with joy, sang their songs of triumph, and shouted the names of their gallant warriors and the captains of their galleys. It could not be that *his* should be forgotten, for who had borne himself more bravely than he? And as a crowd passed in front of his paternal abode, their united voices proclaimed, "Gherardo! Gherardo! Long life and glory to Gherardo, the soldier of St Mark!" The sounds struck his ears, but now they could elicit only a bitter smile.

The passing hours did not restore tranquillity to the bereft bridegroom; but as the shades of night descended, a wild idea, an uncontrollable impulse, invaded him. "And shall my fond eyes obtain not a last glance of that being of love and beauty? Shall my Bianca," reasoned the passionate youth (if such movement of the feelings can be called reason)—"my betrothed, be consumed by vile worms, and I not see the loveliness she must have carried to the grave? She died but yesterday—she must still be beautiful! Yes! I will see her once again! I will once again press those lips, though they be cold—cold!"

At a late hour he secretly left his father's house for the well-known church—alas! he was to have been married there! A handful of gold gained over the *sacristano*, who unlocked the door of the temple and retired. Gherardo stood alone, a few paces from Bianca's tomb. A few lamps burned here and there, dimly, before the effigies of the Virgin Mother and of the most conspicuous saints; the moon shed an uncertain light through the painted glass of the lofty and narrow Gothic windows; but away among the massy columns, and through the long aisles of the church, there fell the obscurity of "the valley of the shadow of death;" and sounds there were none, save the fast-coming sighs of the hapless lover. The hour, the spot, the awful stillness, were all calculated to overpower the mind with indescribable emotion; the age was one of extreme superstition, and our young soldier's philosophy had not taught him to rise superior to the popular credence; the state of his feelings too—and nothing is more imaginative or creative of ideal horrors than a certain stage of grief—contributed to delude the senses; and as the cressets trembled, and the moonlight, strangely coloured by the stained glass through which it passed, gleamed now brighter, and now fainter—now resting on this object of somewhat grotesque architecture of the church, now on that—he saw, or fancied the spirits of the departed rising one by one, and mournfully waving their hands, as if warning him against a sacrilegious intrusion on the regions of the dead. Through the postern door by which he had entered, and which the *sacristano* had left ajar, there suddenly blew a gust of the fresh night-breeze, that, moaning among the columns and over the hollow marble pavement of the church, sounded in his ear like a voice, but not of earth—like the united lamentations of sad or guilt-burdened spirits. He clung to one of the pillars for support, and was for some moments incapable of motion. His natural courage, and the intenseness of the feeling and purpose that had brought him thither, soon, however, came to his aid, and he strode with hasty steps to the cappella, or lateral recess of the temple, beneath which was the tomb of the bride's family. Here, in this deep recess, the moon could not shed a beam; but he was guided to the door of the sepulchre by a lamp that flickered on the altar of the cappella. Hurried,

breathless, he laid his hand upon that door; massy, and bound with heavy iron and with bronze, it required a great effort to open it—he pressed his muscular shoulder against it—it receded; but as it turned on its unwilling hinges, it produced a hoarse rumbling sound that echoed like thunder in the vault beneath, and caused him to start back with trembling limbs and cold sweat on his brow. Again, however, desperation—love—the determination to see the lifeless form of his beloved, conquered his awe and the repugnance for disturbing the peace of the grave: yet he paused, ere he plunged into the horrible, palpable obscurity that lay beyond the door of the tomb, and crossing himself, murmured a prayer to the blessed Virgin who saw his woe, and might pity or pardon his sacrilegious audacity. He then rushed down a few steps through a short dark passage, and, himself like a spectre, entered the narrow chamber of death. A lamp beneath a crucifix burned at the head of the avello or sarcophagus of Bianca, and a grated window near the roof of the vault admitted the rays of the moon, that fell almost perpendicularly on that cold white marble. He grasped at once the heavy cover of the coffin—had he hesitated, he might have been effectually deterred from completing his sad, wild enterprise. His nervous arms removed the weight, and then his eyes rested on the shrouded form of his Bianca, whose head was enveloped in a veil of pure white, and her “decent limbs composed” beneath an ample white robe. His brain reeled at the sight, and the lamp which he had grasped fell from his hand. When he recovered strength to proceed, the light from the grated window fell full in the open coffin; and as his trembling hands withdrew the veil, a clear broad ray of the moon illumined the face of his lovely bride.

“And could this be death? Why, even thus she looked when life and love coursed through her young veins!—even thus, when after a day of joy she slept a balmy sleep, a night of peace! And were not the long loose tresses crossed on her innocent bosom the same as erst—and the pale smooth brow, and the broad eyelids, with their long black fringes, and the cherub mouth, with lips slightly apart, as if smiling in some blissful dream. “No, this cannot be death!” cried Gherardo, deliriously; “she sleeps! Oh wake!—in pity, wake, my Bianca—my love, my wife! He was silent for a moment, and gazed on her beautiful moon-lit countenance, as if expecting she would really rise at his passionate abjuration. “Bianca!” continued he, “my own Bianca!—why dost thou slumber thus!—dost thou await the warm kisses of thy lover to awaken thee? I give thee thee!”—and throwing himself across the marble coffin, he pressed his quivering lips to hers. But how did his whole soul rush to his mouth, when he fancied he felt the breath of life on those pale lips! He pressed them again—if it was a delusion, it continued—for the mildest, the most subdued of breathings, seemed to pass from her lips to his. He raised her from the sarcophagus—he placed his hand on her heart—and language has no power to paint his emotions, when he felt—plainly felt—that heart palpitate beneath his hand. Another moment, and her eyes opened, whilst a low murmur escaped her lips. Gherardo clasped her wildly in his embrace, and leaned for support against the sarcophagus, where, as they stood, mute, motionless, and pale, almost like statues, in the moonlight, it would have been difficult to tell which of the two, or whether both, had not been awakened from the sleep of death.

The chronicler's tale is told. The ignorance of the physicians, and the immediate sepulture after death usual in the south, had consigned Bianca to the grave, from which the passion and impetuosity of her lover saved her so opportunely. The fair Venetian passed almost at once from the marble sarcophagus to the nuptial bed of silk and velvet. The church, where the echoes of her funeral dirge might almost seem yet to linger, pealed with the notes of her hymeneals; and her bridal coronet of white roses was supplied by the tree that had furnished flowers for her funeral.”

THE ORIGINAL OF LAWRIE TOD.

WHILE Mr Fergusson was on his visit to New York in 1831, he mentions in his “Notes” that he frequently visited the seed-store of Mr Thorburn, a character of some celebrity, and of great originality, being, as he informed him at the first interview, the “very identical *Laurie Tod*,” and that so far as the first volume of that entertaining work goes, Mr Galt had exactly recorded his life and adventures. Besides other sources of enjoyment (continues Mr Fergusson), Mr Thorburn is distinguished for a lively and unflinching reliance upon a special overruling Providence—not a blind fatalism, but a conviction that, in all the crosses of life, a blessing will be found by those who faithfully seek it. He detailed many singular illustrations of this doctrine in his own history, and altogether gratified me much by his acquaintance. His original profession was that of a nail-maker at Dalkeith, and by that alone he looked for a livelihood in the New World. Soon after his arrival, however, this handicraft was annihilated by the introduction of machinery, and poor Thorburn was driven to open a small grocery store for subsistence to *Phemie* and himself. It was his practice to visit the butcher-market at a late hour,

that he might pick up a cheap morsel; and observing a man offering plants for sale in pots, and seemingly, like himself, rather low in the world, Thorburn accosted him; he proved to be a countryman—an industrious but rather unsuccessful market-gardener, of the name of Inglis, from Kirkcaldy; and, from a sort of commiseration, Thorburn bought a rose geranium, intending to ornament his shop. At this time he scarce knew a geranium from a cabbage. Pleased with his purchase, when he got home he painted his pot a gay green, and placed it in his window. “And now,” says he, when he told me this story, with his eyes twinkling, “mark the kindness of Providence. The day after my geranium appeared in its new pot, a lady happening to drive past, remarked its beauty, and not only bought it at a handsome price, but gave me such orders as enabled me to open a busy trade with poor Inglis. My shop soon became more celebrated for plants than for tea and tobacco; and many inquiries having been made for garden-seeds, I procured an assortment, and gradually extended my concern, until I reached the possession of the handsome premises and flourishing trade which I now enjoy.” Some of his details, regarding the devastations occasioned by the yellow fever, were extremely interesting. He has a very beautiful seed-shop, aviary, and green-house, &c. in the centre of the city, formerly a Quakers’ meeting-house and school, where he seems to have a thriving trade. The ladies of New York are fond of flowers, and use them much in dress. Camellias are in great request, and sometimes sell so high as three dollars a-head—the ordinary price being one—and large orders are given for every party. I learned also, from a Scotchman in Mr Thorburn’s employment, whose family had suffered heavily from sickness last winter, that camellias and parties by no means engross the whole attention of the ladies of New York. He assured me, that within his own observation, it was quite wonderful what they contrive to do, in visiting, clothing, and attending to the poor.

CURIOUS HISTORY OF AN EDINBURGH BOY.

THE following facts respecting John Oswald, who may almost be termed a second Paul Jones, are here related for the first time, and may be depended upon as quite authentic. He was the son of a goldsmith in Edinburgh, and is believed to have been brought up to the same business. Through the impulse of an unsettled disposition, he enlisted in the 18th or Royal Irish regiment. Here his good education soon caused him to be elevated to a serjeantcy. When quartered at Deal, he married a native of the place, with whom he got a sum of money sufficient to purchase his discharge, as well as the commission of an ensign in the 42d, then in America, which regiment, however, he never joined. In 1780, when the 2d battalion was raised, he obtained a lieutenancy in it, and went out to India. On the passage out in 1781, when Commodore Johnston’s squadron lay at anchor in Praga Bay, he fought a duel with the officer commanding the two companies in the transport, in which he was not the aggressor; they fired two rounds at each other, luckily without bloodshed. His finances not permitting him to join the mess on board the transport, he lived upon the same rations that were served out to the soldiers. He devoted the most of his time to the study of the Latin and Greek languages, particularly the latter, in the course of which he became enamoured of the republican form of government. He sold out in 1782, before the regiment had become engaged in actual service. During his short stay in India, he imitated the Gentoos, by abstaining from animal food, regularly performing the prescribed ablutions, and anointing his body with oil. He returned home overland, and took up his residence in London, where he chiefly supported himself, it is believed, by his pen. He wrote both in verse and prose. In one of his productions styled “*Rana Evangelica*, or the Frogs turned Methodists,” he expressed himself in language which could only have been used by a perfect infidel. His religious notions, indeed, had always been loose; and it is also to be remarked, that, though a devoted admirer of liberty and equality in the abstract, he was himself inclined to be arbitrary and tyrannical, of which he gave a convincing proof when at one time doing the duty of an adjutant—his treatment of the men had almost excited a mutiny. When the French revolution broke out, he repaired to France, and entering keenly into the spirit of the time, obtained the command of a regiment in the service of the Convention, at the head of which, either in the Chouan or Vendean war, he was killed along with two of his sons, who, in the true spirit of liberty and equality, were drummers in the corps which their father commanded. Oswald’s appearance in the French service had excited some attention in his own country, and it is a somewhat curious fact that an attempt was made to prove his identity with Bonaparte. The well-known Dr William Thomson, a Scotchman driving the trade of an author in London, and who completed the life of Philip of Spain, left unfinished by Dr Watson of St Andrew’s, had prepared a work in which he seriously attempted to prove that the First Consul’s real name was John Oswald, and that he was the son of a goldsmith in Edinburgh. Oswald, he argued, was a man of enterprise and courage, and a great admirer of Ossian’s Poems, as was also, he said, Bonaparte. Upon this slender foundation, the doctor had contrived to rear a great superstructure of argument and conjec-

ture, which might have made an impression where Bonaparte’s early history was not known. He was prevented, however, from publishing his theory, in consequence of a discovery made by the person who communicates this information. Our informant happened to dine with General Paoli on the very day after he had heard Dr Thomson read his manuscript; when the general mentioned that he not only knew Bonaparte’s early history perfectly well, but had actually held him up at the baptismal font. He was much amused, however, at hearing the arguments employed to prove his identity with the Edinburgh goldsmith’s son.—*Edinburgh Advertiser*.

EDINBURGH JESTS AND ANECDOTES.

EDINBURGH LAWYERS.

The Edinburgh lawyers of the last age were a race very much addicted to hard drinking. Drinking indeed intruded itself into every scene of their lives; and as much of their business was necessarily performed in taverns, on account of the wretched accommodations of their own houses in the Old Town, the ink-glass and the claret-stoup were alike dear to them; and they could scarcely attempt to take a supply from the one, but the pen was in danger of being immersed in the other. These habits clung to them till a very recent period, as some anecdotes of men still alive will testify.

A gentleman now retired from public life, but who will be long remembered for his talent of saying good things, was one night engaged with a judge in a tremendous boose, which lasted all night, and till within a single hour of the time when the court was to meet next morning. The two cronies had little more than time to dress themselves in their respective houses, when they had to meet again, in their professional capacities of judge and pleader, in the Parliament House. Mr C—, it appears, had in the hurry of his toilet thrust the pack of cards he had been using over night into the pocket of his gown; and thus, as he was about to open the pleadings, in pulling out his handkerchief, he also pulled out fifty-two witnesses of his last night’s debauch, which fell scattered within the bar. “Mr C—,” said his judicial associate in guilt, with the utmost coolness, “before you begin, I think ye had better tak up your hand.”

An equally wet and witty barrister one Saturday encountered an equally Bacchanalian senatorial friend in the course of a walk to Leith. Remembering that he had a good jigot of mutton roasting for dinner, he invited his friend to accompany him home; and they accordingly dined together *secundum morem solitum*. After dinner was over, wine and cards commenced; and as the two friends were alike fond of each of these recreations, neither ever thought of reminding the other of the advance of time, till next day, as it happened, about a quarter before eleven o’clock. The judge then rising to depart, Mr — walked behind him to the outer door, with a candle in each hand, by way of showing him out. “Tak care, my lord, tak care,” cried the kind host, most anxiously holding the candles out of the door into the sunny street, along which the people were pouring churchwards; “tak care; there’s twa steps.”

The taverns to which Edinburgh lawyers of those days resorted were generally very obscure and mean—at least such they would now appear; and many of them were so peculiarly situated in the profound recesses of the old town as to have no light from the sun, so that the inmates had to use candles continually. A small party of legal gentlemen happened one day to drop into one of these dens; and as they sat a good while drinking, they at last forgot the time of day. Taking their impressions from the candles, they just supposed that they were enjoying an ordinary evening debauch. “Sirs,” said one of them at last, “it’s time to rise: ye ken I’m a married man, and should be early at hame.” And so they all rose, and prepared to stagger home through the lamp-lighted streets; when, lo and behold! on their emerging from the tavern, they suddenly found themselves projected into the blaze of a summer afternoon, and, at the same time, under the gaze of a thousand curious eyes, which were directed with surprise to their tipsy and negligent figures. How they got home, under such circumstances, through a crowd of sober and unsympathising spectators, is left to the imagination of the reader.

PLAGIARISM.

One legal gentleman of Edinburgh, having showed another a quantity of poems which he had written, and of which he wished to have the opinion of his friend, the referee glanced over the manuscript, but was quickly struck with the extensive and wholesale plagiarisms which he saw had been committed upon the classical writers of Greece and Rome. Pointing out this to his friend, “Oh,” said the poet, “I am something of Fielding’s opinion, as expressed in *Tom Jones*, that the ancients are a common property, where every modern poet is entitled to pasture his Pegasus.” “Ay, man,” responded the critic, with a happiness of thought which, unfortunately, none but a Scotch lawyer can appreciate to its full extent, “your title may give you a *servitude of pasture* upon the common property of the ancients, but, surely, ye never gat ane of *feal and divot*.”

THE AUTHOR OF WAVERLEY.

Mrs Murray Keith, a venerable Scotch lady, from whom Sir Walter Scott derived many of the traditional stories and anecdotes wrought up in his admi-

* The above beautifully written tale, by Mr Mac Farlane, is abridged and extracted from a recent volume of the *Friendship’s Offering*—an Annual distinguished for the literary ability of its pages.

rabble fictions, taxed him one day with the authorship, which he, as usual, stoutly denied. "What!" exclaimed the old lady, "d'ye think I dinna ken my ain groats among other folk's kail?"

MOTS OF SIR WALTER SCOTT.

An English lady and gentleman, who, in travelling through Scotland, had come to the neighbourhood of Abbotsford without providing themselves with an introduction to Sir Walter Scott, and who felt, when there, an irresistible inclination to intrude upon him, could think of no expedient by which to gratify their curiosity, but that of throwing themselves upon his mercy, and begging the favour of an interview. In their card to him, they said that, in coming to Scotland, their chief object had been to see "the great Lion of the North, Sir Walter Scott;" and they begged him to consider how hard it would be, if, after all their travels, they should have to go home disappointed. Sir Walter immediately returned an answer, couched in the most polite terms, and concluding with a request that they would come that day to dine with him, "as he had some reason to believe the Lion of the North, like his friends at Exeter Change, was best worth seeing at feeding time."

GOOD BOOK-KEEPERS.

Sir Walter, in lending a book one day to a friend, cautioned him to be punctual in returning it. "This is really necessary," said the poet in apology; "for though many of my friends are bad arithmeticians, I observe almost all of them to be good book-keepers."

MEN WITH TAILS.

Every body in Scotland has heard of the single absurdity which deformed the philosophical character of Lord Monboddo—his belief that the human race were originally gifted with tails, which were only pinched off by the midwives. Lord Kaimes was a complete contrast in manners to this learned judge, being plain, and blunt of speech, with a strong Scottish accent; while Monboddo was quite a courtier of the *ancien régime*, well bred and ceremonious. On one occasion, in Edinburgh, when Kaimes and Monboddo went to dine with a friend, a girl of six or seven years old, who was in the drawing-room, archly and slyly attached a fox's brush to Monboddo's skirt; and the ceremony of who should first proceed to the dining-room, as usual, produced some demur, Monboddo insisting that he could not possibly precede a *senior* lord, till Kaimes, spying the trick which had been played on his friend, exclaimed, "Gang in, man, and show's your tail!" pushing him forward. Of course the laugh was irresistible, but Monboddo could not enjoy it, as, through fear of giving him offence, he was not informed of the joke.—*Chambers's Scottish Jests.*

RUSSIAN LITERATURE.

ACCORDING to Dr Granville, a recent traveller, Russian literature, since the appearance of its reformer and most brilliant star, Lantovosoff, has been rapidly improving in all its branches. In the severer style of prose, the death of Karamsin has left a chasm which will not readily be filled up. Karamsin is unquestionably the greatest historian that the Russians possess, and his name will rank deservedly high among historical writers of modern times. The writers in the belles-lettres, since the beginning of the present century, have made advances in correctness of style and purity of diction, which have rendered the study of the Russian language an almost fashionable attainment. In poetry the Russians have made rapid progress, especially in the lyric department. Alexander Pouchkine is considered the Byron of Russia, and is noted for the precocity of his genius. The Russians are indebted to him for a translation of Shakespeare's *King Lear*. The fabulists have been numerous in Russia. The romantic school, which has endeavoured to spread its dominion in all the most civilised parts of Europe within the last twenty years, boasts of a few distinguished writers, even in Russia. Eugene Baratinsky is one of the most eminent among them. Among the more modern living poets, the fair sex boasts of Mademoiselle Zenaïde Volkouski. In dramatic literature, very little originality, and many indifferent imitations or translations, exist at present. Prince Chakhousky claims the united titles of a prolific *vaudeville* and comedy writer, and of a fertile and elevated tragedian. Zagoskine is another modern dramatic author of great power and originality of humour. Of translators from the French the number is considerable. It may be stated, that in literature the Russians have made more rapid progress within the last fifty years, than in the other branches of knowledge. According to the report of M. Sopikoff, it appears, that although the art of printing was introduced in Russia one hundred and fifty years after its invention, and eighty after its introduction by Caxton in England, not fewer than 80,000 volumes in the Slavonic and Russian languages have been published between 1551 and 1813. The printers of St Petersburg execute their work in a style equal to the French. The press in Russia, as in most parts of the Continent, is subject to a board of censure; but this does not seem to have impeded the publication of a considerable number of works in modern times, and men of letters have received great encouragement from the present emperor. St Petersburg has advanced greatly as a mart of literature, and sends forth a large number of periodical publications.

CHARACTERISTIC SKETCHES.

AUDUBON.

THE intelligent and enterprising AUDUBON, whose researches in natural history in his native country, America, have conferred upon him an honourable distinction, presents us, in the course of the details in his Ornithological Biography, with a variety of interesting personal adventures, one of which I shall extract for the amusement of my readers. It seems, that, like many men of genius, this agreeable writer was sometimes in great straits, and underwent divers misfortunes, which would certainly have cooled the ardour of ordinary minds; but when such occurred to Audubon, he became only the more zealous in his pursuits, and doubled his exertions to release himself from his difficulties.

"My money (says he) was one day stolen from me by a person, who perhaps imagined that to a naturalist it was of little importance. This happened on the shores of Upper Canada. The affair was as unexpected as it well could be, and as adroitly managed as if it had been planned and executed in Cheapside. To have repined when the thing could not be helped, would certes not have been acting manfully. I therefore told my companion to keep a good heart, for I felt satisfied that Providence had some relief in store for us. The whole amount of cash left with two individuals, fifteen hundred miles from home, was just seven dollars and a half. Our passage across the lake had fortunately been paid for. We embarked and soon got to the entrance of Presque Isle Harbour, but could not pass the bar, on account of a violent gale which came on as we approached it. The anchor was dropped, and we remained on board during the night, feeling at times very disagreeable, under the idea of having taken so little care of our money. How long we might have remained at anchor I cannot tell, had not that Providence, on whom I have never ceased to rely, come to our aid. Through some means to me quite unknown, Captain Judd, of the United States navy, then probably commandant at Presque Isle, sent a gig with six men to our relief. It was on the 29th of August 1824, and never shall I forget that morning. My drawings were put into the boat with the greatest care. We shifted into it, and seated ourselves according to directions politely given us. Our brave fellows pulled hard, and every moment brought us nearer to the American shore. I leaped upon it with elated heart. My drawings were safely landed, and for any thing else I cared little at the moment. I searched in vain for the officer of our navy, to whom I still feel grateful, and gave one of our dollars to the sailors to drink the 'freedom of the waters,' after which we betook ourselves to a humble inn, to procure bread and milk, and consider how we were to proceed.

Our plans were soon settled, for to proceed was decidedly the best. Our luggage was rather heavy, so we hired a cart to take it to Meadville, for which we offered five dollars. This sum was accepted, and we set off. The country through which we passed might have proved favourable to our pursuits, had it not rained nearly the whole day. At night we alighted and put up at a house belonging to our conductor's father. It was Sunday night. The good folks had not yet returned from a distant meeting-house, the grandmother of our driver being the only individual about the premises. We found her a cheerful dame, who bestirred herself as actively as age would permit, got up a blazing fire to dry our wet clothes, and put as much bread and milk on the table as might have sufficed for several besides ourselves.

Being fatigued by the jolting of the cart, we asked for a place in which to rest, and were shown into a room in which were several beds. We told the good woman that I should paint her portrait next morning for the sake of her children. My companion and myself were soon in bed, and soon asleep, in which state we should probably have remained till morning, had we not been awakened by a light, which we found to be carried by three young damsels, who having observed where we lay, blew it out, and got into a bed opposite ours. As we had not spoken, it is probable the girls supposed us sound asleep, and we heard them say how delighted they would be to have their portraits taken, as well as that of their grandmother. My heart silently met their desire, and we fell asleep without farther disturbance. In our back woods it is frequently the case that one room suffices for all the sleepers of a family.

Day dawned, and as we were dressing we discovered that we were alone in the apartment, the good country girls having dressed in silence, and left us before we had awakened. We joined the family, and were kindly greeted. No sooner had I made known my intentions as to the portraits, than the young folks disappeared, and soon after returned attired in their Sunday clothes. The black chalk was at work in a few minutes, to their great delight; and as the fumes of the breakfast that was meantime preparing reached my sensitive nose, I worked with redoubled ardour. The sketches were soon finished, and soon too was the breakfast over. I played a few airs on my flageolet, while our guide was putting the horses to the cart, and by ten o'clock we were once more under way towards Meadville. Never shall I forget Maxon Randell and his hospitable family. My companion was as pleased as myself; and as the weather was now beautiful, we enjoyed our journey with all that happy thoughtlessness best suited to our character. The country now

became covered with heavy timber, principally evergreens, the pines and the cucumber trees loaded with brilliant fruits, and the spruces throwing a shade over the land in good keeping for a mellow picture. The lateness of the crops was the only disagreeable circumstance that struck us; hay was yet standing, probably, however, a second crop; the peaches were quite small and green, and a few persons here and there, as we passed the different farms, were reaping oats. At length we came in sight of French Creek, and soon after reached Meadville. Here we paid the five dollars promised to our conductor, who instantly faced about, and applying the whip to his nags, bade us adieu, and set off.

We had now only a hundred and fifty cents. No time was to be lost. We put our baggage and ourselves under the roof of a tavern-keeper known by the name of J. E. Smith, at the sign of the *Traveller's Rest*, and soon after took a walk to survey the little village that was to be laid under contribution for our farther support. Its appearance was rather dull; but, thanks to God, I have never despaired while rambling thus for the sole purpose of admiring his grand and beautiful works. I had opened the case that contained my drawings, and putting my portfolio under my arm, and a few good credentials in my pocket, walked up Main Street, looking to the right and left, examining the different heads which occurred, until I fixed my eyes on a gentleman in a store who looked as if he might want a sketch. I begged him to allow me to sit down. This granted, I remained purposely silent, until he very soon asked me what was "in that portfolio." These three words sounded well; and without waiting another instant, I opened it to his view. This was a Hollander, who complimented me much on the execution of the drawings of birds and flowers in my portfolio. Showing him a sketch of the best friend I have in the world at present, I asked him if he would like one in the same style of himself. He not only answered in the affirmative, but assured me that he would exert himself in procuring as many more customers as he could. I thanked him, he assured, kind reader; and having fixed upon the next morning for drawing the sketch, I returned to the *Traveller's Rest*, with a hope that to-morrow might prove propitious. Supper was ready, and as in America we have generally but one sort of *table d'hôte*, we sat down, when every individual looking upon me as a missionary priest on account of my hair, which in those days flowed loosely on my shoulders, I was asked to say grace, which I did with a fervent spirit.

Daylight returned. I visited the groves and woods around, with my companion, returned, breakfasted, and went to the store, where, notwithstanding my ardent desire to begin my task, it was ten o'clock before the sitter was ready. But, reader, allow me to describe the *artist's room*. See me ascending a crazy flight of steps, from the back part of a store-room, into a large garret extending over the store and counting-room, and mark me looking round to see how the light could be stopped from obtruding on me through no less than four windows facing each other at right angles. Then follow me scrutinising the corners, and finding in one a cat nursing her young, among a heap of rags intended for the paper-mill. Two hogsheds filled with oats, a parcel of Dutch toys carelessly thrown on the floor, a large drum and a bassoon in another part, fur caps hanging along the wall, and the portable bed of the merchant's clerk swinging like a hammock near the centre, together with some rolls of sole leather, made up the picture. I saw all this at a glance, and closing the extra windows with blankets, I soon procured a *painter's light*.

A young gentleman sat, to try my skill. I finished his phiz, which was approved of. The merchant then took the chair, and I had the good fortune to please him also. The room became crowded with the gentry of the village. Some laughed, while others expressed their wonder; but my work went on notwithstanding the observations that were made. My sister invited me to spend the evening with him, which I did, and joined him in some music on the flute and violin. I returned to my companion with great pleasure; and you may judge how much that pleasure was increased, when I found that he also had made two sketches. Having written a page or two of our journals, we retired to rest.

The following day was spent much in the same manner. I felt highly gratified that from under my grey coat my talents had made their way, and I was pleased to discover that industry and moderate abilities prove at least as valuable as first-rate talents without the former of these qualities. We left Meadville on foot, having forwarded our baggage by waggon. Our hearts were light, our pockets replenished, and we walked in two days to Pittsburg, as happy as circumstances permitted us to be.

CONSUMPTION OF SILK.

The quantity of this material used in England alone amounts each year to more than four millions of pounds weight, for the production of which myriads upon myriads of insects are required. Fourteen thousand millions of animated creatures annually live and die to supply this corner of the world with an article of luxury! If astonishment be excited at this fact, let us extend our view into China, and survey the dense population of its widely-spread region, whose inhabitants, from the emperor on his throne to the peasant in the lowly hut, are indebted for their clothing to the labours of the silkworm. The imagination, fatigued with the flight, is lost and bewildered in contemplating the countless numbers, which every successive year spin their slender threads for the service of man.—*Lardner.*

STATE OF SPAIN.

THE greater part of the land of Spain belongs to the nobility, the church, and towns, or corporate bodies. The destructive influence of this vast accumulation of property in a few hands, and of the alienable tenures under which it is principally held, have been forcibly described by Mr Townsend (vol. ii. p. 237), and by Jovellanus in his invaluable Memoir on the Advancement of Agriculture, drawn up in 1795. Throughout the principal part of the country, agriculture is in the most wretched state imaginable. None, or next to none, of the lands in Leon, Castile, Estremadura, and Andalusia, are enclosed; a circumstance which may be ascribed partly to the carelessness and ignorance of the proprietors, partly to the poverty of the occupiers, and partly, and principally perhaps, to the destructive privilege enjoyed by the proprietors of the great sheep-flocks, of driving them from the provinces in the north to those in the south for winter pasture. The *mesta* or code of laws with respect to the migration of the flocks, is assuredly one of the most oppressive and ruinous that ever has been devised. Enclosures have been prohibited, that the migration of the flocks might not be interrupted; in some provinces it was even forbidden to convert any pasture land into tillage; and it was only so late as 1788 that individuals occupying lands in the track of the flocks were authorised to enclose kitchen gardens, and grounds appropriated to the culture of vines and seeds. Estremadura has suffered particularly from this scourge. Farms throughout Spain are small, with hardly an exception, and the farmers are in a state of unexampled misery. Notwithstanding the lowness of the rents, and the cheapness of living—for they generally live worse than the labourers in the town—they are unable to make the smallest advances on account of their farming operations, and are obliged to raise whatever funds they require by mortgaging their crops. This is not only true of tillage farmers, but also of the growers of oil and wine, who frequently cede the anticipated produce of their lands for less than three-fourths of its value. Farmhouses are rarely seen except along the east coast. The farmers live in huts of the meanest construction, crowded together in villages, so that farm buildings, often so expensive in other countries, cost almost nothing. The operations of treading (thrashing) and cleaning the corn, are performed in the open air, and the grain is left in heaps in the field until it can be sold. The corn speculators and proprietors of Castile have caves dug in the rock or the earth, in which the grain is preserved until a market opens for it; being often kept in this way for five or six years without much loss. The implements used in husbandry are of the rudest description, especially in Old Castile and Leon, where the soil is sandy and easily cultivated. In Andalusia, and along the coast of the Mediterranean, where the soil is more tenacious, implements of a better description are in use, but they are still very rude indeed, compared to those employed in Britain.—*Foreign Quarterly Review*.

A FEMALE BRAZILIAN SOLDIER.

In the Journal of a Voyage to Brazil, written a few years ago by Maria Graham, we are presented with a singular instance of female heroism, in the notice which is taken of a young woman, who for patriotic motives voluntarily took up arms and assumed the military garb and occupation. To-day (says the authoress) I received a visit from Donna Maria de Jesus, the young woman who has lately distinguished herself in the war of the Reconquest. Her dress is that of a soldier of one of the emperor's battalions, with the addition of a tartan kilt, which she told me she had adopted from a picture representing a Highlander, as the most feminine military dress. What would the Gordons and Macdonalds say to this! The "garb of old Gaul" chosen as a womanish attire? Her father is a Portuguese, named Gonsalvez de Almeida, and possesses a farm for cattle. Her mother also was a Portuguese. Donna Maria told me several particulars concerning the country, and more concerning her own adventures. It appears that early in the late war of the Reconquest, emissaries had traversed the country in all directions, to raise patriotic recruits; that one of these had arrived at her father's house one day about dinner time; that her father had invited him in, and after their meal he began to talk on the subject of his visit. He represented the greatness and riches of Brazil, and the happiness to which it might attain, if independent. He set forth the long and oppressive tyranny of Portugal, and the meanness of submitting to be ruled by so poor and degraded a country. He talked long and eloquently of the services Don Pedro had rendered to Brazil; of his virtues, and those of the empress; so that at last, said the girl, "I felt my heart burning in my breast." Her father, however, had none of her enthusiasm of character. He is old, and said he neither could join the army himself, nor had he a son to send thither; and as to giving a slave for the ranks, what interest had a slave to fight for the independence of Brazil? He should wait in patience the result of the war, and be a peaceable subject to the winner. Donna Maria stole from home to the house of her own sister, who was married, and lived at a little distance. She recapitulated the whole of the stranger's discourse, and said she wished she was a man, that she should join the patriots. "Nay," said the sister, "if I had not a husband and children, for one half of what you say I would join the ranks of the emperor." This was enough. Maria received some clothes belonging to her sister's husband to equip her; and as her father was then about to go to Cachoeira to dispose of some cottons, she resolved to take the opportunity of riding after him; near enough for protection in case of accident on the road, and far enough off to escape detection. At length, being in sight of Cachoeira, she stopped; and going off the road, equipped herself in male attire, and entered the town. This was on Friday. By Sunday she had managed matters so, that she had entered the regiment of artillery, and had mounted guard. She was too slight, however, for that service, and exchanged into the infantry, where she now is. She was sent hither, I be-

lieve, with dispatches, and to be presented to the emperor, who has given her an ensign's commission and the order of the cross, the decoration of which he himself placed on her jacket. She is illiterate, but clever. Her understanding is quick, and her perceptions keen. I think, with education, she might have been a remarkable person. She is not particularly masculine in her appearance, and her manners are gentle and cheerful. She has not contracted any thing coarse or vulgar in her camp life, and I believe that no imputation has ever been substantiated against her modesty. One thing is certain, that her sex never was known until her father applied to her commanding officer to seek her. There is nothing very peculiar in her manners at table, excepting that she eats farinha with her eggs at breakfast and her fish at dinner, instead of bread, and smokes a cigar after each meal; but she is very temperate.

EMIGRATION.

I MADE out a rough estimate (continues Mr Fergusson, of a supposed investment in Michigan, and having submitted it to the correction of competent judges, acquainted with the present state of the district, it may perhaps be useful to insert it, especially as it applies also to much of Upper Canada.

Price of 160 acres, at 1½ dollar, is	200 dollars, or £45 0
Expense of seed, labour (say 150 acres), and rail fence, at 6 dollars	900 202 10
Harvesting at 2 dollars	300 67 10

Cost of dwelling-house, stables, &c.	800 180 0
--------------------------------------	-----------------

2200	£495 0
Returns.—Produce of 150 acres (20 bushels per acre), 3000 bushels, at 1s. per bushel	£675
Deduct 495	

£180 clear.

The dollar is taken at 4s. 6d. No allowance is made for maintenance, and it may be said that the expenses are underrated. The above estimate, however, is given upon pretty good data; and as the settler will certainly repeat the wheat crop for at least one or two seasons more without any deterioration, and becomes likewise free owner of land and houses, he may afford to double or treble that item, or to take a smaller return per acre, or a lower price per bushel, and still be very well off. The return was stated to me at 25 or 30 bushels per acre at an average, and a dollar was the price given last season without any particular excitement. The houses are of a superior description, the dwelling-houses being supposed to contain seven or eight rooms, with kitchen and other domestic offices attached.

A good deal of discussion took place before the Emigration Committee, upon the probability of settlers being able to refund a portion or the whole of the sums advanced by government on their account. Should there be any foundation at all for the statement I have here given, it is abundantly clear that Mr Wilmot Horton's expectations on that head may be very easily realised.

The tide of emigration is at present setting very strong into Michigan. It is stated in the Detroit Courier of 26th May last, "that the sales of public lands up to five o'clock yesterday, amounted to 20,700 dollars! On two several days they exceeded 5000; one day, 5600. The total amount in this district alone, since the 1st of March, is 48,727 dollars."

Products of Michigan.—The cotton plant, the grapevine, the sweet potato of Carolina, tomato and the egg-plant were successfully cultivated last year. The prune-tree, will be planted this season. The mulberry is becoming extensively cultivated.

The period cannot be remote when pauperism must become an object of anxious investigation, as it already is of deep solicitude to every well-wisher of his country, and must be followed up with measures of energy and decision adequate to the political and moral importance of the subject.

While it may well be esteemed a dubious policy to pamper population by any permanent system of encouragement, few thinking minds will deny that the existing pressure (whether it be an actual excess or not) ought to be forthwith removed, and with no farther delay than the discovery of a safe and practical vent may require.

Whether we contemplate the mass of wretchedness and sickening hopelessness in which thousands of well-meaning labourers and artisans are at this moment plunged, or the absorbing demands which their necessities occasion, by the amount of parish rates, all must concur in the anxious wish that some remedy may be ere long devised. We have written and said so much upon this subject, that, from the very attempts to throw in light, it has become marvellously mystified and confused. Neither is it to be concealed that considerable and conflicting difficulties exist, though, it is believed and hoped, none which patient investigation and a liberal policy may not overcome. It may be reasonably assumed that parishes distressed by rates will readily concur in a fair and final composition, which is to free them from a heavy and growing annual charge. Government, on the other hand, by receiving such funds, and making simple and economical arrangements, may not only relieve the pressure at home, but will also confer happiness and independence upon those who have unhappily occasioned the distress. Neither does it seem necessary to open the public purse for this desirable object; on the contrary, by a judicious selection of settlements, and reserving lots of government lands adjoining those devoted to emigrants, there can be little doubt that, in a few years, considerable sales may be effected. The man who finds himself and family comfortably and conveniently settled upon fifty or a hundred acres, will ere long be willing and able to pay for a like quantity, which has been left alongside of his farm, and in this way government may be amply reimbursed.

In regard to the question of place, Upper Canada would

seem, on many accounts, to be most appropriate; nor can I bring myself for a moment to put Van Dieman's Land, New Holland, &c. in competition. A pestilential and impure moral atmosphere hangs over these colonies, which will require a very long period to dispel; and although this can be certainly best effected by a wholesome infusion of character from home, it must prove a heavy sacrifice to those individuals who undertake the task. The climate, the soil, the accessibility of North America, with various other circumstances, offer nearly an assurance of success.

And now comes the important question for individual consideration, "Is emigration expedient or not?" This must be decided by circumstances, and every man must judge for himself. Of this, however, I think there can be no doubt, that either the moderate capitalist, or the frugal, sober, and industrious labourer or artisan, cannot fail of success. Fortunes will not be rapidly or even readily acquired; but it must be the settler's own fault, if he does not enjoy in large abundance every solid comfort and enjoyment of life, and rear around his table even a *forest* of "olive plants," without one single anxious thought regarding their future destination.

Here Mr Fergusson brings his valuable paper on Emigration to a conclusion, after having given more solid and useful information for those disposed to leave this country for America, than any other writer of a recent date; and the dissemination of which, in the present publication, it is hoped, may be of no small service in guiding emigrants to the "Land of Promise." From week to week, as space can be afforded, additional information will be presented on this important subject, both from Mr Fergusson's Notes of his Journey, which he gives in a subsequent number of the *Agricultural Journal*, and a variety of other accurate documents.

OLD AGE.

The great English lexicographer, near the close of life, when writing to a friend, says, "My diseases are an asthma and a dropsy, and, what is less curable, *senectus*." A few precepts (says Macaulay in his Medical Dictionary) how to lessen the inconveniences of this last disease, may not be without their use. In old age, the sensibility of the nervous system is diminished, the muscular fibres are less irritable, and many of the arteries are ossified and obliterated. The body is bent; and those who have been tall and graceful in their youth, stoop forward in old age more than others, from the shrinking of the cartilages that lie between the vertebrae. The body is lean, and tremulous on any exertion. The torpor of the system, and the fullness of the veins, are the chief predisposing to disease in old age. The perspiration is checked, probably from the obstruction of the smaller arteries; and old people are accordingly subject to asthma, habitual catarrh, and water in the chest. These are to be treated by the appropriate remedies, and, if possible, by warm clothing, and regulating the temperature of their apartments. How to lessen the inconveniences of old age, and the fullness of the veins, are the chief predisposing to disease in old age. These are to be treated by the appropriate

COLUMN FOR THE WORKING CLASSES.

RESULTS OF MACHINERY.

It is just possible that some of you will say, It matters not to us, the working men of England, whether the people of India sell us raw cotton or piece goods, or whether the trade in cotton amounts to one million a-year, or thirty-six millions. You may want to know how you individually, whether labourers or mechanics, are benefited by these changes, which look so large in figures. We will endeavour to tell you how you are benefited.

Of the cotton cloth made in England, three hundred and sixty million yards are exported, and three hundred and ninety-nine million yards are retained for home consumption. This was the state of the trade upon an average of years from 1824 to 1828. You are, doubtless, benefited very greatly, though indirectly, by the cotton cloth and the cotton yarn which go out of the country. The difference in the value between the raw cotton and the cotton yarn or cloth, is the price of your industry, and of the profits of capital, which sets your industry in motion. At that price you buy foreign produce, by which purchase you bring many articles of necessity and luxury within your reach. But this, you say, is a doubtful good. The good is not doubtful; but the objects which produce the good are spread over a large surface. We shall confine your attention, therefore, to one object.

Near twenty years after Arkwright had begun to spin by machinery, the price of a particular sort of cotton yarn much used in the manufacture of calico was thirty-eight shillings a-pound. That same yarn is now sold for between three and four shillings, or one-twelfth of its price forty years ago. If cotton goods were worn only by the few rich, as they were worn in ancient times, and even in the latter half of the last century, that difference of price would not be a great object; but the price is a very important object, when every man, woman, and child in the United Kingdom, has to pay it. The four hundred million yards of cloth which are annually retained for home consumption, distributed amongst twenty-five millions of population, allow sixteen yards every year for each individual. We will suppose that no individual would buy these sixteen yards of cloth unless he or she wanted them; that this plenty of cloth is a desirable thing; that it is conducive to warmth and cleanliness, and therefore to health; that it would be a great privation to go without the cloth. At sixpence a yard, the four hundred million yards of cloth amount to ten million pounds sterling. At half-a-crown a-yard, which we will take as the average price about five and twenty years ago, they would amount to fifty million of pounds sterling—an amount equal to all the taxes annually paid in Great Britain and Ireland. At twelve times the present price, or six shillings a-yard, which proportion we get by knowing the price of yarn forty years ago and at the present day, the cost of four hundred million yards of cotton cloth would be one hundred and twenty million of pounds sterling. It is perfectly clear that no such sum of money could be paid for cotton goods, and that, in fact, instead of ten millions being spent in this article of clothing by persons of all classes, in consequence of the cheapness of the commodity, we should go back to very nearly the same consumption that existed before Arkwright's invention, that is, to the consumption of the year 1750, when the whole amount of the cotton manufacture of the kingdom did not exceed the annual value of two hundred thousand pounds. At that rate of value, the quantity of cloth manufactured could not have been equal to one five-hundredth part of that which is now manufactured for home consumption. So that thirty-one people each now consume sixteen yards of cotton cloth where one person eighty years ago consumed one yard. We ask you, therefore, if this vast difference in the comforts of every family, by the ability which they now possess of easily acquiring warm and healthful clothing, is not a clear gain to all society, and to every one of you as a portion of society. It is more especially a gain to the females and the children of your families, whose condition is always degraded when clothing is scanty. The power of procuring cheap clothing for themselves, and for their children, has a tendency to raise the condition of females more than any other addition to their stock of comfort. It cultivates habits of cleanliness and decency; and those are little acquainted with the human character who can doubt whether cleanliness and decency are not only great aids to virtue, but virtues themselves. John Wesley said that cleanliness was next to godliness. There is little self-respect amidst dirt and rags, and without self-respect there can be no foundation for those qualities which most contribute to the good of a society. The power of procuring useful clothing at a cheap price has raised the condition of women amongst us, and the influence of the condition of women upon the welfare of a community can never be too highly estimated. That the manufacture of cotton by machinery has produced one of the great results for which machinery is to be desired, namely, cheapness on production, cannot, we think, be doubted. If increased

employment of human labour has gone along with that cheapness of production, even the most prejudiced can have no doubt of the advantages of this machinery to all classes of the community.—*Working Man's Companion.*

STRENGTH OF IRON.

Experiments made to discover the resistance to tension possessed by malleable iron, have, as might be expected, produced various results. In the greater number of cases, 80,000 pounds to the square inch have been given; and in none when the material was sound, under 40,000 pounds; so that about 60,000 pounds may be taken as the average; and according to Tredgold, no material, as Emerson had previously concluded, should be put to more than a third or even a fourth of the weight that would break it. Generally it is admitted, that, besides the little interruption caused to the flow of the current by means of piers, and the slight interruption caused to the navigation of a river, as well as the saving of time, that one-half of the iron may be considered sufficient for the construction of a bridge on the suspension principle, that would be necessary for one on the ordinary plan. According to experiments made in Russia in 1824, to determine the tenacity of iron, it was found that the best iron supported twenty-six tons per square inch, without being torn asunder; whereas the worst iron gave way under a tension of fourteen tons to the square inch.—*Lardner.*

MAHOGANY.

There are three species of mahogany:—Common mahogany (*Swietenia mahagoni*), *Swietenia febrifuga*, and *Swietenia chlorocylon*; the first being a native of the West India islands and the central parts of America, and the second and third natives of the East Indies. They all grow to be trees of considerable magnitude, the first and second being among the largest trees known. They are all excellent timber. *Swietenia mahagoni* is perhaps the most majestic of trees; for though some rise to a greater height, this tree, like the oak and the cedar, impresses the spectator with the strongest feelings of its firmness and duration. In the rich valleys among the mountains of Cuba, and those that open upon the Bay of Honduras, the mahogany expands to so giant a trunk, divides into so many massy arms, and throws the shade of its shining green leaves, spotted with tufts of pearly flowers, over so vast an extent of surface, that it is difficult to imagine a vegetable production combining in such a degree the qualities of elegance and strength, of beauty and sublimity. The precise period of its growth is not accurately known; but as, when large, it changes but little during the life of a man, the time of its arriving at maturity is probably not less than two hundred years. Some idea of its size, and also of its commercial value, may be formed from the fact that a single log, imported at Liverpool, weighed nearly seven tons; was, in the first instance, sold for L.378; resold for L.525; and would, had the dealers been certain of its quality, have been worth L.1000. As is the case with much other timber, the finest mahogany trees, both for size and quality, are not in the most accessible situations; and as it is always imported in large masses, the transportation of it for any distance overland is so difficult, that the very best trees, both on the islands and on the mainland—those that grow in the rich inland valleys—defy the means of removal possessed by the natives. Masses of from six to eight tons are not very easily moved in any country; and in a mountainous and rocky one, where much attention is not paid to mechanical power, to move them is impossible. In Cuba, the inhabitants have neither enterprise nor skill adequate to felling the mahogany trees, and transporting them to the shore; and thus the finest timber remains unused. The discovery of this beautiful timber was accidental, and its introduction into notice was slow. The first mention of it is, that it was used in the repair of some of Sir Walter Raleigh's ships, at Trinidad, in 1597. Its finely variegated tints were admired; but in that age the dream of El Dorado caused matters of more value to be neglected. The first that was brought to England was about the beginning of the last century; a few planks having been sent to Dr Gibbons, of London, by a brother who was a West India captain. The doctor was erecting a house in King Street, Covent Garden, and gave the planks to the workmen, who rejected it as being too hard. The doctor's cabinetmaker, named Wollaston, was employed to make a candle-box of it; and as he was sawing up the plank, he also complained of the hardness of the timber. But when the candle-box was finished, it outshone in beauty all the doctor's other furniture, and became an object of curiosity and exhibition. The wood was then taken into favour: Dr Gibbons had a bureau made of it, and the Duchess of Buckingham another; and the despised mahogany now became a prominent article of luxury, and at the same time raised the fortunes of the cabinetmaker by whom it had been at first so little regarded.—*Library of Entertaining Knowledge.*

LIGHTHOUSES.

The French have ingeniously directed the principles of optics to the improvement of lighthouses. In this useful pursuit the celebrated Buffon led the way. Endeavouring to realise the performance ascribed to Archimedes, he disposed 400 mirrors, each of them half a foot square, into a frame, so as to collect the sun's rays into a single focus, and by the reflection from this large surface, in 1747, he actually set fire to wood at the distance of 70 yards. The experiment

was next inverted, and a burner placed in the focus, to have its rays thrown parallel, and produce remote illumination. But for this purpose a much smaller reflector was sufficient, composed of bits of mirror planted in a spherical cavity. The final improvement consisted in hammering thin plated copper into a parabolic shape. These powerful reflectors, combined with Argand's lamp, were about thirty years since introduced from France into our lighthouses.—*Encyc. Brit., new edit.*

STREIGHTENING BUILDINGS.

The walls of a building, under the pressure of a heavy roof, had begun to bulge out, so as to threaten its stability. No force tried was sufficient to restore them to perpendicularity, until the idea occurred of using the contracting force of cooling iron. The opposite walls were connected by a number of iron bars, passing through both, and having nuts, screwed close to the wall, upon their projecting ends, of which bars one half were heated at a time, viz. every second or alternate bar, by lamps placed under them; and while lengthened in consequence, and projecting farther beyond the wall, the nuts were again screwed up; so that on cooling and contracting, they pulled the wall in a degree back to its place. The second set of bars were then similarly treated, and advanced the object as much as the first; and so on, until the object was accomplished.—*Arnott's Physics.*

HOUSE PAINTING.

An exceedingly instructive little volume has fallen under the notice of the Editor, entitled "The Laws of Harmonious Colouring, adapted to House Painting, by D. R. Hay, House Painter in Edinburgh," and a perusal of which would be sure to refine the taste of the artisan engaged in this ingenious profession, and be particularly serviceable to gentlemen in the embellishment of their residences. It will have been often remarked, that the colouring of the walls in our houses is in many cases displeasing to the eye, and quite out of character with the furniture, the carpets, the degree of light, or the nature of the chambers. One room is painted green, because green is a pretty bright colour, while another, for some reason equally frivolous, is daubed over with a pink salmon tint. To correct these, and many other absurdities in house painting, Mr Hay has presented us with a variety of comprehensive rules, the nature of which will be learned by the following extract:—"The tone is the first point to be fixed, and its degree of warmth or coldness will be regulated by the use, situation, and light of the apartment. The next point is the style of colouring, whether gay, sombre, or otherwise; and this is more particularly regulated by the use of the apartment, and the sentiments which it ought to inspire. The tone is generally fixed by the choice of the furniture: for as the furniture of a room may be considered, in regard to colouring, in the same light as the principal figures in a picture, the general tone must depend upon the colours of which it is composed; for instance, if the prevailing colour of the furniture be blue, gray, cool green, or lilac, the general tone must be cool; but if, on the other hand, it is red, orange, brown, yellow, or a warm tint of green or purple, the tone must be warm. But, as hinted before, there can be no pleasing combination of colours without variety: this, by judicious management, may be given, without in the least interfering with the tone, for it is merely the general colour of the furniture which ought to fix the tone, and there may be the most decided contrast in its parts, which, by the introduction of proper tints upon the other parts of the room, can be reconciled and united. Apartments lighted from the south and west, particularly in a summer residence, should be of a cool tone; but the apartments of a town house ought all to approach towards a warm tone; as also such apartments as are lighted from the north and east of a country residence. When the tone of an apartment is therefore fixed by the choice of the furniture, it is the business of the house painter to introduce such tints upon the ceiling, walls, &c., as will unite the whole in perfect harmony; this, as I have already observed, is a difficult task. The colours of the furniture may be arranged by a general knowledge of the laws of harmony, but the painter's part can only be done by the closest attention to all the minutiae of the art. The style of colouring is the next point to be fixed, and will depend entirely on the use of the apartment. In a drawing-room, vivacity, gaiety, and light cheerfulness, should characterise the colouring. This is produced by the introduction of light shades of brilliant colours, with a considerable degree of contrast, gilding, &c., but the brightest colours and strongest contrasts should be upon the furniture; the effect of which will derive additional value and brilliancy from the walls being kept in due subjection. Although they also should partake to a certain extent of the general lightness, yet, if kept rather under in point of brightness and intensity, the general effect will be much improved. The characteristic colouring of a dining-room should be warm, rich, and substantial; and where contrasts are introduced, they should not be vivid. This style of colouring will be found to correspond best with the massive description of the furniture; gilding, unless in very small quantities, for the sake of relief, should be avoided. Parlours ought to be painted in a medium style, between that of a drawing-room and dining-room. The most appropriate style of colouring for libraries is solemn and grave, and no richer colouring should be employed than is

necessary to give the effect of grandeur, which can scarcely be done where one monotonous tint prevails; but care should be taken not to disturb the quiet and solemn tone which ought to characterise the colouring of all apartments of this description. In bed-rooms, a light, cleanly, and cheerful style of colouring, is the most appropriate. A greater degree of contrast may here be admitted between the room and its furniture than in any other apartment, as the bed-curtains, &c. form a sufficient mass to balance a tint of equal intensity upon the walls. There may also for the same reason be admitted gayer and brighter colours upon the carpet. Staircases, lobbies, vestibules, &c., should all be of rather a cool tone, and the style of colour should be simple, and free of contrast. The effect to be produced is that of architectural grandeur, which owes its beauty more to the effect of light and shadow, than to any arrangement of colours. Yet they ought not to be so entirely free from colour as the exterior of a mansion, but should be in colouring, what they are in use, a link between exterior simplicity and interior richness. Staircases and lobbies being cool in tone, and simple in the style of their colouring, will much improve the effect of the apartments which enter from them."

CUTTING INSTRUMENTS.

Every observant manufacturer of cutting instruments of the finer sorts, must have experienced the difficulty of obtaining, in the articles about to be hardened, that uniform degree of heat throughout, which is essential to the production of a perfect edge. "This difficulty," says Mr Nicholson, "formed a very considerable impediment to my success in a course of delicate steel work in which I was engaged about seven years ago; but after various unsuccessful experiments, I succeeded in removing it by the use of a bath of molten lead, which, for very justifiable reasons, has been kept a secret until now. Pure lead, that is to say, lead containing little or no tin, is ignited to a moderate redness, and then well stirred. Into this a piece is plunged for a few seconds; that is to say, until when brought near the surface that part does not appear less luminous than the rest. The piece is then speedily stirred about in the bath, suddenly drawn out, and plunged into a large mass of water. In this manner a plate of steel may be hardened so as to be perfectly brittle, and yet continue so sound as to ring like a bell—an effect which I never could produce in any other way." The tempering process may be performed by immersing the article in the same manner in a bath of molten lead, the temperature of which can be ascertained by means of the thermometer, when it does not exceed the point at which mercury boils. For razor blades or scalpels, Mr Stodart recommends 430° of Fahrenheit, which gives to the steel a faint yellowish tinge or tarnish. It may not be generally known that the hardening of steel does not necessarily depend upon the immersion of the metal in liquid of any kind, but may be equally effected by the application of cold. The hardening of cast-iron articles by chilling the surface has already been mentioned, and the cutlers are well aware that the same phenomenon occurs in the case of a thin blade, placed, when heated, between the hammer and anvil faces when both are cold. The Bulletin Universal lately contained a notice in reference to the practical application of this principle. From the observation of travellers, that the manufacture of Damascus blades was carried on only during the times when north winds occurred, M. Anozoff made experiments on the hardening of steel instruments by putting them, when heated, into a powerful current of air, instead of quenching them in water.—*Manufactures in Metal.*

WEIGHT OF BODIES.

When a body is carried below the surface of the earth, its weight becomes less, because the matter then above it is drawing it up, instead of down, as before. A descent of a few hundred feet makes a sensible difference; and at the centre of the earth, if a man could reach it, he would find things to have no weight at all, and there would be neither up nor down, because bodies would be attracted equally in all directions.—*Arnott's Physics.*

GARDENING—APRIL.

FRUIT GARDEN.

In very bleak situations the blossoms of peaches and nectarines should be protected; but in sheltered situations where the trees have ripened perfectly their last year's wood, they do not require protection, unless the weather should prove very severe. Should insects appear on the young leaves, let them be dusted over with flower of sulphur; but do not attempt to wash them with the engine till the blossoming season is over, and the fruit set. Plant out strawberries, if the plantations have not been completed previously. If alpine strawberries have been raised from seed in the hotbed, the young plants may be picked out on a warm border, under hand-glasses, or in pans or boxes under a frame, till they are fit to plant out finally where they are to remain. Thin out grapes in the stove or forcing-house, and suspend by strings the shoulders of those branches which require it.

KITCHEN GARDEN.

Make hotbeds for cucumbers and melons. Force kidney beans, Elford rhubarb, and sea-kale. The

roots of scarlet running kidney beans, which have been preserved through the winter, may now be planted out, when they will grow afresh, and produce an early and abundant crop. Plant out artichokes, ash-leaved, kidney, and other potatoes, on warm borders, to succeed those grown in frames. In planting out early potatoes, those sets which are cut with one eye only to each will come in sooner by ten days or a fortnight than those cut with two eyes or more. Divide and plant out balm, chamomile, hyssop, lavender, marjoram, mint, penny-royal, rhubarb, sage, sea-kale, sorrel, tansy, tarragon, and thyme. Sow capsicums and love-apples on hotbeds. Sow on warm borders and in the open quarters, asparagus, beets, cabbages, cardoons, celery, chervil, garden and kidney beans, Dutch turnips, lettuces, peas, pot-herbs, radishes, winter-greens, &c. Transplant lettuces from the frames; and towards the end of the month, cauliflowers.

In the flower-garden the main crop of annuals is sown in this month; and great care is taken to protect auriculas, tulips, ranunculuses, hyacinths, and other florists' flowers, from rains and winds. Vermin and birds begin now to be very troublesome to the gardener; but the use of the gun and lime-water will clear the ground of both.

ROBESPIERRE AND DENON.

During the rage for changing every thing which characterised the French republic, it was deemed by the government that the national costume should be altered; and M. Denon, who, it seems, so that he might be permitted to engrave, was always ready to work for angel or devil, was employed about the intended transmutation of the coat of the Frenchman into the Roman toga. "At this period," says his biographer, "an adventure happened to him, which has been related to relate many times. He was summoned by the Committee of Public Safety to report the progress of the work on which he was employed; twelve o'clock at night, was the time appointed. He arrived at the precise hour, but the committee was sitting with closed doors, to discuss, as he was told, matters of importance, and M. Denon was obliged to wait. Two hours passed, during which he heard occasionally loud bursts of laughter, that afforded a strong contrast to the kind of business with which the committee was commonly engaged, and proved that their conversation was not so serious as he had been informed. At last Robespierre came out, and unexpectedly entered the room where M. Denon was sitting. On perceiving a stranger, the savage countenance of the Tribune contracted, and assumed an expression of terror mingled with anger. He asked the unhappy artist, in a tone to turn his stomach, who he was, and what he was doing here at that hour? M. Denon thought he was a lost man; he told his name, however; answered that he came in obedience to the summons he had received, and was waiting until he should be called. Robespierre immediately softened: he conducted M. Denon into the chamber, passed a part of the remainder of the night in chatting with him, and during the whole of their conversation endeavoured to convince him that he was a lover of the fine arts, and had the tastes and manners of a man who had seen good society. M. Denon used to say that the recollection of this event always seemed to him like a dream."

WARSAW.

This interesting city is situated on the left bank of the Vistula, on a high but not rocky ground. There are two pontoon bridges across the river, leading from Warsaw to Praga; but they are always broken up at the setting in of the frost. The Vistula is at this part one of the broadest rivers in Europe. Above the first bridge there is the tolerably large island of the Saxon Boars. It is inhabited by some German families from West Prussia (here called Swabians), and in summer it is the Sunday's resort of the German inhabitants of Warsaw; for the Germans, in whatever part of the world they may be, always make Sunday a day of recreation. Viewed from the Boars or from Praga, Warsaw presents an imposing aspect. Its length, along the banks of the Vistula, is about a German mile and a half, and at the lower or western end it is terminated by an enormous building called the crown barracks. There are no very high steeples in Warsaw. The most conspicuous are the two spires of the Church of the Cross in the New World (the New World is the name of one of the principal streets). The parish church of the old town, with its Gothic steeple, reminds the German of St Thomas's Church at Leipzig. Warsaw is surrounded by mean mud walls, which, owing to their great extent, cannot answer the purpose of fortification. These walls encompass corn fields, gardens, pasture-grounds, and promenades, besides the busy city of Warsaw. The city, which is divided into three parts, the Old Town, the New Town, and the New World, forms a semicircle on the banks of the Vistula. In its general aspect, Warsaw is not inferior to some of the first cities of Europe. About a hundred and fifty palaces, some built in the old Italian and some in the modern style, are interspersed among miserable houses and barracks. The barracks, however, are every year gradually disappearing, and neat private houses, and in some places elegant palaces, are rising on their sites.—*Poland under the Dominion of Russia, by Harro Harring.*

MOISTURE AND QUANTITY OF RAIN.

The average quantity of rain which annually falls in Scotland, appears to be about 31 inches. But its annual amount is an inferior consideration to its general and equable distribution throughout the several days and months of the year. Much rain descending at once is rather hurtful than beneficial to agriculture, whereas those moderate but golden showers, which regularly fall on a soil prepared to receive them, are real sources of fertility. From the following statement it appears that the quantity of rain, on the east coast, is generally one-fifth less than on the west.

Towards the west coast, it rains, or snows, about	Days.
The weather is fair for	205
	160
	365
Towards the east coast, on an average of twelve years, it	
rains for	111
It snows for	24
The weather is fair for	230
	365

Making a difference of not less than 70 days of fair weather in favour of the east coast. In some districts, however, the rainy season is of a still greater duration, amounting to two-thirds of the year, or 244 days, leaving only 121 of fair weather. In Glasgow, the average is 29 inches, 65-100th parts.—In Moray, 24 inches.—At Dundee, 21 23-100th parts.—*Sir J. Sinclair.*

GENEVA.

Geneva, though not the capital of Switzerland, nor even of the Pays de Vaud, is decidedly the Athens of this "land of mountain and of floods." It is a little Edinburgh in head, and Birmingham in hand. The Genevans are zealous in the pursuit of literature and science, as they are ingenious in the construction of watches, gold chains, and musical snuff-boxes. Still industry is the prominent moral character, even of the Helvetic Athens. There can be little doubt that this character has been stamped on the people here, and perhaps in many other places, more by physical than by moral causes. A keen air, a scanty soil, a superabundance of snow, rock, ice, rivers, and lake, are circumstances that must of necessity induce industrious and economical habits. The sharp mountain breeze excites feelings not only of cold, but of hunger—two powerful sti-

mul to labour, which alone can furnish raiment and food. The paucity of soil, and profusion of useless elements, in Switzerland, lead to a careful cultivation of every inch of earth that is capable of yielding materials for food, clothing, arts, or commerce. Economy, too, is a very necessary ingredient. In spite of all that has been written about the pastoral manners, the simplicity and hospitality of the Swiss, it is no more than truth to state, that among those classes with which the traveller comes in contact, there is a degree of Jewishness and selfishness not much surpassed by what is met with in most other parts of Europe. He is not so much cheated, abused, and wrangled with as in Italy; but he is not seldom overreached by a people who have made wonderful advances, of late years, in the arts, as well as the sciences of civilised life.—*Pursuit of Health.*

PORCELAIN.

There is abundant evidence to show that Oriental porcelain was not uncommon in Europe during the first century. The pieces of this manufacture which, according to Pliny, were first seen in Rome, were brought there from Pontus in Asia, by the army of Pompey, 64 years before Christ. Little figures covered with a fine deep-blue glaze, which are found deposited with Egyptian mummies, cause it to appear that porcelain was made in Egypt in very ancient times. It is a curious fact that the colouring matter wherewith these figures are ornamented, and which has been analysed by various chemical tests, affords every indication of its being oxide of cobalt, the identical substance employed for the same purpose by the European porcelain manufacturers of our day, but the use of which was unknown to us until a comparatively recent period. The ore of cobalt was formerly thrown aside by the miners of Saxony as useless, or was employed only in killing rooks. The Portuguese traders were the means of introducing the fine earthenware of China into more general use in Europe; and the name assigned to the fabric, as distinguishing it from the coarser descriptions of pottery of domestic manufacture, was most probably given by them—*porcellana* signifying, in the Portuguese language, a cup. It has been attempted to prove a different origin for the name—attributing it to the resemblance which the glazing or varnish, and probably the colours of porcelain, bear to the scales and scales of the East instead of money (coursies), and which, from the similarity of their shape to that of the back of a little pig, were also called *porcella*.—*Lardner.*

SINGULAR RESEMBLANCE.

John Ambrosius Bach, a German composer, and father of the celebrated musician, John Sebastian Bach, had a brother named John Christopher, also a musician, who so exceedingly resembled him, that their own wives could only distinguish one from the other by the difference of dress! The brothers tenderly loved each other, their voices, dispositions, tastes, dislikes, even the style of their music, were similar. If one sickened, the other also became ill; and they died within a short time of each other.

KAFFIRS.

We had seen, says Rose in his work on Southern Africa, the blue smoke of several kraals (villages) rising among the green hills, when, on turning, we found ourselves in the midst of their beehive tents. The men were sitting round a fire with their dogs and arms about them, and two fresh-buck horns were the sport of the day. The dogs set up a howl, and a Kaffir, rising from the group, advanced towards us—he held out his hand, and repeated the salutation of good will, *Goedendag*; but there was doubt in his movement, and fear in his eye. We gave our hands, and repeated *Goedendag*, and the rest of the horde came around us, asking for presents; but I thought that the children appeared to be frightened with the women and girls were particularly so. One of the devil by which their mothers hush them into obedience. Next day we employed a Kaffir interpreter, and pursued our journey, bivouacking near the kraal of an old chief that lay in our route. It was near sunset when we arrived; the chief Enno and his principal men were sitting on the side of the hill, on which their habitations stood—the young men and boys were herding the cattle, while the women and girls were preparing the evening meal. A friendly—the chief asked what news there was (the regular inquiry both of the savage and the civilised), and could not be persuaded that we had none, while his questions betrayed a minute acquaintance with the movements of military parties, that surprised me—and while he continued to address them to my companion, I went to the dance—to understand the dance, you should have seen it—no description, no drawing can give an idea of a man and woman which was little more than a slow walk of short steps, and yet brought every muscle of the frame into violent exertion. The dancers, linked hand in hand, formed a semicircle, from which two separated themselves, coming to the front with this slow movement, and with strange contortions, and then retiring to their places, while the kept time in all this to a strange monotonous air. The Kaffir women, who were so inferior to the men in appearance, for theirs is the labour of the field, that depresses the body, while hunting, the pursuit of the men, strengthens it. Yet still, even among the women, when young, there are some forms of striking beauty.

THE PASSPORT SYSTEM.

Europe is still, in this respect, one vast and dreary prison! According to all just and good laws, a man is considered innocent till he is proved to be guilty. Yet so under the passport system. There he is always suspected of being guilty, after repeated proofs of innocence! An Englishman undergoes all necessary scrutiny on landing at Calais, and his passport is found to be "quite correct." But a drive along a road where it would be difficult to beg, borrow, or steal—a passage over a crazy wooden plank, or under a tottering gateway, renders him as great an object of political suspicion as if he had crossed the street in a balloon from the cabinet of St James's—always he is under the gaze of gendarmes, and generally at the expense of a franc for his freedom to the next fortified town. This system is vexatious enough in the "Great Nation," but it is still more vexatious in the fifty little nations through which the traveller passes in rapid succession. The more petty, paltry, and subjugated the principality or state through which you pass, the more rigorous the examination of your passport and baggage. Just you may be plotting against its independence (!) or infringing on its commerce! The Prince of Monaco, for example (one of Napoleon's imperial brood, I believe), whose town and territory Gulliver could have extinguished, orders a half-starved serjeant, with a cigar in his mouth, into your room, while breakfasting or dining at Mentone, to demand seventy-five cents for liberty to pass through his empire!—*Pursuit of Health.*

EXERCISE.

At least two hours a-day should be spent in the open air. When the weather is such as not to permit the delicate to go abroad, Mr Abernethy advises the windows to be thrown open, and exercise to be taken by walking up and down the apartments of the house. Walking is the most natural and convenient exercise, and, to the healthy and robust, perhaps the best. Riding on horseback, especially to the dyspeptic, and to those who are threatened with consumptive complaints, has been highly extolled by physicians, and with justice. Dr Parry recommends digging in a garden as a useful and agreeable exercise. The best time for taking exercise, is three or four hours after a meal, when digestion has been completed, when the nutritious chyle has entered the blood-vessels, and when the body feels refreshed and invigorated.—*Economy of the Human Body.*

EDINBURGH: Published, weekly, by W. and R. CHAMBERS, 10, Waterloo Place; ORR & SMITH, 28, George Street; and by J. and A. MACLEOD, 20, Argyle Street; and sold by all other Booksellers in Great Britain and Ireland.

Subscribers in town may have the paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6s.; of a half of twenty-four weeks, 2s.; and of a year, 5s. 6d. In every case payable in advance.

PRICE THREE HALFPENCE.

THE GRECIAN PHILOSOPHIES AND CHRISTIANITY COMPARED

THE most of my young readers are probably aware, that, before the promulgation of the Christian doctrines and morality, there existed different kinds of philosophy, which were the work of certain intelligent Grecian sages. It is probable that some account of those different codes of morals, in contrast with the sublimer and purer theory and applicability of Christianity, may be perused with advantage.

The leading sects of the philosophies of the ancients were the Epicurean, the Stoic, the Peripatetic, and the Academic; the Peripatetic, however, was little more than a modification of the first two; while the characteristic of the Academic was placed principally in its doubts and difficulties, so that the two sects chiefly meriting attention are the Epicurean and the Stoic. The philosophy of Epicurus (a Grecian who flourished about four hundred years before Christ) had for its principal object the enjoyment of pleasure. With its followers pleasure was therefore held as the greatest good, and pain as the greatest evil. On the other hand, the governing aim of the Stoics was a constant virtuous propriety, which led them in principle to despise pleasure, and to hold pain in sovereign contempt. It will at once be perceived that neither of these systems possessed the property of perpetuity. Both were the invention or the freak of persons with a particular turn of mind, and were not of general application. Epicurus himself led a temperate life, and essentially taught that happiness was *not* to be found in mere sensual pleasure; but his theory often led those who adhered to it to become debased voluptuaries; while the philosophy of the Stoics fostered their pride, led them occasionally to commit suicide, produced too frequently unmercifulness and harshness towards their fellow-creatures, and admitted the indulgence of revenge and other ferocious passions; but little else, indeed, could have been expected; nor were sympathy and tenderness of feelings towards others to have been looked for from men whose hearts were steeled even to their own sufferings. The philosophies of the Epicureans and Stoics, it ought also to be mentioned, by no means went the length of releasing the mind from the absurdities of superstition. Although most of the members of those sects had some general though imperfect knowledge of a Supreme Being, yet even *their* minds were generally clouded with the notions of the vulgar, from which their superior attainments could not extricate them. The Epicureans appear to have been uncertain whether the Deity was one, or consisted of a great number; but they felt convinced that they led in heaven lives of indolence and repose, caring nothing about human affairs. Although Socrates said he believed in one Great First Cause, yet he directed at his death a cock should be sacrificed to Esculapius. His general views were good on this important matter, yet we find him gravely recommending that men should honour their country's gods, thus showing that he himself credited both their existence and power. He resembled the ignorant Hindoos, who, though they have a general belief of a great Creator, a preserver and destroyer, yet think there are in the universe innumerable subordinate deities.

With regard to the important question of a future state, the Epicureans totally disbelieved it; and Cæsar, a noted adherent of their sect, in his famous speech in the Roman senate, as to the mode of disposing of or punishing Catiline, had no hesitation in announcing his opinion that death terminated the pains of mortals, and that beyond the grave there was neither sorrow nor joy. The reasonings of Socrates on the subject

have been lauded far beyond their merits, and were confused and unsatisfactory; and while Cicero laughed with not a little scorn at "the triple-headed mastiff, the howling river, the Stygian ferry, and the half-drowned Tantalus," the views which he endeavoured to substitute in their place were very dark, and of but little consequence. The philosophers of the ancient world, who approached probably nearest the truth on these great subjects, were Pythagoras and Plato—the former in the sixth century, and the latter in the fourth century, before Christ; and it is interesting to learn that as both of them, in quest of knowledge, had gone to Egypt, it was understood that they had got their juster ideas by being made acquainted in that country with the Books of Moses and the Prophets. Pythagoras, who visited Babylon during the great captivity, is further supposed to have there met with Ezekiel and Daniel, and been instructed by them. Plato was a follower of Pythagoras in things intellectual, but more enlightened than that philosopher in some things. He believed that there was one God, the author of all things; that the soul is immortal; that men ought to restrain their passions; and that there was a recompense for the good and a punishment for the wicked, after death. He tried to inspire a love of truth and wisdom, and to promote contemplation on objects of an imperishable nature. But in the inculcation of these amiable doctrines, he failed in exciting minds of a gross nature, and he could gain adherents only among the most intelligent, or among persons of a naturally good disposition. One of the most singular features in the philosophy of Plato was his belief relative to *evil*, which he attributed to the existence of *matter*; and then to avoid the danger of appearing to attribute the origin of evil to the Supreme Being, he laid down the proposition that matter was *not* created, but eternal. After his death, his disciples divided themselves into the two sects already noticed—the Academics and the Peripatetics, the latter having Aristotle for their chief.

What chiefly engaged the attention of all those eminent ancients was their *Summum Bonum*, as it was named, or the greatest and most important object of their existence. This differed in the several sects. With regard to that of the Epicureans, under every variety of shade, and under all the refinements which a cultivated intellect could confer, it was in reality *sensual enjoyment*. And as respects that of the Stoics, it seemed to be an abstract idea of propriety, of conforming to the ill-understood will of God, and to live, as they expressed it, "according to nature." Such were their aims; but it is certain that if their *Summum Bonum*, whatever that might be, was meant at all to regard their lives, those lives were the present ones in this world; for their views of its utility extended but little beyond the grave, into regions of which they had but a slender and confused idea. What, then, may we ask, is the amount of all these much-vaunted heathen philosophies? It is, that the religious ideas of their members were generally fanciful and superstitious; that their notions of futurity were dark and unsatisfactory; that the conduct in life which arose from their ruling object was either the pursuit of pleasure and sensual gratification, or it was the commission of suicide, and giving way to the harsher and coarser passions of our nature. Luckily, these fantastic Grecian philosophies carried with them the seeds of their own decay. They were not calculated to endure the "tear and wear" of ordinary life, and were founded on such minute sophisms, or modes of reasoning, that nobody but the studious and learned could comprehend them. And how were they taught? It was by their founders or promoters in academies and

schools, in the porches of temples, and in the recesses of groves: and to whom? Perhaps to a few young men belonging to the upper classes of society, who affected to follow for a season, by turns, the Epicurean or some other philosophy, which they changed with the fashion, and ultimately fell from and forgot. None of the Grecian philosophical teachers from first to last—Pythagoras, Socrates, Democritus, Plato, Aristotle, Epicurus, and so forth—ever made any impression on the public mind, apparently treating the poor and the unlearned as little better than beasts, who were not fit to understand their exalted notions, and who, they imagined, were well off as to their religion, in merely seeing the usual sacrifices performed at the altars. At a somewhat later era the very same inefficiency of these noted philosophies is seen in the conduct of the learned among the Romans; and the transcendent idea of adapting a philosophy to the capacities and the daily wants of *the whole human race*, was never so much as thought of. The leaders of the Grecian schools taught their systems for money, like modern schoolmasters, and the idea of communicating a knowledge in morals, for *nothing*, to the masses of people who crowded the thoroughfares, was a stretch of philanthropy which they did not countenance. Even the Jewish code of laws or religion was but of local application, and thus the field was open for the occupation of some one of extraordinary extent of intellect and beneficent principle, who would for the first time lay down a simple yet vigorous and permanent system of ethics, which all could comprehend, and all find it possible to act upon. Such an individual was at length raised up in the person of the Saviour, Christ. On comparing his important doctrines and morals, as recorded in the history of his life and sufferings in the various books of the New Testament, with those which I above noticed, and which were the best the ancients could show, the veriest sceptic will be compelled to allow that they were the thing which was at the time, and for all time, wanted by mankind. His religion was not promulgated in schools, academies, or secluded groves, to a few pupils gathered from the upper ranks, and with minds trained by cultivation to comprehend it. Nor was it adapted merely to the moral guidance of the rich and the powerful, or confined in its application to any particular country or any exclusive sect. The sentiments taught were of universal utility, and could be sufficiently comprehended by those who had no pretensions to human learning. In a worldly sense, the divine founder of this new and universal school of ethics was of mean origin, was unsupported by any kind of patronage; yet, even under these disadvantages—hated by a haughty priesthood, without school or academy, ignorant of the refined notions of Plato and the rest of the Grecian philosophers, did he *gratuitously* offer for acceptance a system of morality of unexampled excellence, and which the utmost ingenuity and contrivance of the learned for many centuries before him had entirely overlooked, or been unable to establish. The philosophic systems of the Greeks were little else than abstract theories, while *his* religion was of practical application, not only to every action, but to every thought which produced that action. Until he taught, no one from the beginning of the world ever laid down the grand principles in morals, of returning good for evil—of there being sins of the heart as well as of the hand—of the necessity for feeding the poor and clothing the naked—of comforting those in affliction—of judging charitably of others—of the sinfulness of self-love, haughtiness, tyranny, and revenge—and the virtue of humility, and doing to our neighbours what we would desire they should

do unto us. In laying down rules of this nature, nothing very tempting was held out to his followers, as in the case of the Epicurean pleasures; on the contrary, he told plainly that the bounty he offered could not be paid in this world's goods, and that the reward was to be sought for in another state of existence. Yet, though presented under this uninviting aspect, his lessons impressed the minds of immense multitudes of mankind, and soon put to shame the learned pride both of the heathen philosophers and of the Pharisees of his own nation. Unto all, Jesus taught an eternal truth in the unity and omnipotence of God, which in time put an end to all the superstitions of the Pantheon. The sentiments and truths which were in this manner introduced to the notice of mankind, and which are comprehended in the phrase CHRISTIANITY, form essentially the philosophy of the poor man, and is therefore to be hailed as by far the greatest good in morals which has ever been made known to the human race. From small and despised beginnings, in an obscure rugged country in Asia, this beneficent religion has spread abroad, and covered the whole civilised world. "The least of all seeds grew up, and became a great tree, and spread out its branches. The stone which was cut out of the mountain shall itself become a great mountain, and fill the earth."

SECURE ONES.

"I MAK SICKER."

Motto of the Family of Kirkpatrick.

"OH, he's a sicker ane!" is a phrase used in Scotland in reference to that class of people who make excessively sure about every thing, and are in no manner of means to be imposed upon. I style such persons Secure Ones, in order to be intelligible to southern as well as northern readers. Every body must know a certain class of Secure Ones by the timid cautiousness and exactness of their behaviour; by the trim unostentatious propriety of their external aspect. There is a lamb's-woolly comfort and a broadcloth completeness about this sort of Secure One, that nobody can mistake; he even seems to have made the number of buttons in his vest, and the height to which that garment is buttoned up, a matter of accurate calculation. He could not go abroad under less than a certain press of flannel and greatcoat for the world; and you might almost as soon expect to meet him without his left arm as minus the silk umbrella under it. (He carries the latter part of himself, or fifth limb, at an angle of about sixty degrees to the horizon, the handle down behind, and the point forked up in front.) "When he observes any part of the pavement railed off, in order to save the passengers all danger from an occasional pelleting of stones and bits of plaster, which the slaters or chimney-doctors are producing from above, he deploys into the street a good way before coming up to the actual rail or rope, and, in passing, takes care to sweep several good yards beyond the utmost range of shot. "Don't like these things coming peppering down that way; might almost dislocate one's shoulder if they were to fall upon it; perhaps we had better go over to the other side of the street altogether. No need, you know, for running into unnecessary danger." When a Secure One ascends a stair, he goes step after step monotonously on, performing every move of his feet with a sound conscientious deliberation, and seems determined upon doing full justice to every landing-place. He holds firmly, however unnecessarily, by the baluster, since the baluster is there, and he has an obvious satisfaction in the slight pant which he thinks himself entitled to get up on the occasion. The Secure One always shuts a door carefully behind him. He takes off his hat softly, with a regard at once to the smooth economy of his hair, and the pile of his chapeau. He has a maxim that the hat should be first raised and loosened from behind, where it slides up along the glossy hair, not from the front, where it encounters a comparative obstruction from the fleshy brow. He lays down his gloves neatly on the top of each other, and hangs up his hat with an air of carefulness truly exemplary. The Secure One is a bit of an epicure. When out in the forenoon, he would not for any consideration take lunch or wine. "Madam, would you have me spoil my appetite for dinner?" This appetite he nurses and cherishes in the course of his saunterings between two and five, as carefully as a miser doating over his heap. He holds a telegraphic communion with his inner man that passeth show; he coquets and dallies with his stomach; every indescribable symptom is taken into account, and forms the subject of unexpressed congratulation. "Dear tender flowers of appetite, it would be sacrilege, or worse, to nip ye in the bud, by powdering over you the baneful dew of a glass of Baccellae, or the still more odious blight of a basin of mulligatawny. No, I will coax you and protect you, and travel for you, in faithful love and kindness, even until ye shall be fully fattened up for slaughter at five o'clock." When the Secure One sits down to table, he painfully and not unostentatiously (to himself) relieves the one lowest button of his vest from the thrall of button-hole, and with equally deliberate care arranges a napkin over the front of his person. Dinner is a sacred ceremony, and requires its canonicals. Being fully acquainted with the whole planisphere of the table, he takes an exactly proportioned quantity of each article, so as ultimately to have enjoyed each in its exact proportion of merit, and to have precisely

enough out of the whole. A Secure One is frequently an old respectable unmarried gentleman, residing with a single servant—Jenny—in a "self-contained" house about Stockbridge or Newington. Knowing the distance at which he lives from the mercantile parts of the town, he takes care never to want what he calls a pound of change, as well as a small stock of copper—at least the value of a shilling—observing also, that the change is not unmixed with sixpences, so that when any shopkeeper's boy calls for payment of an account, or to take back the purchase-money of any article he has bought that day in town, he may not have to trouble [i. e. trust] the messenger with the duty of obtaining change for a bank-note, which would tend to occasion a more than necessary answering of the bells at the door, besides keeping him in an agony of fiddle-faddle till the little affair was settled. Jenny, who has been so long in his service as to have become almost as secure as himself, never opens the door of nights without putting on the chain; and she has a standing order against all parleying with beggars, or poor women who sell tapes and such things out of baskets. The Secure One regards few creatures in this world with a more jealous or malignant eye than these personages. "Why, sir, they want nothing but to make an opportunity of stripping the lobby or the kitchen!" And such a story he can tell of a missing hat-brush! "A woman seen that morning going about—sold a pair of garters to the maid-servant three doors off at ten—front door had been left open for a minute, not more, while Jenny ran after me with something I had forgot; and in that time—it could have been at no other—the deed was done. A hat-brush I had just got with my last hat at Grieve and Scott's; had a thing that screwed in at the one end, so that it was a stretcher also; cost four-and-sixpence, even taking the hat along with it." And the Secure One, without any premeditated hard-heartedness, thinks nothing of making such an incident apologise to himself for an habitual shutting of his door and his heart against the poor for the next twelve-month. There is never any imperfection in the externals of the Secure One. He bears about him a certain integrity of look that fills and satisfies the eye. From his good well-brushed waterproof beaver, all along down by his roomy blue coat, drab well-fledged, amply-trousered limbs, and so down to his double shoes, not omitting such points as his voluminous white neckcloth without collar, his large Cairngorm brooch, which looks as if a dish of jelly had been inverted into his bosom, and his heavy puffy bunch of seals dangling, clearly defined and well relieved, from the precipice of belly—every thing betokens the Secure One. Clothes are not so much clothes with him as they are a kind of defensive armour! The truth is, the Secure One lives in a state of constant warfare with the skiey influences. The chief campaign is in winter. Instead of entering the field, like Captain Bobadil, about the tenth of March, he opens the trenches towards the twenty-fourth of October. He then invests himself with a cuirass of wool almost thick enough to obstruct the passage of a cannon-ball. For months after, he remains in arms, prepared to stand out against the most violent attacks of the enemy; and in reality there is hardly any advantage to be got of the Secure One by fair open storms or frosts. He bears a charmed life against all such candid-modes of warfare. He cannot be overthrown in a pitched battle. It is only ambuscade draughts through open windows, and other kinds of bush-fighting, that ever are of any effect against him. Like Hector in the armour of Patroclus, he is invulnerable over almost all his whole person; but an arrowy rheumatism, like the spear of Achilles, will sometimes reach him through a very small chink. Like the mighty Achilles himself, he is literally proof, perhaps, against every thing but what assails him through the very lowest part of his person—he can stand every thing but wet feet. There is an instance on record of his having once been laid by the heels for three months, in consequence of sitting one night in the pit of the theatre with a slightly damp umbrella between his knees. He was just about to get entirely better of this disorder, when all at once he was thrown back for six weeks more, by reason, as he himself related, of his having changed the wear (in his sick-chamber) of a silk watch-riband for a chain! "All from the imprudence of that rash girl Jenny, who thought the riband a little shabby, and put on the chain instead. Why, sir, a thick double riband, more than an inch broad; only conceive what a material addition it must have been to my ordinary clothing!" The chain, he might have added, was apt to be worse than nothing, for it was of irregular application, tattooing his person, as it were, with a minutely decussated exposure, so that the cold was likely to have struck him as with the teeth of a comb! The Secure One has an anxiety peculiar to himself on the subject of easy chairs, nightgowns, and slippers. The easy chair must be exact in angle to a single minute of a degree; the nightgown must be properly seen to in respect of fur and flannel; the slippers must every night be placed for him at the proper place; and if Jenny has been so inattentive as to place the left one on the right of the other, he feels himself not a little discomposed. The Secure One is most pestilently and piquantly accurate about all things. He loves to arrange, and arrange, and arrange, and over again arrange, and settle all the preliminaries and pertinents of any little matter which cannot reasonably be done but one way. If he wishes,

for instance, to confer with an upholsterer respecting some alteration in the above easy chair, he first calls one forenoon and inflicts an hour's explanation upon the unhappy man of wood, who is not all a man of wood, otherwise he would in such a case be happy. It does not in the least matter at what hour the tradesman should come to see this chair, for the Secure One is to be at home the whole day. Yet the very liberty at which he stands produces a difficulty. It would be charity in Providence, by any interference, "to give him not to chuse." "Say eleven; I shall then be quite disengaged—will that hour suit you? Or make it any other hour—say twelve—or say half-past eleven—half-past would do very well." [He recollects that he seldom gets the whole fiddle-faddle of feeding the canaries over by half-past.] "Suppose it were a quarter to twelve; that would answer me better still. I may perhaps take a walk out at mid-day; would a quarter to twelve do? Or I might hurry the canaries, and then the half-past might do. I dare say half-past will do best after all; mind half-past eleven," &c. &c. The man comes, and the business of the chair is entered into. The whole affair is most amply canvassed. The Secure One sits down in it, and gives a lecture in a very *ex-cathedra* style upon all its properties and defects. He complains of the back reclining a little too much back, or the bottom showing too little bottom, or some other fault equally inappreciable; and the upholsterer sees at once that the Secure One only complains of this, as he is apt to do of other things, from the very uneasiness arising from its over-easiness.

"Lulled on the rack of a too-easy chair."

The fact is, the Secure One has brought every appliance of life to such an absolute exactitude and perfection, that, having no longer any thing to give him pain, he becomes quite wretched. Secureness, it is evident, may go too far. We may become actually frightened in this world at our own caution. We may be shocked by the very unimpeachability of our own virtue. We may become miserable through the extremity of our happiness. In the same manner the Secure One, when he has "got all things right," as he would say, finds himself, to his great disappointment, just at the threshold of woe and evil. He has exactly got time to set his house in order, before the proper consequence of such an event befalls him; and he expires at the very moment when he has just completed his preparations to live.

There is another order of Secure Ones, whose carefulness refers rather to their wealth than their health. There is an awful inviolability of pocket about such men—a provoking guardedness against all the possible appeals of friendship, and all the impulses of benevolence. Such men look as if they were all staunch-ironed over. *La Pucelle* itself was not more perfectly fortified than their breeches. A poorer man is apt to feel in their presence as if he were under an indictment for an intention either to beg or borrow, or perhaps to steal from them. He sees something criminal against himself in every impregnable-looking button. Secure Ones of this class, perhaps, are bachelors under forty—careful, circumspect men, that have passed through the ordeal of a thousand evening parties without ever being in the least danger. They abstain from marrying, from very fear lest any advantage should be got of them. They cannot enter into the slightest intercourse with a young lady without letting it appear that they are perfectly on their guard. The most undesigning girl, like the above poor man, feels in their presence as if he were liable to be construed into an absolute "drapery miss." He is always quite civil, but that is from his very *secureness*: he knows he is in no danger. An experienced woman gives up a man of this kind at first sight. She sees he is cook's meat—i. e. that she is to marry a middle-aged kitchen woman at fifty, upon the ground of her proficiency in preparing a beef-steak. The general feeling of the sex regarding this sort of Secure One is, "Confound the fellow! does he think that any one cares for him, or would take him though he were willing?"

"Nobody wants you, Sir, she said."

The Secure One, however, does not appear ever to suppose that the ladies have a veto in proposals of marriage. He looks upon them all as a class so eager on capturing and entrapping men, that it never enters into his head that there is such a thing as a rejected offer. The man he considers to be the passive and accepting party; the lady is the besieging enemy, and he is the fortress; the marriage takes place only if he chooses. It may be supposed, then, what would be the state of a Secure One's mind, if he were to relent some fine day in a fit of generosity (a thing only to be supposed in the event of his becoming *fey*), and in a liberal, candid, honourable manner, offer his hand to a young lady of little fortune, whom he was disposed to think suitable on the score of personal merit alone, but who, having some prior attachment to a man one half as old, and twice as generous, was under the necessity of only thanking him for the honour. The cook or any thing after that! And how the whole sex would rejoice in his calamity!! "A fellow, forsooth, that has been a living insult to the tribe of womankind all his days. He is well served."

There is another kind of Secure One, considerably different in circumstances from the above—a married man about sixty, with a large family, in which there are several grown daughters. These girls are constantly under his eye. At church he puts them into a pew,

and sits down at the door himself, as if he were a kind of serpent guarding the Hesperian fruit. To the eyes of hundreds of young men under twenty, who are not yet considered to be sufficiently settled in the world to marry, these young ladies seem unapproachable as the top of the steeple. They look as if they were absolutely walled round with jealous and *secure* paternity. One after another they are taken off by middle-aged cousins and other distant relations, about whose "respectability" there can be no doubt; and the young men in the back pews sigh to see that the family is determined upon being self-contained. For it is one of those families, perhaps, who enjoy the credit of a great deal of vague, and not very strictly apportioned wealth, under the clause, "There's plenty o' siller amang them;" and who seem as if they would consider the admission of a stranger into the circle as a thing of some danger, however "respectable" he might appear.

STORY OF MRS MACFARLANE.

It was formerly the fashion in Scotland for every father of a family to take all the people under his care along with him to church, leaving the house locked up till his return. No servant was left to cook the dinner, for it was then judged improper to take a dinner which required cooking. Neither, except in the case of a mere suckling, was it considered necessary to leave any of the children; every brat about the house was taken to church also; if they did not understand what was said by the minister, they at least did not prevent the attendance of those who did; and moreover—and this was always a great consideration—they were out of harm's way. One Sunday in autumn 1719, Sir John Swinton of Swinton, in Berwickshire, was obliged to omit his little daughter Margaret from the flock which usually followed him to church. The child was indisposed with some trifling ailment, which, however, only rendered it necessary that she should keep her room. It was not considered requisite that a servant should be left behind to take charge of her, for she was too sagacious a child to require any such guardianship; and Sir John and Lady Swinton naturally grudged, with the scruples of the age, that the devotions of any adult member of their household should be prevented on such an account. The child, then, was left by herself in one of the upper bedrooms of the old baronial mansion of Swinton, no other measure being taken for her protection than that of locking the outer door.

For a girl of ten years of age, Margaret Swinton was possessed of much good sense and solidity of character. She heard herself doomed to a solitary confinement of six hours without shrinking; or thought, at least, that she would have no difficulty in beguiling the time by means of her new book—the *Pilgrim's Progress*. So long as the steps and voices of her kindred were heard about the house, she felt quite at her ease. But, in reality, the trial was too severe for the nerves of a child of her tender age. When she heard the outer door locked by the last person that left the house, she felt the sound as a knell. The shot of the bolt echoed through the long passages of the empty house with a supernatural loudness; and, next moment after, succeeded that perceptible audible quiet, the breath-like voice of an untenanted mansion, which, like the hum of the vacant shell, seems still as if it were charged with sounds of life. There was no serious occasion for fear, seeing that nothing like real danger could be apprehended; nor was this the proper time for the appearance of supernatural beings; yet the very loneliness of her situation, and the speaking stillness of all around her, insensibly overspread her mind with that vague negative sensation which is described by the native word *eerness*. From her window nothing was visible but the cold blue sky, which was not enlivened by even the occasional transit of a cloud. By and bye the desolating wind of autumn began to break upon the moody silence of the hour. It rose in low melancholy gusts, and, whistling monotonously through every chink, spoke to the mind of this little child, of withering woods, and the lengthened excursions of hosts of leaves, hurried on from the scene of their summer pride into the dens and hollows where they were to decay. The sound gradually became more fitful and impetuous, and at last appeared to her imagination as if it were the voice of an enemy who was running round and round the house, in quest of admission—now and then going away as if disappointed and foiled; and anon returning to the attack, and breathing his rage and vexation in at every aperture. She soon found her mind possessed by a numerous train of fantastic fancies and fearful associations, drawn from the store of nursery legends and ballads, which she was in the habit of hearing, night after night, at the fireside in the hall, and which were infinitely more dreadful than the refined superstitions of modern children. She thought of the black bull of Norway, which went about the world destroying whatever of human life came within its reach; of the weary well at the World's End, which formed the entrance into new regions, from whence no traveller ever returned; and of the fairies or *good neighbours*, a small green-coated race of supernatural creatures, who often came to the dwellings of mortals, and did them many good and evil turns. She had been told of persons yet alive, who in their childhood had been led away by these fays into the wood, and fed for weeks with wildberries and the milk of nuts, till at length, by the *po'orfu*

preaching of some great country divine, they were reclaimed to their parents, being in such cases generally found sitting under a tree near their own homes. She had heard of a queen of these people—the Queen of Elfinland—who occasionally took a fancy for fair young maidens, and endeavoured to wile them into her service; and the thought occurred to her, that, as the fairies could enter through the smallest aperture, the house might be full of them at this moment.

For several hours the poor child suffered under these varied apprehensions, till at last she became in some measure desperate, and resolved at least to remove to another part of the house. The parlour below stairs commanded from its window a view of the avenue by which the house was approached; and she conceived that, by planting herself in the embrasure of one of those windows, she would be at the very border of the *erie* region within doors, and as near as possible to the scene without, the familiarity of which was in itself calculated to dispel her fears. From that point, also, she would catch the first glimpse of the family returning from church, after which she would no longer be in solitude. Trying, therefore, to think of a merry border tune, she opened her own door, walked along the passage—making as much noise as she could—and tramped sturdily and distinctly down stairs. The room of which she intended to take possession was at the end of a long passage leading from the back to the front of the house. This she traversed slowly—not without fear of being caught from behind by some unimaginable creature of horror; an idea which, on her reaching the chamber door, so far operated upon her, that, yielding to her imaginary terrors, and yet relying for safety upon getting into the parlour, she in the same moment uttered a slight scream, and burst half joyfully into the room. Both of these actions scarcely took up more than the space of a single moment, and in another instant she had the door closed and bolted behind her. But what was her astonishment, her terror, and her awe, when, on glancing round the room, she saw distinctly before her, and relieved against the light of the window, the figure of a lady, in splendid apparel, supernaturally tall, and upon whose countenance was depicted a surprise not less than her own! The girl stood fixed to the spot, her breath suspended, and her eyes wide open, surveying the glorious apparition, whose beauty and fine attire, unlike aught earthly she had ever seen, made her believe it to be an *enchanted queen*—an imaginary being, of which the idea was suggested to her by one of the nursery tales already alluded to. Fortunately, the associations connected with this personage were rather of a pathetic than an alarming character; and though she still trembled at the idea of being in the presence of a supernatural object, yet, as it was essentially beautiful and pleasing, and supposed to be rather in a condition of suffering than in the capacity of an injurer, Margaret Swinton did not experience the extremity of terror, but stood for a few seconds in innocent surprise, till at length the vision completely assured her of its gentle and pacific character, by smiling upon her, and, in a tone of the most winning sweetness, bidding her approach. She then went forward, with timid and slow steps, and, becoming convinced that her enchanted queen was neither more nor less than a real lady of this world, soon ceased to regard her with any other sentiment than that of admiration. The lady took her hand, and addressed her by name—at first asking a few unimportant questions, and concluding by telling her that she might speak to her mother of what she had seen, but by no means to say a word upon the subject to any other person, and that under pain of her mother's certain and severe displeasure. Margaret promised to obey this injunction, and was then desired by the lady to go to the window, to see if the family were yet returning from church. She did so, and found that they were not as yet in sight; when, turning round to give that information to the stranger, she found the room empty, and the lady gone. Her fears then returned in full force, and she would certainly have fainted, if she had not been all at once relieved by the appearance of the family at the head of the avenue, along which the dogs—as regular church-goers as their master—ran barking towards the house, gratifying her with what she afterwards declared to have been the most welcome sounds that ever saluted her ear.

Miss Swinton, being found out of her own room, was sharply reprimanded by her mother, and taken up stairs to be again confined to the sick-chamber. But before being left there, she found an opportunity of whispering into her mother's ear that she had seen a lady in the low parlour. Lady Swinton was arrested by the words, and, immediately dismissing the servant, asked Margaret, in a kindly and confidential tone, what she meant. The child repeated, that in the low parlour she had seen a beautiful lady—an *enchanted queen*—who had afterwards vanished, but not before having exacted from her a promise that she would say nothing of what she had seen except to her mother. "Margaret," said Lady Swinton, "I see you have been a very good girl; and since you are so prudent, I will let you know a little more about this enchanted queen, though her whole story cannot properly be disclosed to you at present." She then conducted Margaret back to the parlour, pushed aside a sliding panel, and entered a secret chamber, in which the child again saw the tall and beautiful woman, who was now sitting at a table with a large prayer-book open before her. Lady Swinton informed the stranger, that

as Margaret had kept her secret so far according to her desire, she now brought her to learn more of it. "My dear," said her ladyship, "this lady is unfortunate—her life is sought by certain men; and if you were to tell any of your companions that you have seen her, it might perhaps be the cause of bringing her to a violent death. You could not wish that the enchanted queen should suffer from so silly an error on your part." Margaret protested, with tears, that she would speak to none of what she had seen; and after some farther conversation, she and her mother retired.

Margaret Swinton never again saw this apparition; but some years afterwards, when she had grown up, and all fears respecting the unfortunate lady were at an end, she learned the particulars of her story. She was a person whose fatal history made a noise at the time over all Britain, and interested alike the intelligent and the ignorant, the noble and the mean.—To be concluded in next publication.

THE LAIRD OF WARISTOUN.

THE estate of Waristoun, near Edinburgh, now partly covered by the extended streets of the metropolis on its northern side, is remarkable in local history for having belonged to a gentleman, who, in the year 1600, was cruelly murdered at the instigation of his wife. This unfortunate lady, whose name was Jean Livingston, was descended from a respectable line of ancestry, being the daughter of Livingstone, the laird of Dunipace, in Stirlingshire, and at an early age was married to John Kincaid, the laird of Waristoun, who, it is believed, was considerably more advanced in years than herself. It is probable that this disparity of age laid the foundation of much domestic strife, and led to the tragical event now to be noticed. The ill-fated marriage and its results form the subject of an old Scottish ballad, in which the proximate cause of the murder is said to have been a quarrel at the dinner-table:—

It was at dinner as they sat,
And when they drank the wine,
How happy were the laird and lady
Of bonnie Waristoun!
But he has spoken a word in jest;
Her answer was not good;
And he has thrown a plate at her,
Made her mouth gush with blood.

Whether owing to such a circumstance as is here alluded to, or a bite which the laird is said to have inflicted upon her arm, is immaterial; the lady, who appears to have been unable to restrain her malignant passions, conceived the diabolical design of having her husband assassinated. There was something extraordinary in the deliberation with which this wretched woman approached the awful gulf of crime. Having resolved on the means to be employed in the murder, she sent for a quondam servant of her father, Robert Weir, who lived in the neighbouring city. He came to the place of Waristoun, to see her; but it appears her resolution failed, and he was not admitted. She again sent for him, and he again went. Again he was not admitted. At length, on his being called a third time, he was introduced to her presence. Before this time, she had found an accomplice in the nurse of her child. It was then arranged that Weir should be concealed in a cellar till the dead of night, when he should come forth and proceed to destroy the laird as he lay in his chamber. The bloody tragedy was acted precisely in accordance with this plan. Weir was brought up, at midnight, from the cellar to the hall by the lady herself, and afterwards went forward alone to the laird's bedroom. As he proceeded to his bloody work, she retired to her bed, to wait the intelligence of her husband's murder. When Weir entered the chamber, Waristoun awoke with the noise, and leant inquiringly over the side of the bed. The murderer then leapt upon him; the unhappy man uttered a great cry; Weir gave him some severe blows on vital parts, particularly one on the flank vein. But as the laird was still able to cry out, he at length saw fit to take more effective measures; he seized him by the throat with both hands, and, compressing that part with all his force, succeeded, after a few minutes, in depriving him of life. When the lady heard her husband's first deathshout, she leapt out of bed, in an agony of mingled horror and repentance, and descended to the hall; but she made no effort to countermand her mission of destruction. She waited patiently till Weir came down to inform her that all was over. Weir made an immediate escape from justice; but Lady Waristoun and the nurse were apprehended before the deed was half a day old. Being caught, as the Scottish law terms it, *red-hand*—that is, while still bearing unequivocal marks of guilt, they were immediately tried by the magistrates of Edinburgh, and sentenced to be strangled and burnt at a stake. The lady's father, the laird of Dunipace, who was a favourite of King James VI., made all the interest he could with his majesty to procure a pardon; but all that could be obtained from the king was an order that the unhappy lady should be executed by decapitation, and that at such an early hour in the morning as to make the affair as little of a spectacle as possible. The space intervening between her sentence and her execution was only thirty-seven hours; yet in that little time Lady Waristoun contrived to become converted from a blood-stained and unrelenting murderess into a perfect saint on earth. One of the then ministers of Edinburgh has left an account of her

conversion, which was lately published, and would be extremely amusing, were it not for the loathing which seizes the mind on beholding such an instance of perverted religion. She went to the scaffold with a demeanour which would have graced a martyr. Her lips were incessant in the utterance of pious exclamations. She professed herself confident of everlasting happiness. She even grudged every moment which she spent in this world, as so much taken from that sum of eternal felicity which she was to enjoy in the next. The people who came to witness the last scene, instead of having their minds inspired with a salutary horror for her crime, were engrossed in admiration of her saintly behaviour, and greedily gathered up every devout word which fell from her tongue. It would almost appear, from the narrative of the clergyman, that her fate was rather a matter of envy than of any other feeling. Her execution took place at four in the morning of the 5th of July, at the Watergate, near Holyrood-house; and at the same hour her nurse was burnt on the Castle-hill. It is some gratification to know that the actual murderer, Weir, was eventually seized and executed, though not till four years after.

THE UNLUCKY PRESENT.—A TALE.

A LANARKSHIRE minister (who died within the present century) was one of those unhappy persons, who, to use the words of a well-known Scottish adage, "can never see green cheese but their een reels." He was *extremely covetous*, and that not only of nice articles of food, but of many other things which do not generally excite the cupidity of the human heart. The following story is in corroboration of this assertion:—Being on a visit one day at the house of one of his parishioners, a poor lonely widow, living in a moorland part of the parish, he became fascinated by the charms of a little cast-iron pot, which happened at the time to be lying on the hearth, full of potatoes for the poor woman's dinner, and that of her children. "He had never in his life seen such a nice little pot—it was a perfect conceit of a thing—it was a gem—no pot on earth could match it in symmetry—it was an object altogether perfectly lovely. "Dear sake! minister," said the widow, quite overpowered by the reverend man's commendations of her pot, "if ye like the pot sae weel as a' that, I beg ye'll let me send it to the manse. It's a kind o'orra (*superfluous*) pot wi' us; for we've a bigger ane, that we use for ordinar, and that's mair convenient every way for us. Sae ye'll just tak a present o't. I'll send it ower the morn wi' Jamie, when he gangs to the schule." "Oh!" said the minister, "I can by no means permit you to be at so much trouble. Since you are so good as to give me the pot, I'll just carry it home with me in my hand. I'm so much taken with it, indeed, that I would really prefer carrying it myself." After much altercation between the minister and the widow on this delicate point of politeness, it was agreed that he should carry home the pot himself.

Off then he trudged, bearing this curious little culinary article, alternately in his hand and under his arm, as seemed most convenient to him. Unfortunately the day was warm, the way long, and the minister fat, so that he became heartily tired of his burthen before he got half-way home. Under these distressing circumstances, it struck him, that if, instead of carrying the pot awkwardly at one side of his person, he were to carry it on his head, the burden would be greatly lightened; the principles of natural philosophy, which he had learned at college, informing him, that when a load presses directly and immediately upon any object, it is far less onerous than when it hangs at the remote end of a lever. Accordingly, doffing his hat, which he resolved to carry home in his hand, and having applied his handkerchief to his brow, he clapped the pot, in inverted fashion, upon his head, where, as the reader may suppose, it figured much like Mambrino's helmet upon the crazed capital of Don Quixote, only a great deal more magnificent in shape and dimensions. There was at first much relief and much comfort in this new mode of carrying the pot; but mark the result. The unfortunate minister having taken a by-path, to escape observation, found himself, when still a good way from home, under the necessity of leaping over a ditch which intercepted him in passing from one field to another. He jumped; but surely no jump was ever taken so completely *in*, or at least *into*, the dark as this. The concussion given to his person in descending caused the helmet to become a hood; the pot slipped down over his face, and resting with the rim upon his neck, struck fast there, enclosing his whole head as completely as ever that of a new-born child was enclosed by the filmy bag with which nature, as an indication of future good fortune, sometimes invests the noddles of her favourite offspring. What was worst of all, the nose, which had permitted the pot to slip down over it, withstood every desperate attempt, on the part of its proprietor, to make it slip back again; the contracted part, or neck, of the *patera*, being of such a peculiar formation as to cling fast to the base of the nose, although it had found no difficulty in gliding along its hypotenuse. Was ever minister in a worse plight? Was there ever *contretemps* so unlucky? Did ever any man—did ever any minister, so effectually hoodwink himself, or so thoroughly shut his eyes to the plain light of nature? What was to be done? The place was lonely; the

way difficult and dangerous; human relief was remote, almost beyond reach. It was impossible even to cry for help; or if a cry could be uttered, it might reach, in deafening reverberation, the ear of the utterer, but it would not travel twelve inches farther in any direction. To add to the distresses of the case, the unhappy sufferer soon found great difficulty in breathing. What with the heat occasioned by the beating of the sun on the metal, and what with the frequent return of the same heated air to his lungs, he was in the utmost danger of suffocation. Every thing considered, it seemed likely that, if he did not chance to be relieved by some accidental wayfarer, there would soon be *death in the pot*.

The instinctive love of life, however, is omnipotent; and even very stupid people have been found, when put to the push by strong and imminent peril, to exhibit a degree of presence of mind, and exert a degree of energy, far above what might have been expected from them, or what they were ever known to exhibit, or exert, under ordinary circumstances. So it was with the pot-ensconced minister. Pressed by the urgency of his distresses, he fortunately recollected that there was a smith's shop at the distance of about a mile across the fields, where, if he could reach it before the period of suffocation, he might possibly find relief. Deprived of his eyesight, he acted only as a man of feeling, and went on as cautiously as he could, with his hat in his hand. Half crawling, half sliding over ridge and furrow, ditch and hedge, somewhat like Satan floundering over chaos, the unhappy minister travelled with all possible speed, as nearly as he could guess, in the direction of the place of refuge. I leave it to the reader to conceive the surprise, the mirth, the infinite amusement of the smith, and all the hangers-on of the *smithy*, when, at length, torn and worn, faint and exhausted, blind and breathless, the unfortunate man arrived at the place, and let them know (rather by signs than by words) the circumstances of his case. In the words of an old Scottish song,

"Out cam the gudeman, and high he shouted,
Out cam the gudewife and low she louted,
And a' the town neighbours were gathered about it,
And there was he, I trow."

The merriment of the company, however, soon gave way to considerations of humanity. Ludicrous as was the minister, with such an object where his head should have been, and with the feet of the pot pointing upwards, like the horns of the Great Enemy, it was, nevertheless, necessary that he should be speedily restored to his ordinary condition, if it were for no other reason than that he might continue to live. He was, accordingly, at his own request, led into the smithy, multitudes flocking around to tender him their kindest offices, or to witness the process of release; and having laid down his head upon the anvil, the smith lost no time in seizing and poising his goodly forehead. "Will I come sair on, minister?" exclaimed the considerate man of iron, in at the brink of the pot. "As sair as ye like," was the minister's answer; "better a chap i' the chafits than die for want of breath." Thus permitted, the man let fall a blow, which fortunately broke the pot in pieces, without hurting the head which it enclosed, as the cookmaid breaks the shell of the lobster, without bruising the delicate food within. A few minutes of the clear air, and a glass from the gudewife's bottle, restored the unfortunate man of prayer; but, assuredly, the incident is one which will long live in the memory of the parishioners of C—.

BIOGRAPHIC SKETCHES.

JOHN HUNTER.

THE celebrated John Hunter, one of the greatest anatomists that ever lived, scarcely received any education whatever until he was twenty years old. He was born in the year 1728, in Lanarkshire; and being the youngest of a family of ten, and the child of his father's old age, would seem to have been brought up with the most foolish and unfortunate indulgence. When he was only ten years old, his father died; and under the charge of his mother it is probable that he was left to act as he chose, with still less restraint than ever. Such was his aversion at this time to any thing like regular application, that it was with no small difficulty, we are told, he had been taught even the elements of reading and writing; while an attempt that was made to give him some knowledge of Latin (according to the plan of education then almost universally followed in regard to the sons of even the smallest landed proprietors in Scotland), was, after a short space, abandoned altogether. Thus he grew up, spending his time merely in country amusements, and for many years without even thinking, as it would appear, of any profession by which he might earn a livelihood. It was, however, found necessary at last that something should be determined upon in regard to this point; for the family estate, such as it was, had gone to his eldest brother, and the father had made no provision for maintaining John any longer in idleness. So destitute as he was of all literary acquirements, there was no other resource for him except some business that would give employment to his hands rather than his head; and one of his sisters having married a cabinet-maker, or carpenter, in Glasgow, it was resolved he should be bound apprentice to his brother-in-law. With this person, accordingly, he continued for some time, learning to make chairs and tables; and this probably might have been, for life, the employment of the genius that afterwards distinguished itself so greatly in one of the most important walks of philosophic discovery, but for circumstances which, at the time when they occurred, were doubtless deemed unfortunate. His

master failed, and John was left without any obvious means of pursuing even the humble line of life on which he had set out. He was at this time in the twentieth year of his age. His elder brother William, afterwards the celebrated Dr Hunter, had very recently settled as a medical practitioner in London, but had already begun to distinguish himself as a lecturer and anatomical demonstrator. To him John determined to address himself. The rumour of the one brother's success and growing reputation had probably, even before this time, awakened something of ambition in the other, with a wish to escape from the obscure fortune to which he seemed destined. John now wrote to his brother, offering him his services as an assistant in his dissecting-room, and intimating, that if this proposal should not be accepted, he meant to enlist in the army. Fortunately for science, his letter was answered in the way he wished. On his brother's invitation he set out for the metropolis. He was now put to work in the manner in which he had requested to be employed. His brother, we are informed by Sir Everard Home, his first and best biographer, gave him an arm to dissect, so as to display the muscles, with directions how it should be done; and the performance of the pupil even in this his commencing essay, greatly exceeded the expectations of his instructor. The doctor then put into his hands another arm, in which all the arteries were injected, and these, as well as the muscles, were to be exposed and preserved. So satisfied was Dr Hunter with his brother's performance of this task, that he assured him he would in time become an excellent anatomist, and would not want employment. Perhaps, although we do not find it so stated by any of his biographers, he may have felt an advantage, in making these preparations, in the habits of manual dexterity acquired during his apprenticeship to his first business.

So rapid, at all events, was the progress which he made in the study of anatomy, that he had not been a year in London when he was considered by his brother as qualified to teach others, and was attended accordingly by a class of his own. His talents, and the patronage of his brother together, brought him now every day more and more into notice. It does not belong to our purpose to trace the progress of his success after this point. We may merely remark, that long before his death he had placed himself, by universal acknowledgment, at the head of living anatomists, and was regarded, indeed, as having done more for surgery and physiology than any other investigator of these branches of science that had ever existed.

The important discoveries, and peculiar and most original views, by which John Hunter succeeded in throwing so much new light upon the subject of the functions of animal life, were derived, as is well known, principally from the extraordinary zeal, patience, and ingenuity, with which he pursued the study of comparative anatomy, or the examination of the structure of the inferior animals as compared with that of man. To this study he devoted his time, his labour, and, it may be said, his fortune; for nearly every shilling that he could save from his professional gains was expended in collecting those foreign animals, and other rare specimens, by means of which he prosecuted his inquiries. When his income was yet far from being a large one, he purchased a piece of ground at Earl's Court, in the village of Brompton, and built a house on it to serve as a place of deposit for his collections. The space around it was laid out as a zoological garden for such of his strange animals as he kept alive. Even when most extensively engaged in practice, he used to spend every morning, from sun-rise till eight o'clock, in his museum. Yet, in addition to his private practice, and a very long course of lectures, which he delivered every winter, he had for many years to perform the laborious duties of surgeon to St George's Hospital, and deputy-surgeon-general to the army—superintending, at this time also, a school of practical anatomy at his own house. Still he found leisure, in the midst of all these avocations, not only for his experiments upon the animal economy, but for the composition of various works of importance, and for taking an active part both in the deliberations of the Royal Society, of which he had been early elected a Fellow, and in other schemes for the promotion and diffusion of natural knowledge. He was the originator, in particular, of the *Lyceum Medicum Londinense*—a medical society comprising many eminent individuals, which met at his lecture-rooms, and rose to great reputation. That he might have time for these multiplied objects of attention, he used to allow himself only to sleep four hours at night, and an hour after dinner.

In order to procure subjects for his researches in comparative anatomy, his practice was to apply to the keeper of the wild beasts in the Tower, and the proprietors of the other menageries in town, for the bodies of such of their animals as died, in consideration of which he used to give them other rare animals to exhibit, on condition of also receiving their remains at their death. His friends and former pupils, too, were wont to send him, from every part of the world, subjects for his favourite investigations. "In this retreat (at Brompton) he had collected," says Sir Everard Home, "many kinds of animals and birds; and it was to him a favourite amusement in his walks to attend to their actions and their habits, and to make them familiar with him. The fiercer animals were those to which he was most partial, and he had several of the bull kind from different parts of the world. Among these was a beautiful small bull he had received from the queen, with which he used to wrestle in play, and entertain himself with his exertions in its own defence. In one of these conflicts the bull overpowered him and got him down; and had not one of the servants accidentally come by, and frightened the animal away, this frolic would probably have cost him his life." On another occasion, "two leopards," says the same biographer, "that were kept chained in an outhouse, had broken from their confinement, and got into the yard among some dogs, which they immediately attacked. The howling this produced alarmed the whole neighbourhood. Mr Hunter ran into the yard to see what was the matter, and found one of them get-

ting up the wall to make his escape, the other surrounded by the dogs. He immediately laid hold of them both, and carried them back to their den; but as soon as they were secured, and he had time to reflect upon the risk of his own situation, he was so much affected that he was in danger of fainting."

Mr Hunter died in the sixty-sixth year of his age, in 1793. After his death, his museum was purchased by Parliament for the sum of fifteen thousand pounds, and it is now deposited in the hall belonging to the Royal College of Surgeons, in Lincoln's Inn Fields. It is understood to contain about twenty thousand anatomical preparations, which are arranged so as (in the language of Sir Everard Home) "to expose to view the gradations of nature, from the most simple state in which life is found to exist, up to the most perfect and most complex of the animal creation—man himself." The extreme beauty of these preparations is striking even to an unlearned eye; and their scientific value is such as to render the collection one of the most precious of its kind in the world. It is certainly one of the most splendid monuments of labour, skill, and munificence, ever raised by an individual.

It is important to remark, that, with all his powers, this wonderful man never entirely overcame the disadvantages entailed upon him by the neglect in which he had been allowed to spend his early years. He used to dwell, we are told, on the advantage which is gained in regard to clearness of conception by the committing of one's ideas to writing—comparing the process to the taking of stock by a tradesman, without which he cannot know with certainty either what he has or what he wants. Yet he himself continued to the end of his life an awkward, though by no means an unpractised writer. After coming to London, he entered himself of St Mary's Hall, Oxford, probably with the view of being able to maintain at least some pretensions to scholarship, but it does not appear that he carried his assumption of the academical character much farther. He attained little acquaintance with the literature even of his own profession; and it not unfrequently happened indeed, we are told, that upon communicating a supposed discovery of his own to some one of his more erudite friends, he had to suffer the disappointment of learning that the same thing had been already found out by some well-known anatomist. But he felt his literary deficiencies chiefly as a lecturer, the capacity in which his more regularly educated brother so greatly excelled. It is asserted by Dr Adams, who has written a life of John Hunter, that he always used to swallow thirty drops of laudanum before going to lecture. If these were heavy penalties, however, which he had to pay for what was not so much his fault as that of others, the eminence to which he attained in spite of them is only the more demonstrative of his extraordinary natural powers, and his determined perseverance.—*Library of Entertaining Knowledge.*

ROADS IN SCOTLAND.

MR BUCHANAN, civil engineer, has just published a very clear and ably written account of the railways of the west of Scotland, in connection with four views, by Mr D. O. Hill, of the opening of the Garnkirk railway. From this work we derive the following notice of former modes of communication in Scotland:—

"In Scotland, the progress of improvement, though rather late in beginning, has advanced with extraordinary rapidity, and is now keeping pace with her richer neighbour. It is scarcely a century since there was nothing deserving the name of a road in any of our great thoroughfares; the whole inland trade of the kingdom was carried on by means of packhorses; and persons are still alive who remember perfectly the carriers between Edinburgh and Glasgow going regularly with five or six horses in a train; and so narrow was the track, that the leading one had a bell at his head, to give warning of their approach to the party travelling in the opposite direction, that the one might have time to get out of the way while the other was passing. In this manner they jogged along, over all the inequalities of the country through which the road passed, and fording the different rivers and streams, on which bridges were yet unknown. Carts were then only used in the metropolis or principal towns, and coaches or carriages rarely in the country, travelling being almost universally performed on horseback. In many parts, particularly in low and wet grounds, the roads or tracks were often impassable. The late Lord Hermand used to relate, that when he was first sent to Edinburgh College from Ayrshire, about 1760, the road was in such a state, that in some places servants were dispatched beforehand with poles to sound the depth of the mosses and bogs which lay in their way. [Mr Buchanan might have added, that, when John Earl of Loudoun was sent to Edinburgh, a boy, about 1730, he travelled with his baggage in a pair of panniers across a pony's back; himself in the one pannier, and his baggage in the other.] Wretched as internal communications seem to have been, they fully kept pace with the progress of trade and intercourse throughout the country. The mail was dispatched regularly between Edinburgh and London on horseback, and went in the course of five or six days; but so little communication was there between the two capitals, that, as I have heard related on unquestionable authority, during the time of the rebellion of 1745, when an order came down from London to open all the letters in the Post Office, with the view of detecting treasonable correspondence, there were not, altogether, above twenty in the London bag—such was the low state of trade and business, the true cause of the backward state of the roads, and of all the other accommodations which distinguish a rich and improving country. [It is perhaps worth mentioning also, that at the commencement of the civil war, an interchange of diplomatic correspondence between Edinburgh and London never occupied less than a month, although it must be admitted that the news of the death of Queen Elizabeth, which was brought from London to Edinburgh between a Thursday morning and Saturday night, by Sir Robert Carey, on horseback, was a wonderful instance of what could sometimes be done even in those times. In the

decade of 1750-60, a coach travelled from Edinburgh to London, occupying a fortnight except one day—that is, from Monday morning to the Saturday at the end of the succeeding week—the intervening Sunday being spent tranquilly at Boroughbridge in Yorkshire, where, we suppose, the travellers went decently to church along with their landlord. In those days the Post Office was kept in a flat in the Parliament Square, and, according to the recollection of the late Henry Johnston Wylie, Esq., who died two years ago, there was but one letter-carrier.] About the year 1770, roads were so much amended, that carts had come into general use, particularly on farms, and in driving grain to market. With these one horse might draw five or six hundredweight, while the packhorse could only carry three. In the year 1790, the construction and management of the roads began to excite great public attention, and improved lines were formed in all parts of the country, and constructed of better materials; so that, on the whole, the load of a single cart-horse was increased to eight or ten hundredweight, and travelling in carriages became very common. Since that period improvements have advanced with accelerated rapidity; and such have been the effects of those on the powers of draught, that there is now no public road in the kingdom in which a single cart-horse does not with ease draw sixteen hundredweight, and on many of them a good horse will draw twenty-five hundredweight. Such has also been the effect of the velocity of motion, that the London mail now performs her journey in 43½ hours, while the first coaches which ran on the same road took 15 or 16 days. The original Edinburgh and Glasgow coach, which was commenced about 1765, took twelve hours to perform the journey, and a swifter vehicle afterwards introduced, the *Fly* as it was termed, still consumed nearly the whole day on the road. The coaches now complete the journey in five hours; there are daily eighteen or twenty running betwixt the towns, and the same increased facilities of travelling are established in every other direction throughout the kingdom."

SPORTING IN INDIA.

Shortly after my arrival at Calcutta, I was invited to a day's sporting by Major—. We started before day-break, in a style more resembling the march of a corps d'armee, or a triumphal procession in honour of the goddess of the chase, than the preparations for a day's hunting. No Scottish laird, Yorkshire squire, nor our Melton Mowbray sportsmen, can conceive any object so to it; our strength and numbers, our arms and appointments, our slaves and attendants, were astounding to behold. A tiger-hunt was the object in view, and a grand and memorable day we had. The major, a fine portly man, was mounted on an elephant, from the elevation of which, placed in a castle, he scoured the circumjacent country with eagle eye, preceded by sharpshooters, trail-blazers, and savants, and followed and surrounded by his brother sportsmen, comrades, and domestics. We were not long before we found a tiger, which afforded considerable sport, and was killed by a brother officer's rifle. From the dingle in which we found the last ferocious animal, we proceeded on with nobler game in view—the monarch of all beasts of prey; and after some extensive riding, a magnificent lion made its appearance. The sight was most grand, but I confess that at this moment no small degree of fear mingled with my ambition to have to record a lion-hunt amongst the adventures of my life. The attack seemed more like actual war than anything else, so great and grand was the enemy to which we were opposed. The bold major and a dashing young cavalry subaltern discharged their rifles simultaneously at the lion, and each of them wounded him. Infuriated with pain, the ferocious animal attacked the elephant, whilst the major seized another rifle and took deliberate aim at him; but being anxious that this shot might tell, he leaned so far forward that he overbalanced himself, and fell from his castle into the lion's arms (or rather paws). Here was an awful moment!—but, wonderful to tell, the major got off with a broken arm only, a rush having been made towards the lion, whereby he was dispatched, covered with wounds, and torrents of blood streaming from his wounds. He could be so brave, so desperate, nor so marvellous!—*Metropolitan.*

HINDOO MARTYRDOM.

Colonel Tod, in his *Annals of Rajasthan*, thus describes a voluntary martyr:—"We have seen one of these objects, self-condemned never to lie down during forty years, and there remained but three to complete the term. He had travelled much, was intelligent and learned, but, far from having contracted the moroseness of the recluse, there was a benignity of mien, and a suavity and simplicity of manner in him, quite enchanting. He talked of his penance with no vain-glorious, and of his approaching term without any sensation. The resting position of this Druid (*vanu-purita*) was by means of a rope suspended from the bough of a tree, in the manner of a swing, having a cross-bar, on which he reclined. The first years of this penance, he says, were dreadfully painful; swollen limbs affected him to that degree, that he expected death; but this impression had long since worn off. Even in this, there much vanity; and it would be a nice point to determine whether the homage of the crowd, the approval of the Divinity, most sustains the energies under such appalling discipline."

BRITISH CAPITAL.

The habitual gloomy anticipations of many individuals in relation to the ideal decline of Great Britain, and the consequent to be expelled on a due consideration of the vast resources of its inhabitants. Their industry, their intelligence, and their amount of capital, or savings from their labour, are altogether unexampled in any history, and are unceasing in their operation. The political economist may occasionally have reason to grieve over some temporary depression in trade, but he should not forget the strength which the people every where possess, of annually accumulating several millions of new capital, and which no effort could extinguish. The intense and prevalent desire of working for and accumulating capital, never ceases in Great Britain under any circumstances, and is the main security against all national misfortunes. The people of other countries may amuse themselves alternately with a fiddle and a musket; but the inhabitants of our impregnable island engage in more laborious and profitable pursuits, and hence their incalculable opulence, and the indestructibility of their power.

PROGRESS OF BRITISH COMMERCE.

It was under the administration of Lord Chatham, in the very midst of a seven years' war, says Dupin, that we behold the commencement of all those great interior works useful to commerce, which are now the admiration of every foreigner. Up to 1756, England had not a single line of artificial navigation; and she possessed, for communication by land, only a small number of roads injudiciously cut and ill kept up. Of a sudden, an individual conceived the idea to profit by the general impulse which industry has received, by cutting a canal, to carry to Manchester the produce of his mines. Shortly afterwards, a town which thrives, and of which the exuberant wealth seeks every where productive outlets—Liverpool—aspires to still higher designs. She is the first to form and to realise the project of opening a navigable channel betwixt the Irish Sea and the German Ocean. Other channels, more or less extended are established by degrees in both ends of the island; and thus, within the short space of half a century, a line of canals is formed, both for great and for small navigation, for the purpose of uniting opposite seas—basins separated by numberless chains of hills—opulent ports—industrious towns—fertile plains—and inexhaustible mines. The total length of canals in Great Britain, excluding those under five miles in length, was, in 1823, 2380 miles. The system of turnpike roads embraced an extent of 24,531 miles in the same year, of which the annual revenue was £1,214,716.

Moles, piers, lighthouses, have been newly established, and the security of access and shelter of every anchorage upon the whole line of coast greatly increased. Such has been the progress of British commerce—a progress which the disastrous war with our American colonies slackened, but could not interrupt—a progress which received new life by the loss of these very colonies—a progress which above all was advanced with gigantic strides during the tremendous struggle, whether right or wrong, maintained so long with the republic and the empire of France!—*Bell's Popular and Scientific Geography.*

EMIGRATION.—NEW YORK.

MR FERGUSSON'S "Notes made during a visit to the United States and Canada, in 1831," published in the *Agricultural Journal* for March last, are of a more light and amusing nature than his previous article on Emigration, yet abound in details worthy of being known by those who design to proceed to America either as travellers or settlers. He thus describes his landing in the United States:—

"The scenery of the American coast is rather tame; but the Bay of New York, after passing the forts, is magnificent, and the approach to the city very fine. We got ashore about three o'clock, and were conveyed in a particularly clean and neat hackney-coach to the Mansion-house Hotel in Broadway, kept by Mr Bunker. I was struck with the superior character of the hackney-horses to those of our cities, and I may add also of those in cars and waggons. They were all in excellent plight, and the latter, if not equal in size to those in English drays, infinitely surpassed them in action. The hackney-coach fares in New York are high, and are moreover annoying to strangers, from the practice of paying for each passenger, when exceeding one, and also for luggage. New York is well provided with hotels of every degree. Our accommodation at Bunker's was excellent. The house is extensive, though not so much so as the City Hotel, where two hundred beds are made up; and the style of living appears to me sufficiently convenient and agreeable. Besides occasional guests, you meet with a certain number of permanent boarders, sometimes whole families remaining for weeks together, with whom strangers enjoy the utmost facility of forming an acquaintance; and as it frequently happens that some of the inmates are members of Congress or of the State Legislatures, and that most of them are men of superior information, an opportunity is afforded of acquiring knowledge regarding the institutions and habits of the people, highly to be prized.

The Americans appeared to me perfectly accessible, and quite ready to give counsel or assistance to all who were disposed frankly and cordially to accost them. Before I was two days in the hotel, I could reckon several very kind friends, acquired entirely in the ordinary intercourse of the day, without any formal introduction, and was not only furnished with routes for my future guidance, but received kind and pressing invitations to visit various individuals in the course of my tour.

The public rooms in the hotels consist of one or more well-furnished drawing-rooms, where you receive visitors, assemble before meals, or spend the evening with music, &c. Single gentlemen, unacquainted or unconnected with any lady of the party, appear to me hardly expected to join the drawing-room circle, although there is no exclusion, nor any difficulty when one is so inclined, in finding admission. The dining-room is of course large, commonly two apartments thrown into one, and capable of being enlarged or contracted at pleasure. In Bunker's, I admired an ingenious communication with the kitchen, by means of a stair concealed under a large sideboard, from one end of which the good-humoured shining phiz of a black waiter was ever and anon emerging with some savoury dish. The bar-room and open gallery or verandah are the only scenes of smoking to be met with in respectable hotels. A book is kept in the bar, where arrivals and departures are regularly recorded, and which frequently enables friends to trace each other with much convenience.

The hotels are well fitted up, the bedrooms not very large, but clean and comfortable, and in Bunker's we found excellent warm baths. Our board was two dollars, or 9s. per day, for which we had breakfast, dinner, tea, and supper, with a bedroom. Our fare was quite excellent. Fish and fowl, rump steaks, sausages, omelets, &c. &c., are kept in constant requisition, and ample justice is done to them, with a dispatch somewhat startling to a stranger. At this time *shad* reigned supreme at our breakfast, as *striped bass* did at our dinner table, both uncommonly delicate varieties of fish.

To those who have formed an estimate of American hotels from certain modern tourists, I am aware that my report may wear the aspect of partiality; yet I feel a pleasure, while I consider it a duty, with perfect indifference and candour, to state the impression made upon myself, and the results of my own experience and observation.

In treating of America, the man who would do her justice must have in constant remembrance the extraordinary advances and improvements which even a year or two in this country produce. In the hotel where I now lived, an English gentleman informed me, that only a few years ago not more than two or three single bedrooms could be found, whereas it is now entirely different, and the change in ordinary road taverns is alike remarkable. We have been accustomed to hear a great deal of the saucy or sulky demeanour of the attendants: not a solitary instance of the kind occurred in my experience; and I found

all my personal wants quite as regularly attended to as I could possibly desire, both in New York and elsewhere; with this essential improvement, that you are relieved of those vexatious extortions which assail you, as 'riders to the bill,' in every British hotel. The attendants, except in the slave states, are almost always free persons of colour; and I believe the repugnance felt to the designation of *servant* arises from some latent ill-defined dread of being mistaken for *slaves*.

That matters are conducted very differently from what we are used to meet with in our own admirable houses of entertainment, I readily admit; but cannot, upon the whole, allow that the absence of snug parlours or mahogany boxes is attended with those very *fatal* effects to comfort and good living, which some smart writers would have us to believe. One grievance perpetually served up is, the shocking inconvenience of travellers being obliged to conform to the regular hours of a public table—a truth which amounts precisely to nothing, these hours being invariably calculated to suit the motions of public conveniences, by which travelling, I may say, is exclusively accomplished in America, and because there is no difficulty in procuring private rooms or *extra* meals, when circumstances oblige you to call for them.

Another very pretty topic of abuse is the *wholesale ablution* system carried on in the tavern-rooms, with the accompaniments of a comb and hair-brush, suspended *pro bono publico*. The climate, in summer, renders washing at every stage extremely comfortable during the few minutes employed in changing horses, and a basin and towel are placed at hand for the purpose. It is only in *very* humble quarters, indeed, that you cannot command these comforts in your own bedroom where you stop for the night; and although certainly the above articles could not present themselves unless they were in use, I scarce recollect observing a single traveller without his pocket-comb.

New York has been so often and so well described, that it is unnecessary to speak in detail of its public buildings and institutions. It is a fine commercial city, with a population of nearly 200,000, carrying on an immense traffic with the whole world. The celebrated Broadway somewhat disappointed me. Its length is certainly very great, and handsome public buildings, private mansions, hotels, and well-furnished shops or stores, are curiously intermixed; while its whole length and breadth are alive with carriages and waggons, equestrians and pedestrians of every rank and of almost every hue. Still it did not equal the expectations which I had been led to form.

"I could say much, were it proper, of the hospitality of New York, and of the unostentatious kindness with which my letters of introduction were received. The style of living is elegant and comfortable; and the domestic circles which I had the pleasure of joining seemed truly unaffected and happy. The quiet, modest, and amiable tone of female society, particularly pleased me."

MANUFACTURES IN METAL.

ALTHOUGH the globe on which we live presents but few traces of metallic veins on its surface, and at the period of its creation probably presented even fewer than it does at present, it is nevertheless an undoubted fact, that so soon and progressively as what may be called the arts of life took place of the primitive rudeness of nature, mankind appear to have discovered and turned to account the various metals within their reach. Nor should the observation, however trite, be discarded, that it is a striking illustration of the providence of the Creator, that those metals which are the most useful are likewise the most abundant, though it must at the same time be remarked they are the most difficult of access.

Mineralogists have started the puzzling question, whether all the mineral treasures which have been extracted from, and those at present existing in, the bowels of the earth, were formed like the materials amidst which they mostly lie, at the creation, or whether they may not, at least in many cases, have been the production of subsequent periods, either resulting from some of those singular phenomena which are obviously attributable to a deluge, or from chemical changes perpetually going on according to fixed laws throughout all the regions of nature with which we are acquainted.

With respect to the existence of gold as a primary element of our globe, we appear to have the affirmative testimony of Moses in the second chapter of Genesis, where, mentioning the situation of Eden, he likewise describes the four heads of the rivers by which the garden was watered, and says, "The name of the first was Pison; that it which compasseth the whole land of Havilah, where there is gold, and the gold of that land is good." This is certainly the earliest instance on record in which mention is made of the existence of any metal.

The presence of gold, silver, lead, and probably copper, must in the earliest times have become, in various ways, too obvious to allow the art of smelting the ores to have remained long undiscovered. The detection of virgin pieces, or the accidental effect of fires upon the more fusible ores, are circumstances which account at once for the early notions and strange fictions which existed among the ancients on this subject; especially the natural and poetical idea of the

conflagration of forests by the rubbing of trees against one another during a high wind, and the consequent fluxion of some of the metals from ores lying exposed on or near the surface.—*Lardner.*

SPERMACETI WHALE.

This animal is commonly from fifty to sixty feet long, although individuals eighty feet in length may be seen. The body has the form of an immense cylinder, of which the head, separated by a slight depression from the back, constitutes a large portion, and is terminated anteriorly by a square mass. The spout-hole is at the anterior extremity of the head, in the middle of a round prominence formed of thick fibres, which serve to close it. The body is generally covered with small, white scales, which pass into the enormous fin, composed of two lobes, deeply notched in the middle, and fourteen feet in its transverse diameter. The pectoral fins are small, of an oblong form, and placed near the commissure of the mouth. The back, which is round and smooth, is surmounted by a false fin, or rather a bump, formed entirely of cellular tissue, in a thick fold of the skin. Sometimes there are two or three of these prominences. The eyes are very small, black, and, what is singular, the right eye is much larger than the left. The general colour is black, with a white line, or rather a silver band, on the sides and belly. Sometimes the under part of the body is whitish. The epidermis is so thick and insensible, that it is commonly covered with large shells like a rock. It commonly swims very slowly, and shows at the surface only the great arch of its back, and the fleshy eminence which surrounds the spout-hole. It often remains at rest for some seconds, and then sinks slowly into the sea. At certain seasons, however, it becomes more active, raising its shapeless head above the surface, and plunging perpendicularly, so as to strike the huge lobes of its fins, which are supposed to be commonly found in the seas of all parts of the world. Davis' Straits, the temperate seas of Europe, the coasts of Patagonia, those of Madagascar, the west coast of New Holland, the Moluccas, Caroline and Marian Islands, the Gallapagos, New Zealand, and the Japanese Archipelagoes, are the places most frequented by them. It appears to live principally upon cuttlefish, and other molluscous animals, fishes, and, as is said, sharks. Two valuable substances are extracted from this whale, namely, blubber and baleen. The Greenlanders make coats of its intestines, and ropes of its tendons. The teeth are employed for numerous domestic uses, and are held in the highest estimation by the natives of many of the South Sea Islands.

AN AMERICAN SETTLER.

Mr Macgregor, whose work on British America has just appeared, thus describes the condition of an American settler in New Brunswick:—"Near where the road parts off from Fredericton, an American, possessing a full share of the adventurous activity of the citizens of the United States, has established himself. He told me that when he planted himself there, seven years before, he was not worth a shilling. He has now (1839) more than three hundred acres under cultivation, an immense flock of sheep, horses, several cows, and a number of swine. He has a comfortable two-story dwelling-house, conveniently furnished, in which he lives with his family and a numerous train of labourers, one or two other houses, a forge, with a powerful trip-hammer worked by water-power, fulling-mill, grist-mill, and two saw-mills—all turned by water. Near these, he showed me a building, which he said he erected for the double purpose of a school and chapel, the floor of which was laid, and on which benches were arranged so as to resemble the pit of one of our theatres. He said that all preachers who came in the country were invited to the use of it. An English person, a Catholic priest, a Presbyterian minister, or a Methodist preacher, should each, he said, get something to eat at his house, and have the use of the chapel, with equal satisfaction to him. He then showed me his barn, and in one place was a heap containing about 90 bushels of Indian corn, that grew on a spot scarcely an acre, which he pointed out to me. This man could do little more than read and write. His manners were quite unpolished, but not rude; yet he had wonderful readiness of address, and as far as related to his business results, quickness of invention and execution. He had raised large crops of wheat, and his own saw-mill manufactures flax he cultivated and the wool of his sheep into coarse cloths—sold the provisions which his farm produced, and rum and British goods to the lumberers—kept a tavern—employed lumberers in the woods—and received also timber in payment for whatever he sold. He made the axes and other tools required by the lumberers, at his forge; he ate, gambled, and associated with his own labourers, and with the lumberers, and all others, who made his house a kind of rallying point; he appeared, however, to be a sober man, and, generally speaking, a good one. He was a very intelligent man, engaged in; he talked much in praise of the rich interior country, and how rapidly it would be settled and cultivated, if possessed by the Americans."

TOAST OF A SCOTCH PEER.

Lord K—, dining at Provost S—'s, and being the only peer present, one of the company gave a toast, "The Duke of Buccleuch." So the peerage went round till it came to Lord K—, who said he would give them a peer, which, although not toasted, was of more use than the whole. His lordship gave "The Pier of Leith."

DUMFRIES CHURCHYARD.

The intelligent inhabitants of Dumfries possess the distinction, which is, perhaps, not very generally known, of paying much greater attention to the condition and appearance of their places of sepulture than any other people in Scotland. St Michael's churchyard, in which repose the ashes of Burns, is the chief *tion* of the place, and abounds in monumental erections of great beauty, executed at all the quiet and most other towns. The ingenious Mr Diarmid, who is unremitting in his statistical inquiries, mentions in one of his publications, that "of the first class of monuments, there are one hundred and nine, many of them designed and executed in Edinburgh, at an expense of upwards of *six hundred guineas*. The Dumfries prices being moderate, and taking L.40 as the average of the whole, we have (says he) a total of *£43,600* expended on the monuments of the first class, and exactly 712. The rates at which these are executed at home vary exceedingly, from the great diversity of size, form, ornament, &c. While some are erected for L.5, there are many that cost more than double that sum; and my informant assures me that there would be nothing approaching to extravagant calculation, in assigning L.9 as the medium. But, in addition to the modern and perfect monuments, there are about 1,000 of the second class, which are dilapidated; and if we apply the same rate to these, the total amounts to L.13,600. Of head-stones in tolerable preservation, the number is 216—the cost about L.600. Of portions of burying-ground, inclosed and uninclosed, with stone and railing, the number is 118; and though they vary greatly as to form and dimensions, they cost, on the whole, L.1,000, reckoning the low rate at L.1500; and when these sums are put together, we find a total of upwards of twenty thousand pounds sterling, independently of the expense of Burns's mausoleum."

CRIME AND POPULATION.

In a Report of the Society for Improving Prison Discipline, it is mentioned, that the amount of crime in proportion to population is as follows:—England, 1 criminal in 740 of the people; in Wales, 1 in 2380; in Ireland, 1 in 2000; in Scotland, 1 in 1830; in Denmark, 1 in 1700; in Sweden, 1 in 1500; in the United States of America, 1 in 3500; and in New South Wales, 1 in 22. Gratifying as it may be to perceive that there is much less crime in Scotland than in any other part of the United Kingdom, it is melancholy to reflect, that every year it is steadily increasing, and, if not checked, will ere long arrive at the same proportion as in England.

HENRY ERSKINE.

The honourable Henry Erskine being one day in London, in company with the Duchess of Gordon, he asked her, "Are we never again to enjoy the honour and pleasure of your Grace's society at Edinburgh?" "Oh!" said she, "Edinburgh is a vile, dull place; I hate it." "Madam," replied the gallant barrister, "the sun might as well say, 'There's a vile dark morning, I cannot rise to-day'."

DRAKE'S FIRST VIEW OF THE PACIFIC.

It was in this expedition across the Isthmus of Panama, that Drake, from the first sight of the Pacific, received that inspiration which, in the words of Camden, "left him no rest in his own mind till he had accomplished his purpose of sailing an English ship in the Pacific." The opening of the Isthmus, the subject of the beginning of this volume, is in one original history so interesting and picturesque, that we transfer it without mutilation:—"On the twelfth day we came to the height of the desired hill (lying east and west like a ridge between the two seas), about ten of the clock, and there we landed, and our captain, by the hands of the Indians, and prayed him to follow him. Here was that goodly and great high tree, in which they had cut and made divers steps to ascend near the top, where they had made a convenient tower, wherein they had placed a great piece of ordnance, and a great number of men. From the Atlantic Ocean we came from, and the south Atlantic so much desired. South and north of this tree they had felled certain trees, that the prospect might be the clearer. After our captain had ascended, to this tower with the chief Symoner, and having, as it pleased him, looked about him, he said to our captain, 'I have seen the land, that sea of which he had heard such golden reports, be besought of Almighty God of His goodness to give him life and leave to sail once in an English ship in that sea; and then, calling up all the company, he said, 'I have seen the land, especially with this petition and purpose, if it should please God, to grant him that happiness.'—*Edinburgh Cabinet Library.*"

COLUMN FOR ANGLERS.

Embow'ed upon the pleasant banks of Thames,
Or by the silver stream of Isis, Cam,
Or yellow Avon, roaming, the angler
Joyous pursues from morn till eve his sport.

AGAIN returns the fresh and cheering month of April, "full of lusti-hed, and wanton as a kid;" with its capricious smiles and showers, its sunny and dull weather, its green fields, its buds and blossoms, and promise of approaching happy summer. With the reviving movements of nature, the crowded streets begin to hang heavy on the "man about town," and the light-hearted juvenile pants to be on the margin of some sparkling and moody stream, trolling for a finny prey, or gently touching the surface of the rippling waters with his fly. For the last six weeks he has been looking forward to "some time about the middle of April," when, on a bright fresh morning, he would find himself on the top of one of the outward-bound coaches of the metropolis, the close thoroughfares gliding rapidly behind him, the prospect of fields and hedgerows opening in the distance, and the piscatorial delights of the morrow brightening up in his fancy. Kind reader, need you ask where these fishing streams are to be found? Are there not hundreds in broad Scotland, from the vales of Tweed and Yarrow, to those of the Dee and the Ythan? All less or more abound in trout and minor fish, while few are without the most delicious salmon. Dumfriesshire, too, has its excellent streams; Ayrshire has a number pouring their waters into the Western Sea; Lanarkshire has its Clyde and a variety of lovely tributaries; and Perthshire abounds in delightful streams of first, second, and third-rate size, all valuable in the eyes of the bait and fly-fisher. For the last six weeks, I say, the angler has been busily conning over all these things in his mind; overhauling his well-stuffed pocket fly-book, examining his lines, dusting and renovating his panner, and carefully tying up the auspicious-looking cracks in his angling rod. Old Izaak Walton, and Charles Cotton's "Complete Angler," he has long since learned by heart, for he makes it one of his companion books on the chimney-piece in winter—he has perused all the tracts on the subject, including that of Bainbridge; and, if I be not sore mistaken, has lately lounged with a degree of delight over "Salmonia, or Days of Fly-fishing." But your real angler needs no instruction; he is wise by intuition; and he forms a theory of fishing entirely his own, which he would not give for all the theories which ever were written. To the old angler, therefore, who is already "up" to every thing about his craft, I do not say one word; but taking the young incipient fisher—the candidate for piscatorial honours—under my auspices, I would beg to give him a few friendly directions as to the best means of carrying on his operations.

The chief care of the angler should be to procure a good rod, lines, hooks, and floats. The rod should consist of five or six pieces, fitted so nicely that the whole, when joined, may appear to be one piece. Those living near streams use spliced rods, which are much better than those with ferules and screws, as they bend throughout, and are not so liable to break; but anglers who have to travel can seldom with convenience carry rods which are tied instead of screwed. A trouting rod is usually made from twelve to sixteen feet in length, though some prefer them of greater extent, as giving more command over wide streams and pools. Good fishers, who are not afraid of catching cold, prefer to wade and fish from the centre of streams rather than the bank, by this means commanding the eddy corners and ripples on both banks. In all the great angling matches on the Tweed, the competitors plunge into the stream, as being their only method of securing

ing a basketful of trout. The rod ought to be perfectly elastic, and finely tapering to a point made of whalebone, or the most delicate hickory.

The lines of the angler may be bought from the tackle-makers; horse hair is preferred; it should be round, twisted even, and of equal thickness; the best colours are white and grey for clear waters. Chestnut or brown-coloured hairs are best for ground angling, especially in muddy water; black is occasionally used in streams of a dark mossy hue. The line-reel, or *pirn*, should hold about 80 or 90 yards, so as to admit abundance of line being given out when required.

In the spring months most river fish will catch at worm or other bait which requires no very particular art in managing; the bait being suffered to sink towards the bottom of the water, where it is trolled for a short space before taken out. In fly-fishing, however, will be found the principal sport, and of the various fish, trout will afford the most agreeable prey. For nine months in the year, under favourable circumstances, fly-fishing may be practised with success. Westerly and southerly winds are the most favourable, especially in spring; but during warm and cloudy summer weather, the point from which the wind blows is of little consequence. Whoever desires to become a successful practitioner in the art, must angle in all weathers, and under every variety of circumstances, however unpropitious the prospect may be. Trout are generally supposed to rise more freely during a dark and lowering day, following a clear bright night, as brilliant moonshine detains them in their lurking places. On the other hand, after a gloomy or darkish night, they are less easily tempted, having glutted themselves with moths or other nocturnal insects, which, during the summer months, are abundant in the waters. In throwing the line, the angler should endeavour to make his gear fall as lightly as possible on the surface, and his flies should drop opposite or somewhat above his own position, and then be played gently and neatly downwards and across the stream. When a trout is seen to rise at a natural fly or other insect, the artificial one should be offered him by being thrown, not directly over him, but about a yard higher up the stream; and if he is inclined to rise again, he will probably meet it half way. When a fish, on being hooked, descends beneath the surface, and struggles in the depths below, it is a pretty sure sign that he is well secured; but when he flounders on the surface, or leaps occasionally into the air, more care is necessary, as in that case the hook will frequently be found to be only skin-deep. In playing and landing a large trout, the same precautions are necessary as in salmon fishing, although, in regard to swollen fish, if the angler be standing in the centre of a stream, and finds it inconvenient to wade frequently ashore, a few additional turns will exhaust the captive, which may be drawn rapidly and steadily to the hand, and secured by a firm grasp behind the gills.

A recent writer in the *Encyclopædia Britannica* states it as his opinion that fly-fishing, by far the most elegant and interesting branch of the art, ought not to be regarded exclusively as an art of imitation. "It no doubt," he says, "depends on deception, but the great object of the fly-fisher is to dissimulate in such a manner as to prevent his expected prey from detecting the artificial nature of his line, without troubling himself by a vain effort to stimulate or assume, with his fly, the appearance of any individual or specific form of insect life. There is in truth little or no connection between the art of angling and the science of entomology; and, therefore, the success of the angler in by far the greater proportion of cases, does not depend on the resemblance which subsists between his artificial fly and the natural insect. This statement is, no doubt, greatly at variance, as well with the principles as the practice of all who have deemed fishing worthy of consideration; but we are not less decidedly of opinion, that in nine cases out of ten a fish seizes upon an artificial fly as upon an insect or moving creature, and not on account of its exact and successful resemblance to any accustomed and familiar object. The same observations apply, with almost equally few exceptions, to bait fishing. The minnow is fastened upon swivels, which cause it to revolve upon its axis with such rapidity, that it loses every vestige of its original appearance; and in angling with the par tail—one of the most killing lines for large trout—the bait consists of the nether half of a small fish, mangled and misshapen, and in every point of view divested of its natural form. We are therefore of opinion, that all, or a great proportion of what has been so often and sometimes so well said about the great variety of fish necessary to an angler—about the necessity of changing his tackle according to each particular month throughout the season—about one fly being adapted solely to the morning, another to noonday, and a third to the evening—and

about every river having its own particular flies, &c., is, if not erroneous, at least exaggerated and misconceived. That determinate relations exist between flies of a certain colour and particular conditions of a river, is, we doubt not, true; but these are rather connected with angling as an artificial science, and have little to do with any analogous relations in nature. The great object, by whatever means it is to be accomplished, is to render the fly deceptive; and this, in fact, we believe to be more frequently effected when fishing with flies which differ in colour and general appearance from those which are upon the water. When a particular fly prevails upon a river, an artificial one in imitation of it will never resemble it so closely as to appear the same to those below (*i. e.* the fish); on the contrary, a certain degree of resemblance, without any thing like an exact similitude, will only render the finny tribe the more cautious through suspicion; while a different shape and colour, by exciting no minute or invidious comparisons, would probably have been swallowed without examination. How often has it been asserted, with all the gravity of sententious wisdom, that the true mode of proceeding in fly-fishing is to busk your hook by the river side, after beating the shrubs to see what colour of insect prevails! A very expert angler, who perhaps carried the opposite theory rather too far (although he always filled his pannier), was in the habit of stirring the briars and willows to ascertain what manner of fly was *not* there, and with that he tempted the fishes."

It would be difficult to describe to the inexperienced the variety and character of the artificial fly which he ought to use. A good authority in this matter recommends, for April, a stone-fly, the body made of dark wool dyed yellow, under the wings and tail. For the beginning of May, a ruddy fly, made of red wool, and bound about with black silk, with the feathers of a black cock hanging dangling on his sides next his tail. The hazel-fly is a killing fly in May and June; the body is composed of ostrich hair of two colours, black and purple twisted together; the wings of the sandy coloured feathers from under the wings of a thrush, or the reddish plumes of a partridge's tail; a bluish hackle, twisted and pretty full, serves both for the underwings and legs. For June, a greenish fly may also be used; the body is made of black wool, with a yellow list on either side; the wings taken off the wing of a buzzard, bound with black broken hemp. The Moorish fly, the body made of dusty wool, and the wings of the blackish wail of a drake. The tawny fly, which is in great repute till the middle of June; the body made of tawny wool, the wings contrary, one against another, composed of the whitish wail of a white drake. For July, the wasp fly; the body made of black wool, cast about with yellow silk, and the wings of a drake's feathers. The steel fly, approved in the middle of July; the body made of greenish wool, cast about with the feathers of a peacock's tail, and the wings made with cock's hackle. When rivers are very low and clear, from a long continuance of summer drought, it has been recommended to use a pair of wings made from the feather of a landrail, or the mottled feather of a teal, with a well-cleaned gutter fixed upon the hook. During a similar condition of the water, even when no wind is stirring, and the sun shining in its greatest lustre, trouts may be taken with a small *wren's tail*, *grouse*, *smoky dun*, or *black hackles*, the angler fishing straight down the water, by the sides of streams and banks, and keeping well out of sight, with as long a line as can be neatly managed. At these times the fish may be seen with their dorsal fins above water, and with skilful management may be made to snap at the above-named flies. When one is hooked, the rest dart off; but if the angler keeps concealed, they will return again in a very short time; and thus several fish may be taken even in summer from the clearest pools. In fishing a river with which the angler has no previous acquaintance, the most approved practice is to try the eddies which are frequent at the corners of the streams, and where the circular movement of the current throws out a frequent sustenance for the finny race. There the larger trout often lie; and it must consist with the experience of every angler, that an excellent capture is sometimes made repeatedly from some small spot behind or beside a particular stone, where from day to day one well-sized fish seems to succeed another in the favourite feeding ground. In this knowledge of peculiar localities, consists the chief advantage of a previous acquaintance with the water. The smaller fish are found in most abundance in the widely-spread and shallow streams, as well as in the extended parts of pools of no great depth. The tributary streams of main rivers have also in general the smallest fish, and such are much easier caught than the trout of the larger waters. Out of the tributaries of the Tweed—the Manor for instance—I remember, while a boy, of sometimes taking not less than two dozens of small trout in a day, which was reckoned a small number; and indeed this species of small-stream fishing seems most adapted to, and is best conducted by youth, the older fishers, in most instances, despising this "trifling" sport.

The philosophy of angling, or its power of producing salutary meditation in the perhaps wearied mind, has been a theme for many ages, and not without good reason. There are certainly "pleasures in fishing which none but fishers know," and which could hardly be appreciated were they to be specified to the uninitiated. Let me conclude my COLUMN FOR ANG-

ERS in the simple madrigal of old Izaak, the father of the craft:—

As inward love breeds outward talk,
The hound some praise, and some the hawk;
Some, better pleased with private sport,
Use tennis, some a mistress court;
But these delights I neither wish
Nor envy, while I freely fish.

THE VOICE OF SPRING.

[BY FELICIA HEMANS.]

I come, I come! ye have call'd me long,
I come o'er the mountains with light and song!
Ye may trace my step o'er the wakening earth,
By the winds which tell of the violet's birth,
By the primrose-stars in the shadowy grass,
By the green leaves opening as I pass.
I have breathed on the South, and the chestnut flowers
By thousands have burst from the forest bowers,
And the ancient graves, and the fallen fane,
Are veil'd with wreaths on Italian plains.
—But it is not for me, in my hour of bloom,
To speak of the ruin or the tomb!
I have pass'd o'er the hills of the stormy North,
And the larch has hung all his tassels forth,
The fisher is out on the sunny sea,
And the rein-deer bounds through the pasture free,
And the pine has a fringe of softer green,
And the moss looks bright where my step has been.
I have sent through the wood-paths a gentle sigh,
And called out each voice of the deep blue sky,
From the night-bird's lay through the starry time,
In the groves of the soft Hesperian clime,
To the swan's wild note by the Iceland lakes,
When the dark fir-bough into verdure breaks.
From the streams and founts I have loosed the chain
They are sweeping on to the silvery main,
They are flashing down from the mountain-brows,
They are flinging spray on the forest boughs—
They are bursting fresh from their sparry caves,
And the earth resounds with the joy of waves.
Come forth, O ye children of gladness, come!
Where the violets lie may be now your home.
Ye of the rose-cheek and dew-bright eye,
And the bounding footstep, to meet me fly,
With the lyre, and the wreath, and the joyous lay—
Come forth to the sunshine, I may not stay!
Away from the dwellings of care-worn men,
The waters are sparkling in wood and glen,
Away from the chamber and dusky hearth,
The young leaves are dancing in breezy mirth
Their light stems thrill to the wild-wood strains,
And youth is abroad in my green domains.
But ye! ye are changed since ye met me last;
A shade of earth has been round you cast!
There is that come over your brow and eye,
Which speaks of a world where the flowers must die!
Ye smile! but your smile hath a dimness yet—
Oh, what have ye look'd on since last we met?
Ye are changed, ye are changed!—and I see not here
All whom I saw in the vanished year!
There were graceful heads, with their ringlets bright,
Which toss'd in the breeze with a play of light;
There were eyes, in whose glistening laughter lay
No faint remembrance of dull decay.
There were steps, that flew o'er the cowslip's head,
As if for a banquet all earth were spread;
There were voices that rung through the sapphire sky,
And had not a sound of mortality!
—Are they gone?—is their mirth from the green hills
pass'd—
Ye have look'd on death since ye met me last!
I know whence the shadow comes o'er ye now,
Ye have strewn the dust on the sunny brow!
Ye have given the lovely to earth's embrace,
She hath taken the fairest of beauty's race!
With their laughing eyes and their festal crown
They are gone from amongst you in silence down.
They are gone from amongst you, the bright and fair—
Ye have lost the gleam of their shining hair!
—But I know of a world where there falls no blight,
I shall find them there, with their eyes of light!
Where death 'midst the blooms of the morn may dwell,
I tarry no longer—farewell—farewell!
The summer is hastening, on soft winds borne,
Ye may press the grape, ye may bind the corn!
For me, I depart to a brighter shore;
Ye are mark'd by care, ye are mine no more.
I go where the loved who have left you dwell,
And the flowers are not death's—fare ye well, farewell!

ROTATION OF CROPS.

The fact has been long known to gardeners and farmers, that they could not get good crops of the same kinds from the same piece of ground, season after season, though the cause of this has only been investigated of late years, and has been proved, by experiments of Brugman and Macaire, not to arise, as formerly alleged, from the food in the soil being exhausted—since all plants feed nearly alike—but from the excrementitious slime which acts upon the same sort of plant that produces it as poison. Thus the slime from a crop of cabbages will greatly injure another crop of cabbages, though it will do little or no injury to potatoes or peas: while the slime from peas will injure peas, though it may not injure cabbages or turnips. When this is known, it will prevent two successive crops of the same kind from being tried, unless the ground be so trenched and dug as to bury the slime deeper than the roots can reach. In many parts of Ireland, and probably of Scotland, the slime from potatoes is so mixed with the soil that a good crop of potatoes cannot be had.—*Rennie's Hand-Book of Gardening.*

BITE OF VENOMOUS INSECTS.

When the usual remedies of sucking, scarification, and burning with a hot iron, have failed, the Tartars lay their patient on his back, and make him swallow as much milk as he can imbibe. He is then packed away into a box or basket, having a long rope attached to each end of it, and this rope is passed above through a strong hook or ring. After being swung up, he is rocked and shaken about for five or six hours, without intermission, by two men, who relieve one another at the task; or else, the basket is made to revolve until the rope becomes twisted and shortened, and then the attendant lets it suddenly go, so that it whirls round with tremendous rapidity until it touches the ground. Either of these methods produces dizziness and other ailments, whence ensue vomiting, perspiration, and breaking of wind, and, what is much better than these, an effectual cure.—*Strauss's Travels in Tartary.*

VARIETY OF HABIT IN SPIDERS.

The habits of spiders vary greatly. Some rest in the centre of their webs, the outstretched cordage of which warns them of the temporary entanglement of their prey, on which they instantly rush, and devour, after the infliction of a mortal wound. Others seek the protection of a leaf or other natural harbour, and only appear in the more open parts of their premises when lured by an expected capture. Many spin comfortable tunnels, or horizontal watch-towers, as they may be called, in which they repose till the vibration of their nets calls them into active service. An extensive tribe of erratic species (the *Vagabunda*) spin no webs at all, but trust to strength, activity, and cunning, for their daily, or, it may be, monthly fare; for spiders, though voracious in times of abundance, are capable of frequent and long-continued abstinence. The webless species are often endowed with the faculty of leaping, and after insidiously approaching their prey by the most wary and almost imperceptible footsteps, they spring upon it at once, and inflict the fatal wound. Several kinds hunt down their insect food by speed of foot; and a few are nocturnal, and surprise their defenceless and unsuspecting victims during the darkness of the night.—*Encyc. Brit. new edit.*

CRAB FISHERS.

Brickell gives an interesting account, in his *History of North Carolina*, of the wonderful cunning manifested by the racoon in that country. It is fond of crabs, and, when in quest of them, will take its station by a swamp, and hang its tail over into the water, which the crabs mistake for food, and lay hold of it; as soon as the racoon feels them pinch, he pulls up his tail with a sudden jerk, and they generally quit their hold upon being removed from the water. The racoon instantly seizes the crabs in his mouth, removes them to a distance from the water, and greedily devours his prey. He is very careful how he takes them up, which he always does from behind, holding them transversely, in order to prevent them catching his mouth with their nippers.

THE CIRCULATING MEDIUM.

To count 5,000,000 of guineas, at the rate of a guinea every second, and working two hours a-day, would employ one person nearly four months. A refinement in giving velocity to the circulating medium is practised by about two-thirds of the private bankers of the metropolis. According to the report of the bullion committee, the daily payments made to these bankers amounted on an average to £4,700,000. If that sum were to be paid daily by one debtor to his creditor, without the intervention of banking, and in coins, even of gold of one guinea each, the multitude of people that would be required to convey the specie from place to place would crowd the metropolis from one end to the other, since even more than £4,700,000 would probably be wanted. To make payments in all the variety of sums which would be necessary by the customers of the whole bankers, and the Bank of England, it might require 5, 10, or perhaps 20 times £4,700,000 daily; as the matter, however, is contrived, instead of this enormous sum of £4,700,000 in coin, these daily payments, amounting in a year to £1,457,000,000, are made by means of the comparatively trifling sum of £2,200,000 daily for 310 days, or £68,000,000 yearly. The merchants agree that their orders on their respective bankers shall not be presented until the end of the day, when the bankers meet, and settle and exchange all the drafts and orders on each other, paying the difference in bank notes, which is calculated to amount, on an average, to £2,200,000 a-day. If about two-thirds of the private bankers in London pay £1,500,000,000 yearly for a part of their customers, how much must that yearly sum be increased by what the whole of the bankers and the Bank of England pay, including the public revenue and loans! When it is considered also that this vast and almost incalculable number of payments are all accomplished by means of about £2,200,000 in bank notes and gold coins, the velocity of its circulation will appear to be most truly astonishing.—*Bell's Popular and Scientific Geography.*

ADVENTURE WITH AN ALLIGATOR.

In the height of the dry season, when in those torrid regions all animated nature pants with consuming thirst, a party of the wood-cutters, English and Irish, went to hunt in the neighbourhood of a lake called Pies Pond in Beef Island, one of the smaller islands of the Bay of Campeachy. To this pond the wild cattle repaired in herds to drink, and here the hunters lay in wait for them. The chase had been prosecuted with great success for a week, when an Irishman of the party, going into the water during the day, stumbled upon an alligator, which seized him by the knee. His cries alarmed his companions, who, fearing that he had been seized by the Spaniards, to whom the island belonged, and who chose the dry season to hunt and repel their unwelcome neighbours, instead of affording assistance, fled from the bays which they had erected. The Irishman, seeing no appearance of help, with happy

presence of mind quietly waited till the alligator loosened its teeth to take a new and surer hold; and when it did so, snatched away his knee, interposing the butt-end of his gun in its stead, which the animal seized so firmly that it was jerked out of the man's hand and carried off. He then crawled up a neighbouring tree, again shouting after his comrades, who now found courage to return. His gun was found next day dragged ten or twelve paces from the place where it had been seized by the alligator.—*Edinburgh Cabinet Library.*

GREAT STRENGTH OF THE BEAR.

Captains Lewis and Clarke, in their *Travels to the Source of the Missouri*, give the following striking instance of the astonishing physical powers of the bear, which proves that he is a formidable enemy to encounter:—"One evening, the men in the hindmost of the canoes discovered a large brown bear lying in the open grounds, about three hundred paces from the river. Six of them, all good hunters, set out to attack him; and concealing themselves by a small eminence, came unperceived within forty paces of him. Four of them now fired, and each lodged a ball in his body, two of them directly through the lungs. The enraged animal sprang up, and ran open mouthed at them. As he came near, the two hunters who had reserved their fire gave him two wounds, one of which, breaking his shoulder, retarded his motion for a moment; but before they could reload, he was so near that they were obliged to run to the river, and when they reached it, he had almost overtaken them. Two jumped into the canoe; the other four separated, and, concealing themselves in the willows, fired as fast as each could load. They struck him several times, which only exasperated him; and he at last pursued two of them so closely, that they leaped down a perpendicular bank of twenty feet into the river. The bear sprang after them, and was within a few feet of the hindmost, when one of the hunters from the shore shot him in the head, and killed him. They dragged him to the banks of the river, and found that eight balls had passed through his body."

MENTAL FORTITUDE DEPENDENT ON HABIT.

When life is in danger, either in a storm or a battle, it is certain that less fear is felt by the commander or the pilot, and even by the private soldier actively engaged, or the common seaman laboriously occupied, than by those who are exposed to the peril, but not employed in the means of guarding against it. The reason is not that the one class believe the danger to be less. They are likely in many instances to perceive it more clearly. But having acquired a habit of instantly turning their thoughts to the means of counteracting the danger, their minds are thrown into a state which excludes the ascendancy of fear. Mental fortitude entirely depends on this habit. The timid horseman is haunted by the horrors of a fall. The bold and skilful thinks only about the best way of curbing or supporting his horse. Even when all means are equally unavailable, and his condition appears desperate to the bystander, he still owes to his fortunate habit that he does not suffer the agony of the coward. Many cases have been known where fortitude has reached such strength, that the faculties, instead of being confounded by danger, are never raised to their highest activity by a less violent stimulant. The distinction between such men and the coward does not depend on difference of opinion about the reality or extent of the danger, but on a state of mind which renders it more or less accessible to fear.—*Encyclopædia Britannica.*

USE OF THE SEA BENT.

The Norwegian peasants have been lauded for their dexterity in manufacturing numerous utensils with the aid of no other instrument than a hatchet, a saw, and a knife; and the Highland peasant has been represented as deficient in industry and ingenuity, because he has not succeeded in producing the like marvels. But the depreciators of the "unfortunate Celt" should have first learned, that many districts afford no wood of any kind upon which he could exercise his ingenuity, and that the drift timber which the Atlantic carries to his shores has invariably been taken by the lairds and factors. There remain for him but a few grasses and other herbaceous vegetables on which to try his skill. The most important of these is the land or sea bent, *Arundo arenaria*. When cut before the seeds have ripened, the leaves of this grass possess a great degree of tenacity, in consequence of which they have been converted to many important uses. It is made into ropes of various kinds for the accoutrement of their horses, securing their corn stalks and thatch roofs, for chair bottoms, mats for winnowing corn, and vessels of various kinds for holding and preparing grain and meal. For the latter purpose, it is twisted, and the different rounds are bound together by the long, slender, and very tough roots, which the plant sends into the sand-banks often to the length of twenty feet. Some of the smaller of these vessels are hardly inferior in beauty to those which the Caffres form of better materials. The mats are woven of small ropes in a frame. Sacks and bags for holding grain, meal, and wool, are made in the same manner. In short, this important plant has been applied to all imaginable purposes. But in future it will be less useful to the poor tenants, owing to the care which the proprietors have begun to take of the sandy pastures; and, in truth, the digging for the roots of this grass and of the *Galium verum* cannot fail to be productive of much injury to such pastures.

RIVERS.

The sources of the greatest rivers are not the most remarkable for the features that surround them. The sources of the mighty rivers of the western hemisphere, or even of the great rivers of Africa or Asia, have not, as far as is known, been visited by the traveller, with the single exception of the Nile; their sources are probably placed amid those unapproached solitudes, where the foot of man has never yet wandered; what appearances of nature may preside over their birth we have no means of knowing; but it does not appear from the narrative of

Bruce that the source of the Nile afforded any example of extraordinary sublimity. The sources of the large rivers of the European continent are many of them well known; but the sources of neither the Rhine, the Rhone, nor the Danube, present those majestic and imposing features that distinguish the sources of some of the smaller class. Nor is this difficult to explain. The large rivers have not one, but many sources; and as the source, *par excellence*, we mount to the highest, which invariably lies among the upper fields of snow. The smaller rivers, on the other hand, may gush at once from a single spring, placed perhaps among the rocks, and ravines, and precipices, which lie lower than the line of congelation. It is, at all events, a fact, that the most sublime sources are those which belong to the smaller rivers.—*Monthly Magazine.*

SEA-FIGHT OF THE BUCCANEERS IN THE BAY OF PANAMA.

Before the Buccaneers had finished consultation on their plan of operation, the Spanish fleet advanced upon them, and battle was resolved upon. And "lying to windward of the enemy, we had it not," says Dampier, "in our choice whether to fight or not. It was three o'clock in the afternoon when we weighed, and being all under sail, we bore down right afore the wind on our enemies, who kept close on a wind to come to us; but night came on without any thing beside the exchanging of a few shot on each side. When it grew dark, the Spanish admiral put out a light as a signal for his fleet to come to anchor. We saw this light at the admiral's top for about half an hour, and then it was taken down. In a short time after we saw the light again, and being to windward, we kept under sail, supposing the light had been in the admiral's top; but, as it proved, this was only a stratagem of theirs, for this light was put out the second time at one of the barks' topmast head, and then she was sent to leeward, which deceived us, for we thought still the light was in the admiral's top, and by that means ourselves to windward of them." At day-break, the Buccaneers found that by this stratagem the Spaniards had got the weatherage of them, and were bearing down full sail, which compelled them to run for it; and a running fight was maintained all day, till, having made a turn almost round the bay, they anchored at night whence they had set out in the morning. Thus terminated their hopes of the treasure-ships.—*Edinburgh Cabinet Library.*

FOOTMARKS OF MAN AND LOWER ANIMALS.

Voltaire, in *Zadig*, has attributed to his hero a sagacity in tracing footsteps, which no doubt has often been considered an idle conceit. Such a power, however, appears not only to the Arabs to a degree which deserves the name of the marvelous. The Arab, says Burckhardt, "who has applied himself diligently to the study of footsteps, can generally ascertain, from inspecting the impression, to what individual of his own, or some neighbouring tribe, the footprint belongs, and therefore is able to judge whether it was a stranger who passed or a friend. He likewise knows, from the slowness or depth of the impression, whether the man who made it carried a load or not. From a certain regularity of intervals between the steps, a Bedouin can judge whether that man, whose feet left the impression, was fatigued or not, as, after fatigue, the pace becomes more irregular and the intervals unequal: hence he can calculate the chance of overtaking the man. Besides all this, every Arab knows the printed footsteps of his own camels, and of those belonging to his immediate neighbours. He knows by the depth or slowness of the impression whether a camel was pasturing, and therefore not carrying any load, or mounted by one person only, or heavily loaded. If the marks of the two forefeet appear to be deeper in the sand, he concludes that the camel had a weak breast, and this serves him as a clue to ascertain the owner. In fact, a Bedouin, from the impression of a camel's or of a driver's footsteps, draws so many conclusions, that he always learns something concerning the beast or its rider. In some cases this mode of acquiring knowledge appears almost supernatural. The Bedouin sagacity in this respect is wonderful, and becomes particularly useful in the pursuit of fugitives, or in searching after cattle. I have seen a man discover and trace the footsteps of his camel in a sandy valley, where a thousand of other footsteps crossed the road in every direction; and this person could tell the name of every one who had passed there in the course of the morning. I myself found it often useful to know the impressions made by the feet of my own companions and camels; as from circumstances which inevitably occur in the Desert, travellers sometimes are separated from their friends. In passing through dangerous districts, the Bedouin guides will seldom permit a townsman or stranger to walk by the side of his camel. If he wears shoes, every step he passes will excite the impression that some townsman has travelled that way; and if he walk barefooted, the mark of his step, less full than that of a Bedouin, immediately betrays the foot of a townsman little accustomed to walk. It is therefore to be apprehended that the Bedouins, who regard every townsman as a rich man, might suppose him loaded with valuable property, and accordingly set out in pursuit of him. A keen Bedouin goes constantly and exclusively on foot, and during his march, in examining footsteps, and frequently alights from his camel to acquire certainty respecting their nature. I have known instances of camels being traced by their masters during a distance of six days' journey, to the dwelling of the man who had stolen them. Many secret transactions are brought to light by this knowledge of the footsteps; and a Bedouin can scarcely hope to escape detection in any clandestine proceeding, as his passage is recorded upon the road in characters that every one of his Arabian neighbours can read."—*Burckhardt.*

INSTINCTIVE LOVE OF FLESH IN TIGERS.

A party of gentlemen from Bombay, one day visiting the stupendous cavern temple of Elephanta, discovered a tiger's whelp in one of the obscure recesses of the edifice. Desirous of kidnapping the cub, without encountering the fury of its dam, they took it up hastily and cautiously, and retreated. Being left entirely at liberty, and extremely well fed, the tiger grew rapidly, appeared tame and fondling as a dog, and in every respect entirely domesticated. At length, when it had attained a vast size, and, notwithstanding its apparent gentleness, it began to inspire terror, by its tremendous powers of doing mischief; a piece of raw meat, dripping with blood, fell in its way. It is to be observed that, up to that moment, it had been stupidly kept from raw animal food. The instant, however, it had dipped its tongue in blood, something like madness seemed to have seized upon the animal—a destructive principle, hitherto dormant, was awakened—it darted fiercely, and with glaring eyes, upon its prey—took it with fury to pieces, and growling and roaring in the most fearful manner, rushed off towards the jungles.—*Brown's Anecdotes.*

EDINBURGH: Published, weekly, by W. and R. CHAMBERS, 19, Waterloo Place; ORR & SMITH, Paternoster-row, London; and GEORGE YOUNG, Dublin. Agent in Glasgow, JOHN MACLEOD, 20, Argyle Street; and sold by all other Booksellers in Great Britain and Ireland.

Subscribers in town may have the paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

From the Steam-Press of W. and R. CHAMBERS.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM CHAMBERS, AUTHOR OF "THE BOOK OF SCOTLAND," "GAZETTEER OF SCOTLAND," &c.

No. 12.

SATURDAY, APRIL 21, 1832.

PRICE THREE HALFPENCE.

SUBJECTS OF CONVERSATION.

SUBJECTS of conversation are sometimes exceedingly difficult to be had. I have known many a company of well-dressed men and women feel themselves most awkwardly situated for want of something to talk about. The weather, which is said to be a never-failing subject, cannot hold out above a few minutes at a time. It will stand a round or two rounds, but not more. It is then knocked up for the evening, and cannot with decency be again brought forward. Being thus disposed of, the subject of "news" is tabled; but, as a matter of course, there being "no news stirring," "not a word," "nothing in the papers," that subject is also soon dispatched. If there happen to be any very remarkable occurrence worth talking of, what a blessing it is on such occasions! It is food for the company a whole night, and may be again and again brought above-board for their amusement. But it much more frequently happens that there is no exciting event to talk about, and then the condition of the company is truly miserable. There being ladies present, or there being two factions in the room, politics are proscribed; and even if they could be brought forward, the question of reform immediately comes in with all its tiresomeness, and is put down by general consent. Every attempt at getting up a topic failing, the company look into the fire, or in each other's faces, or begin to examine with much interest the pattern of the carpet; and the silence which ensues is truly terrific. A slight whisper is the only sound in the apartment, and is caught at or watched by the company, for it may chance to be the commencement of a conversation in which they may join, without exciting particular attention. But it, too, dies away. It was only a passing under-current of remark, between the two married ladies in the blue and white turbans, on the dearth of coals, the difficulty of getting good servants, or the utility of keeping children muffled in flannel nightgowns from October till March. At length some good soul makes an effort to brush away his diffidence. He projects a remark across the room towards the little man with the smirking countenance, about Mr This, or Miss That, or Signor Such-a-thing, who are at present enlivening the town with their exhibitions. The remark is in itself a very ordinary remark, but it has its use; it quickens the intellects of those who hear it, and the tongues of a number of individuals are set a-going upon the subject of theatrical amusements, singing in the Assembly Rooms, Pasta, Paganini, and private parties, so that the original remark is lost sight of, and the company go on pretty well with what it has produced, for perhaps half an hour. All these topics being exhausted, another horrible silence ensues. The company again look into the fire, or in one another's faces, and once more examine the carpet. What is to be said next? All think upon saying something, yet nobody speaks. The national *mauvaise honte* is now displayed to the height of its perfection. The agony of the company, however, approaches its crisis. The awful stillness is broken, and in a most natural and unexpected manner. The young man in the starched cravat sitting in the corner of the room, near the end of the piano, who has been thinking what he shall say or do for the last half hour, takes heart of grace; he rises and snuffs the candles, going through the self-imposed duty in as neat and elegant a style as he can possibly affect. The snuffing of the candles is an operation which every member of the company has seen performed ten thousand times; but it affords interest for even the ten-thousandth and first time. It may not intrinsically be worth heeding, yet, in a case of this nature, it is of very great importance. It suggests a new theme, and that is exactly what is wanted, for one subject invariably leads to the discussion of half a dozen others. The operation of snuffing the candles, therefore, induces some one to remark, how beautifully gas light is. Then this brings on a disquisition on the danger of introducing it into private houses; its cost in comparison with oil is next touched upon; then follows an observation about the last illumination, which leads to reminiscences of similar displays on the occasions of the great naval victories—the victories lead to Nelson—Nelson, to his biographer Southey—Southey, to poetry—poetry, to Byron—and Byron, to Greece. This whirl of conversation, however, also runs out; an accident jars it, and it is all over. Suddenly the speakers pause, as if they had received a galvanic shock; one small voice is alone

left prominent above the silence; but finding itself unsupported, it is immediately lowered to a whisper, and the whisper subsides to a dead silence.

I have often pitied the host or hostess on occasions of this nature; but I could not help blaming them for not providing against such dismal pauses in the conversation of their parties. To guard against these occurrences, I would recommend them to bring forward what I have remarked to be never-failing sources of conversational entertainment, namely, a tolerably good-looking cat, a lap-dog, or a child. The last is the best. It ought to be about two years of age, and be able to walk. If adroitly played off, or permitted to play, it will amuse the party for an hour at least. It must be placed on the hearth-rug, so as to attract all eyes; and while in the room, no other subject of discourse will be thought of. Any endeavour to draw off attention, by the relation of some entertaining anecdote, will be deemed sedition against the majesty of the household. If a cat, a dog, or an interesting child, cannot be conveniently had, I would advise the invitation of some one who has a loud voice and the happy effrontery of speaking incessantly, however ridiculously, on all subjects; a person who can speak nonsense to any extent, and has the reputation of being a most agreeable companion. This man is of vast use in tabling subjects; for he has no diffidence or modesty, and has a knack of turning every observation to account. His voice also serves as a cover to much bye conversation; there being hundreds who speak fluently enough, provided a bagpipe were kept playing beside them, or who could have their voices drowned by some other species of noise. The loud and voluble talker is therefore an excellent shelter for those of weaker nerves, and will be found a useful ingredient in all mixed companies.

The difficulty of starting subjects of conversation, as well as the difficulty of sustaining them, is often as observable when two acquaintances meet in the street, as when a roomful of company is collected. The unhappy pair exhaust all that they can remember they ought to say to each other, in the space of a minute and a half, and another minute may be consumed in going through the process of taking a pinch of snuff; the next half minute is spent in mutual agony. Neither knows how to separate. As the only chance of release, one of the parties at last brings in a joke, or what is meant to be such, to his aid. The other, of course, feels bound to laugh, and both seizing the opportunity, escape in different directions under cover of the witticism.

STORY OF MRS MACFARLANE.

(Concluded.)

MRS MACFARLANE, the strange lady described at the end of the preceding part of this tale, was the only daughter of a gentleman of Roxburghshire, who had perished in the insurrection of 1715. An attempt was made by his surviving friends to save the estate from forfeiture, so that it might have been enjoyed by his orphan daughter, then just emerged into womanhood. But almost all hope of that consummation was soon closed, and, in the meantime, the unfortunate young lady remained in a destitute situation. The only arrangement that could be devised by the generosity of her friends, was to permit her to reside periodically for a certain time in each of their houses—a mode of subsistence from which her spirit recoiled, but to which, for a little while, she was obliged to submit. It was while experiencing all the bitter pangs of a dependent situation, encountered for the first time, and altogether unexpectedly, that Mr Macfarlane, a respectable and elderly law agent, who had been employed by her father, came forward and made an offer of his hand. Glad to escape from the immediate pain of dependency, even at the hazard of permanent unhappiness, she accepted the proposal, although her relations did every thing they could to dissuade her from a match so much beneath her rank. The proud spirit of Elizabeth Ker swelled almost to bursting, when she entered the dwelling of her low-born husband; and the humble marriage-feast which was there placed before her, seemed in her eyes as the first wages of her degradation. But her own reflections might have been endured, and in time subdued, if they had not been kept awake by the ungenerous treatment which she received from all her former friends. The pride of

caste was at this period unbroken in Scotland, and it rigorously demanded the exclusion of "the doer's wife" from all the circles in which she had previously moved. The stars made a conspiracy to banish the sun. If Mrs Macfarlane had been educated properly, she would have been able to repel scorn with scorn, and, in these tergiversations of the narrow-spirited great, would have only seen their degradation, not her own. But under her deceased mother, a scion of a better house than even her father's, she had grown up in the full participation of all the ridiculous notions as to caste, and of course was herself deeply sensible of the advantages she had forfeited. Rendered irritable in the highest degree by consciousness of her own loss, she received every slight thrown upon her by society into her innermost heart, where it festered and fed upon her very vitals. She found that she had fallen, that the step was irretrievable; and as fictitious degradation, imposed by the forms of society, always in a short time becomes real, her character suffered a material deterioration. She took refuge from offended self-love in a spirit of hatred and contempt for her fellow-matrons, and began to entertain feelings from which, in earlier and happier years, she would have shrunk as from actual crime.

There was at least one branch of the better sort of Edinburgh society which never manifested any disinclination to her acquaintance: this was the class of loose young men of good birth, who daily paraded at the Cross with flowing periwigs and glancing canes, and nightly drowned their senses in a vulgar debauch, from which they occasionally awoke in the morning with the duty of settling scores by a rencontre in St Ann's Yards or at St Leonard's Crags. This set of brawlers, the proper successors of those drunken cavaliers who disgraced a preceding age, subsisted in a state of pure antagonism to the stayed and decorous habits of the general community; many of them were literally the children of cavaliers, and indebted in a great measure for their idle way of life to the circumstances of the government, which dictated an exclusive distribution of its patronage among its own adherents, and of course left the poor Jacobites exposed to all the temptations of idleness. Dicing and golfing were the employments of their forenoons; in the evening they would stagger from table into Heriot's Green or Lady Murray's garden in the Canongate, where they would make a point of staring out of countenance such sober citizens and their daughters as ventured to frequent those fashionable promenades. According to a Presbyterian writer of the day, they sent to London regularly for the last fashions and the newest oaths; but perhaps the latter part of the report is only a scandal. If such personages were to revive now-a-days, and appear some forenoon among the modern *beaux esprits* of Prince's Street, they would be looked upon, with their long wide-skirted coats, and buckles, and cravats, as a set of the most solemn-looking gentlemen; but in their own time there were no ideas associated with them but those of reckless, hot-headed youth, and daily habits the most opposite to those of decency and virtue.

Mrs Macfarlane, whilst she sunk from the society of gentlewomen of her own rank, still retained such acquaintance as she had ever happened to possess, of their wild sons and brothers. With them, she was, in her turn, an object of great interest on account of her transcendent beauty, or rather its fame—for the fame with such persons is of far more importance than the reality. It was not disagreeable to Mrs Macfarlane, when she walked with her husband on the Castlehill, and found herself passed with dry recognition by persons of her own sex, to be made up to by some long-waisted Sir Harry Wildair, who, in language borrowed from Congreve or Farquhar, protested that the sun was much sited in his efforts to illuminate the world by the light of her eyes. A rattle of the fan was the least favour that could be dispensed in reward for such a compliment; and then would ensue a conversation, perhaps only interrupted by a declaration from Mr Macfarlane, that he felt the air getting rather cold, and was afraid to stay out any longer on account of his rheumatism. The society of these fops was never farther encouraged by Mrs Macfarlane; indeed, it was only agreeable to her in public places, where it consoled her a little for the ungenerous slights of more respectable persons. Yet it had some effect upon her reputation, and was partly the cause of her misfortunes.

About two years after the insurrection of 1715, the host of Edinburgh fops received an important accession in Mr George Cayley, a young English gentleman, who was sent down as one of the commissioners upon the forfeited estates. Cayley brought with him a considerable stock of cash, an oath of recent coinage, said to be very fashionable in Pall-Mall, and a vest of peculiar cut, which he had lately got copied at Paris from an original belonging to the Regent Orleans. As he also brought a full complement of the most dissolute personal habits, he might be considered as recommended in the strongest manner to the friendship of the native beaux; if, indeed, his accomplishments were not apt rather to produce displeasure from their superiority. Some days after his arrival, he was introduced to Mrs Macfarlane, to whom he was an object of some interest on account of his concern in the disposal of her father's estate. If she felt an interest in him on this account, he was not the less struck by her surpassing beauty and elegant manners, which appeared to him alike thrown away upon her husband, and the city in which she dwelt. He rushed home from the first interview in a state of mind scarcely to be imagined. That such a glorious creature should squander her light upon the humble house of an attorney, when she seemed equally fit to illuminate the walls of a palace, was in his eyes a perversion of the designs of nature. He wished that it was in his power to fly with her away—away from all the scenes where either was known, to some place far over this world's wilderness, where every consciousness might be lost except that of mutual love. Over and over again he deplored the artificial bonds imposed by human laws, and protected by the virtuous part of the human race, by which hearts the most devoted to each other were often condemned to eternal separation. His heart, he found, was possessed by sensations such as had never before moved it. It worshipped its object as a kind of idol, instead of, as formerly, regarding it as a toy. He flung himself in idea before the shrine of her splendour, in breathless, boundless, despairing passion.

It is probable that if Cayley had been fortunate enough to meet Mrs Macfarlane before she was married, he might have been inspired with an attachment equally devoted, and which, being indulged innocently, might have had the effect of purifying him from all his degrading vices, and raising him into a worthy member of society. As it was, the passion which, in proper circumstances, is apt to refine and humanise, only lent a frantic earnestness to his usual folly. He made it his endeavour to obtain as much of her society as possible—an object in which he was greatly favoured by his official character, which caused him to be treated with much less coolness by Mr Macfarlane than was otherwise to have been expected. That individual had not altogether lost hope of regaining the property to which his wife was entitled, and he therefore met Mr Cayley's advances with more than corresponding warmth, every other sentiment being for the time subordinate to this important object. The young Englishman, in order to cultivate this delightful intimacy with the greater convenience, removed from his former lodgings to a house directly opposite to Mrs Macfarlane's, in the High Street, where, at such times as a visit was out of the question, he would sit for hours watching patiently for the slightest glimpse of her through the windows, and judging even a momentary gleam of her figure within the dim glass as an ample compensation for his pains. He now became much less lively than before—forsook, in some measure, the company of his gay contemporaries—and seemed, in short, the complete *beau-ideal* of the melancholy, abstracted lover. It was his custom to spend most of his evenings in Mrs Macfarlane's house; and, except during those too quickly flying hours, time was to him the greatest misery. Existence was only existence in that loved presence; the rest was a state of dormancy, or watchfulness only to be spent in pain. If he applied at all to the business for which he was commissioned by the government, it was only to that part of it which related to the inheritance of Mrs Macfarlane, in order that he might every night have an excuse for calling upon that lady, to inform her of the progress he was making in her cause. His attachment to that quarter was soon whispered abroad in society; and, while it served as a grateful theme for the tongues of Mrs Macfarlane's former compeers, the favour with which he seemed to be received was equally the subject of envy to the young men, few of whom had ever found much countenance in her house for want of something to recommend them equally to her husband.

Scarcely any thing is calculated to have so deteriorating an effect upon the mind as the constant fret of an unlawful passion. In every one of the clandestine and stealthy operations by which it is sought to be gratified, a step is gained in the downward descent towards destruction. Cayley, who was not naturally a man of wicked dispositions, and who might have been reclaimed by this passion, had it been virtuous, from all his trivial follies, gradually became prepared, by the emotions which convulsed his bosom, for an attempt involving the honour of his adored mistress, and consequently her whole happiness in life, as well as that of many innocent individuals with whom she was connected. This he now only waited for an opportunity of carrying into effect; and it was not long ere it was effected.

Called by the urgent request of a Highland client, Mr Macfarlane had left town somewhat suddenly, and

was not expected to return for upwards of a week. During his absence, Mrs Macfarlane endeavoured to repress the attentions of Mr Cayley as much as possible, from a sense of propriety, and contented herself with a kind of society—dumb, yet eloquent—which she felt to be much more fit for her situation—the society of her infant child. One evening, however, as she sat with her tender charge hushed to sleep upon her bosom, Mr Cayley was unexpectedly ushered in, notwithstanding that she had given directions for his exclusion after a certain hour, now past. To add to her distress, he appeared a little excited, as she thought, by liquor, but in reality by nothing but the burning and madly imprudent passion which had taken possession of him. He sat down, and gazed at her for a few moments without speaking, while she remonstrated against this unseasonable intrusion. She then rung her bell, in order to chide her servant for disobedience of her orders; but Mr Cayley tranquilly told her that he had taken the liberty of sending the girl away upon an errand.

"In the name of heaven," said the lady, "what do you mean?"

"I mean, my dear Madam," answered he, "to have a little conversation with you upon a subject of great importance to us both, and which I should like to discuss without the possibility of interruption. Know, Madam, that, ever since I first saw you, I have fondly, madly loved you. You are become indispensable to my existence; and it depends upon you whether I shall hereafter be the most happy or the most miserable of men."

"Mr Cayley," cried the lady, "what foolery is this? You are not in your senses; you have indulged too much in liquor. For heaven's sake, go home; and to-morrow you will have forgot that such ideas ever possessed your brain."

"No never, my angel!" cried he, "can I forget that I have seen and loved you. I might sleep for ages; and if I awakened at all, it would be with your image imprinted as strongly as ever upon my heart. You now see a man prepared for the most desperate courses in order to obtain you. Listen for a moment. In the neighbourhood a coach stands ready to carry us far from every scene where you have hitherto been known. Consent, and I procure for you (which is now within my power) a reversal of your father's attainer. You shall again possess the domains where your fathers for ages back have been held in almost regal veneration, and where you spent the pleasant years of your own youth. Deny me, and to-morrow your reputation is blasted for ever. The least plausible tale, you well know, would be received and believed by society, if told respecting Mrs Macfarlane."

"Profligate wretch!" exclaimed the unfortunate lady; "can I believe my ears when they tell me that such wickedness exists in a human bosom? Look, sir, at this infant; were there no principles of virtue within me to dictate a contemptuous rejection of your proposals, do you think that I could leave this innocent to pine and die under the cold neglect of strangers, or to survive to a less blessed life with the stigma of a disgraced mother fixed for ever upon her? Were I the basest woman that ever lived, as you seem to think me, would nature permit so awful a violation of her laws? Could I leave my child, and not next moment be struck dead by fire from heaven for my crime? The alternative, indeed, is awful. Well you know the point upon which I am most easily affected. Base, however, as you avow yourself, I cannot yet suppose that you could be guilty of a trick so worthy of the devil himself, as to blast the reputation, where you could not fix the real cause of infamy."

"Do not flatter yourself too much on that score," rejoined Cayley; "you do not now see a man actuated by ordinary principles. I am tortured and confounded by an impetuous passion, which you have excited. If you take from me all hope of a consent to my first proposal, I must endeavour to bring you into my power by the second. To-morrow! did I say? Nay, I will go this night and tell every man I know that you are the slave of my passion. Not a lady in Edinburgh but will know of it to-morrow before she has left her pillow. You will then, I think, see the necessity of consenting to the scheme of flight which I now put into your power."

He pronounced these words in such a disordered and violent manner, that the unhappy lady sat for some time unable to reply. She hardly recovered her senses till she heard the outer door clang behind him, as he went upon the demoniac purpose which he had threatened.

The first place that Mr Cayley went to was John's coffeehouse, a fashionable tavern in the Parliament Square, where he found a large group of his dissolute young friends, drinking claret out of silver stoups. The company was in an advanced stage of intoxication and riot, very much to the annoyance, apparently, of a few smaller knots of decent citizens, who were indulging in some more moderate potations after the fatigues of the day, and endeavouring to understand as much as they could of the London Intelligencer, the Flying Post, and other little sheets of news which lay upon the various tables. "Well, Cayley," cried one of the young roisterers, "come and tell us how you are getting on now with the fair lady over the way—husband not at home—must be making great advances, I suppose." "Make yourself quite at ease on that subject; I am so, I assure you." This he said in so significant a tone, that it was at once understood. A

flood of railery, however, was immediately opened upon him; no one would believe what he said, or rather implied—and thus, as they designed, he was drawn to make much more explicit declarations of his supposed triumph. No attempt was made by himself or others to conceal the subject of their conversation from the rest of the individuals present. It was understood distinctly by the sober citizens above mentioned, some of whom shrugged their shoulders, knocked their cocked hats firmly down upon their heads, took staff in hand, and strode consequentially and indignantly out of the room. As Cayley had predicted, the whole affair was blazoned abroad before next morning.

Mrs Macfarlane, as might be supposed, enjoyed little sleep after the agitations of the preceding evening. She could hardly believe that any thing so wicked as what had been threatened by Mr Cayley could be perpetrated by a being in human shape; but yet, recollecting the extraordinary state in which he seemed to be, she could not altogether assure herself of the contrary. In the forenoon she went to pay a visit in a distant part of the town; and she could not help remarking, that while she seemed to have become an object of additional interest to the male sex, the ladies, even those with whom she had formerly been on terms of civil recognition, averted their eyes from her, with an expression, as she thought, of contempt.

The lady upon whom she called received her in the coldest manner, and, on an explanation being asked, did not hesitate to mention what she had heard as the town's talk that morning, namely, that Mr Cayley professed himself to be her favoured lover. The unfortunate lady burst into a passion of tears and lamentations at this intelligence, protested her innocence a thousand times, and declared herself to be only the victim of a profligate; but still she saw that she did not produce an entirely exculpatory effect upon the mind of her friend. She went home in a state of distress bordering on despair. Her early misfortunes through the severity of the government; her dependent situation in the houses of her kinsfolk; her unhappy marriage to a man she could never love; and, finally, the cruel coldness with which she had been treated by her former friends in the days of her depression, all recurred upon her mind, and, united with the more awful grief which had now overtaken her, prepared her mind for the most desperate resolutions.

Early in the afternoon she sent a note to Mr Cayley, requesting, in the usual terms, the favour of his company. The receipt of her billet threw him into transports of joy; for he believed that his scheme had already taken effect, and that she was now prepared to accede to his proposals. He therefore dressed himself in his best style, and at the proper hour (he felt too secure of his prey to go sooner) walked across the street to his appointment. He was shown into a room at the back of the house, where he had never before been, and where there was little furniture besides a picture of Mrs Macfarlane, painted by Sir John Medina, an Italian artist who long practised his trade at the Scottish capital. This portrait, which he began to gaze upon with all the enthusiasm of a lover, represented his mistress in a style and manner strikingly beautiful. The utmost serenity, united with the utmost innocence, shone in those sweetly noble features. The fair open brow glowed like the summer sky calmly and cloudlessly beautiful. The eyes shone with the lustre of gladness and intelligence, and the whole expression was resolved into an exquisite and killing smile. The lover stood in a sort of transport before this image of all he held dear on earth, as if he were yielding to an idolatrous contemplation of its extraordinary loveliness, when the door was opened—and behold the original! Instead of the voluptuous smile which shone on the canvass of Medina, a beautiful Fury stood before him—a Hecate not yet grown old. He started with horror; for not only did she bear in her countenance the most threatening ensigns of passion, but she carried in her hand two large pistols, one of which she held extended to him, while with the other she locked the door behind her, at the same time keeping a watchful and glaring eye upon her victim.

"Wretch," she said, "you have ruined one who never did you wrong. You have destroyed me as completely as if you had stretched me lifeless beneath your hand. More than this, you have rendered others who are dear to me unhappy for ever. My child—you have deprived her of the nurture of a mother; you have fixed upon her name a stain which will never be washed out. And yet for all this, society, cruel as it is to the victim, provides no punishment—hardly even any censure—to the criminal. Were it now my will to permit you, you might walk away scatheless from the fair scene you had ravaged, with nothing to disturb your triumph, but the lamentations of so many broken hearts. You shall not, however, enjoy this triumph—for here you shall die!"

Cayley had stood for a few moments, gazing alternately at her face and at the weapon she held extended towards him. He heard her address as if he had heard it not. But at the last word, he recovered a little of his presence of mind, and made an effort to approach her. She at that moment fired, but without effect. The effort of drawing the trigger had depressed the muzzle of the weapon, and the ball entered the floor at his feet. She lost not an instant to present and fire the other, the shot of which penetrated his breast, and he fell next moment before her, with but one indistinct murmur of agony—and then all was still.

One brief embrace to her child—a moment at the toilette to arrange her travelling dress, which she had previously prepared, and the beautiful murderess was ready to fly. She instantly left town for the south, and, as already mentioned, received shelter and concealment in the house of her distant kinsman, Sir John Swinton. How long she was there protected, is not known; but it was probably as long as the search of justice continued to be in the least eager. It was always understood, by those aged persons who knew her story, and from whom the preceding facts have chiefly been derived, that she ultimately escaped to some remote continental state, where she was supported by contributions from her relations. So closes one of the most tragical tales that stain the domestic annals of Scotland during the last century.

SCOTTISH NATIONAL INSTITUTIONS.

CRIMINAL LAW.

WHILE the civil law of Scotland possesses few points of similitude to that of England, a difference of the like nature prevails with regard to the criminal jurisprudence of the two nations. In this branch of the Scottish law, certain ancient peculiarities and usages exist which have no parallel in the sister country, or perhaps any part of the world at the present day. The difference between the two codes may be briefly stated:—In England, every possible crime which can be imagined, or which has happened, is met by a statute for its future prevention and punishment; in Scotland, on the other hand, while there are numbers of crimes similarly met by particular legislative enactments, a far greater proportion are dealt with, as they occur, on general principles—thus, the one is called the *Statute Law*, the other, the *Common Law*, and both are the boast of the nations to which they respectively belong. From what I have remarked of the observations of English writers on the criminal law of Scotland, it appears that few understand it thoroughly, and that they are generally ignorant or regardless of many local usages and moral characteristics of the people which influence its operation. Under the statute law, every man is well aware of his danger, when under temptation to commit a misdemeanour, and he may approach the very verge of crime with impunity, even while actually transgressing the moral law. With us, on the contrary, no man may leave the path of rectitude with the expectation that he is safe; and, consequently, he is wary in entering an enclosure in which he may in a moment be surprised. To judge fairly of the properties and value of the two opposite codes of law pointed out, it would be necessary to bring both into view collaterally with the other institutions of the country; for by doing so, it would be found that the mischiefs of a too scrupulous regard to statutes on the one side, and an apparent danger in the dispensation of general law on the other, were in a great measure neutralised by minute provisions, not seen until the forms are nearly examined. This is more observable in the Scotch than the English law, and a comparison of their merits would incline me to prefer the former, on the score not only of vigour, but humanity. The criminal statute law of England is allowed to be sanguinary, and I am afraid, it is very elusory. Besides, even granting that its alleged minuteness might be beneficial, its unintelligibility, from a concurrence of enactments, many hundreds of which have been rescinded, extended in their meaning, or obscured by others more recent, renders the whole one of the most contradictory and useless codes of jurisprudence in the world.

The most obvious mischief in the statute law is the permission it gives to commit new offences, as well as an allowance to go within a hair-breadth of an actual infraction of old ones; thereby confusing ideas of right and wrong. Hume, a popular Scotch writer on criminal law, points out the superiority of the common over the statute law, in these words:—An incipient desire to commit crime in Scotland “is repressed in its beginning, and more effectually than it can ever be by any statute, because all statutes are liable to be partial and defective in their description of offences; and thus the transgressor finds the means of eluding the sanction, and the law itself falls into contempt. But it is also a merciful course to the offender; because the crime, being censured on its first appearance, and before it has become flagrant or alarming to the community, is restrained at that season by far milder correctives than are afterwards necessary to be applied to it, when the growing evil has come to require the passing of an express law in its behalf. Thus in England the sending of incendiary or threatening letters is punished with death, in virtue of certain statutes which passed at a time when this sort of wickedness prevailed. But our judges punished the first offender of this sort (whose trial was within these fifty years) with transportation; and it has never been found necessary to seek authority of any higher or more rigorous punishment. The same is true with regard to the corruption or alteration of bills, promissory notes, and the like, to the prejudice of the acceptor, which by certain statutes is felony without benefit of clergy in England, and is punishable with us at common law with transportation. Many other examples might be given. In short, if things are to be judged of upon the testimony of experience, and not according to the fallacious conjectures of human wisdom before the event, the inhabitants of Scotland have

no reason to envy the condition, with respect to the administration of criminal justice, of any other part of Europe.”

Though this eulogium on the superiority of Scotch criminal law be correct, in so far that in many cases a leniency is exercised in Scotland which would not have taken place in England under like circumstances, it is but justice to say, that there could likewise be produced evidence where undue severity, according to the caprice of judges, has been inflicted. Nevertheless, if we examine the conduct of judges in recent times, and bring to remembrance some particular subsidiary checks which frustrate the malignity of prosecution, we have not much to regret that the criminal law is so ill defined in its properties. It is confessed that at one period, and that too not of a distant date, the will of judges, aided by the dependent character of juries, and the trammels under which the press laboured, tended to lower the respectability of our criminal jurisprudence; but I am strongly inclined to think that a very different line of procedure would in the present time be adopted.

Whatever may be the expression of the statutes in reference to particular crimes, it is a certain fact, that in almost all cases of misdemeanour or infraction of the laws, the character of the culprit sways both the public prosecutor and the minds of the judges. On many occasions, neither have it in their power to do otherwise than apply the exact punishment, or to divert the regular course of justice, leaving the mitigation of the penalty to his Majesty; but more ordinarily they have it in their power to modify the asperity of the law, according to circumstances. The chief guiding legal principle in a Scottish criminal prosecution, is the strict attention which is paid to the former good or bad character of the accused. The English statute law in some instances provides a higher degree of punishment for the commission of a crime for the second time; but in bringing an individual to trial, it does not rest any plea upon his having been simply a bad character, either supposed or established; and this acts as a slight check to the general severity of the law. In being subjected to a criminal prosecution in Scotland, the law acts very differently. When an accusation is laid for a specified crime, accompanied with the charge of being “*habiti et repute*” an evil doer, the indictment rises prodigiously in value, and the punishment is inflicted with a rigour which, in a case without such an aggravation, would be entirely unknown. To be habit and repute a thief or other felon, was at one time a most dangerous property. It could have formed the sole ground of indictment, and, if proved, might have been punished by scourging, imprisonment, and even transportation from the kingdom. It has long since been disused on these unduly severe terms, and now acts only as an aggravation of the special charges.

The law of habit and repute has been denounced by various writers as ungenerous, and the mention of such a singular mode of making up a charge may perhaps excite the contempt of a stranger; but really, though apparently mischievous at first view, it seems on all occasions to be used to great advantage in clearing society of only its worst characters. In no case is it stretched to the extent of depressing a criminal who may have in former times been known to live a course of iniquity, and after betaking himself to an honest mode of life for some years, again relapsed into crime. It is only applied to those who are caught in the midst of their career of wickedness, and have been a torment to society. It has the incalculably beneficial effect of raising a distinction between the hardened ruffian, and the unfortunate poverty-propelled infringer of the laws for the first time,* although both be charged with the commission of nominally the same crime.

English criminal statutes are often very explicit in regard to the penalty to be incurred by stealing articles of a particular value—raising the punishment in proportion as the price rises in amount. The law of Scotland makes little or no difference in the degree of punishment it inflicts on this score. When a larceny is committed to the extent of thirty shillings, the penalty will be as severe as if it were to the amount of forty shillings, or forty pounds. On this account, that species of ridiculous straining of counsel in England, to make it appear on trial that the value of goods stolen was beneath a certain amount, is never witnessed in this country. It is the characteristic of habit and repute, which here as every where else regulates the penalty; and it may often have occurred, that while one man, who has been charged with stealing forty shillings' worth of goods, has been only doomed to three months' imprisonment, another for a larceny of twopenny has been transported, or even hanged. The charge of stealing a pair of old shoes, of threepence in value, as a witty writer notices, and with being at the same time *habiti et repute* a thief, if proved would bring the prisoner by law to the gallows, when, without this qualification, a very modified degree of punishment, such as a few

days' imprisonment, would be inflicted. In practice, such cruelty is avoided by the temperate and adroit management of the public prosecutor, who uses his discretion in restricting the penalty; and so happily is this generally done, that in Scotland none but the most debased criminals, in whom no redeeming property can be discovered, are put to death on the scaffold.

The office of *Lord Advocate*, or General Public Prosecutor, just alluded to, will form the subject of my next paper on the Scottish National Institutions.

THE STOLEN PRESIDENT.

THE custom of stealing away town-bailies and councillors, so as to balk the election of a particular member of Parliament, and which is of no very rare occurrence in Scotland, meets with a parallel in early periods of our history in the abduction of persons of considerable influence in the state or on the bench. An incident of this nature, illustrative of the former unsettled state of the country, may here be related for the amusement of my readers:—

In the reign of Charles I., when the moss-trooping practices were not entirely discontinued, the tower of Gilnockie, in the parish of Cannoby, was occupied by William or Willie Armstrong, a lineal descendant of the famous John Armstrong of Gilnockie, executed by James V. The hereditary love of plunder had descended to this person with the family mansion; and upon some marauding party he was seized and imprisoned in the tolbooth of Jedburgh. The Earl of Traquair, Lord High Treasurer, happening to visit Jedburgh, and knowing this border moss-trooper, inquired the cause of his confinement. Willie replied, he was imprisoned for stealing two *tethers* (halters), but, upon being more closely interrogated, acknowledged there were two *delicate colts* at the end of them. The joke, such as it was, amused the earl, who exerted his interest, and succeeded in releasing Willie from bondage. Some time afterwards, a lawsuit of importance to Lord Traquair was to be decided in the Court of Session, and there was every reason to believe that the judgment would turn upon the voice of the presiding judge, who has a casting vote in case of an equal division among his brethren. The opinion of the president was unfavourable to Lord Traquair; and the point was, therefore, to keep him out of the way when the question should be tried. In this dilemma, the earl had recourse to Willie Armstrong, who at once offered his service to kidnap the president. Upon due scrutiny, he found it was the judge's practice frequently to take the air on horseback on the sands of Leith without an attendant. In one of these excursions, Willie, who had long watched his opportunity, ventured to accost the president, and engage him in conversation. His address and language were so amusing, that he decoyed the president into an unfrequented and furzy common, called the Figgate Whins, where, riding suddenly up to him, he pulled him from his horse, muffled him in a large cloak which he had provided, and rode off with the luckless judge trussed up behind him. Will crossed the country with great expedition, by paths known only to persons of his description, and deposited his weary and terrified burden in an old castle in Annandale, called the Tower of Graham. The judge's horse being found, it was concluded he had thrown his rider into the sea; his friends went into mourning, and a successor was appointed to his office. Meanwhile, the poor president spent a heavy time in the vault of the castle. He was imprisoned, and solitary; received his food through an aperture in the wall, and never hearing the sound of a human voice, save when a shepherd called his dog by the name of *Batty*, and when a female domestic called upon *Maudie*, the cat. These, he concluded, were invocations of spirits, for he held himself to be in the dungeon of a sorcerer. At length, after three months had elapsed, the lawsuit was decided in favour of Lord Traquair, and Will was directed to set the president at liberty. Accordingly, he entered the vault at the dead of night, seized the president, muffled him once more into the cloak, without speaking a single word; and using the same mode of transportation, conveyed him to Leith sands, and set down the astonished judge on the very spot where he had taken him up. The joy of his friends, and the less agreeable surprise of his successor, may be easily conceived, when he appeared in court to reclaim his office and honours. All embraced his own persuasion that he had been spirited away by witchcraft; nor could he himself be convinced of the contrary, until, many years afterwards, happening to travel in Annandale, his ears were saluted once more with the sounds of *Maudie* and *Batty*, the only notes which had so laced his long confinement. This led to a discovery of the whole story; but in these disorderly times it was only laughed at as a fair *ruse de guerre*. Wild and strange as this tradition may seem, there is little doubt of its foundation in fact. The judge upon whose person this extraordinary stratagem was practised, was Sir Alexander Gibson, Lord Durie, collector of the reports well known in the Scottish law under the title of *Durie's Decisions*. He was advanced to the station of an ordinary Lord of Session, 10th July 1621, and died at his own house of Durie, July 1646.

* There was once a curious merciful peculiarity in the Scottish law, by which any person in a famishing condition, or in a state of general destitution, could steal with impunity as much food as he could carry away on his back; and which usage is noticed by institutional writers under the name of the law of *burthynack* or *burthynack*. It has been long completely in desuetude, but it is nevertheless remarkable, that many of the lower orders of people have still an idea that persons dying for lack of food may help themselves from the store of others by force, without incurring a judicial penalty.

SCOTTISH JESTS AND ANECDOTES.

DR ADAM SMITH.

This distinguished philosopher was remarkable for absence of mind, for simplicity of character, and for muttering to himself as he walked along the streets. As an anecdote of the first peculiarity, it is related of him, that, having one Sunday morning walked into his garden at Kirkcaldy, dressed in little besides his nightgown, he gradually fell into a reverie, from which he did not awaken till he found himself in the streets of Dunfermline, a town at least twelve miles off. He had in reality trudged along the king's highway all that distance, in the pursuit of a certain train of ideas; and he was only eventually stopped in his progress by the bells of Dunfermline, which happened at the time to be ringing the people to church. His appearance in a crowded street, on a Scotch Sunday morning, without clothes, is left to the imagination of the reader.

It is told, as an example of the second peculiarity, that on the evenings of those very days which he had devoted to the composition of the *Wealth of Nations*, he would sometimes walk backwards and forwards through his parlour, waiting for an opportunity when he might abstract a lump of sugar from the tea-table, unobserved by his housekeeper, who exercised a kind of control over him.

It used to be related of him, that one day, as he was muttering very violently to himself, in passing along the streets of Edinburgh, he passed close to a couple of fishwomen, who were sitting at their stalls. At once putting him down for a madman at large, one remarked to the other, in a pathetic tone, "Hech! and he's weel put on too;" *id est*, well dressed; the idea of his being a gentleman having of course much increased her sympathy.

LORD KAIMES.

Lord Kaimes, it is very well known, paid great and successful attention to the improvement of agriculture. A great number of years ago, a German quack, who called himself Baron Von Haak, vaunted of having discovered a powerfully fertilising manure, which he advertised for sale, pretending that a very small quantity sufficed to fertilise an acre of land in a very extraordinary manner. Happening to converse with one of his neighbours upon this subject, a plain sagacious farmer, the farmer observed to Lord Kaimes that he had no faith in the baron's nostrum, as he conceived the proposed quantity vastly too small to be of any use. "My good friend," said Lord Kaimes, "such are the wonderful discoveries in science, that I should not be surprised if, at some future time, we might be able to carry the manure of an acre of land to the field in our coat pocket!" "Very possibly," replied the farmer; "but, in that case, I suspect you will be able to bring back the crop in your waistcoat pocket."

INTESTINAL WARDROBE.

An ancestor of Sir Walter Scott joined the Pretender, and with his brother was engaged in that unfortunate adventure, which ended in a skirmish and captivity at Preston, 1715. It was the fashion of those times for all persons of the rank of gentlemen to wear scarlet waistcoats. A ball had struck one of the brothers, and carried a part of his dress into his body; and in this condition he was taken prisoner, with a number of his companions, and stript, as was too often the practice in these remorseless civil wars. Thus wounded, and nearly naked, having only a shirt on, and an old sack about him, the ancestor of the great poet was sitting, along with his brother and a hundred and fifty unfortunate gentlemen, in a granary at Preston. The wounded man fell sick, as the story goes, and vomited the scarlet, which the ball had forced into the wound. "Oh, man, Wattie!" cried his brother, "if you have got a wardrobe in your wame, I wish you would vomit me a pair of breeks, for I have meikle need of them." The wound afterwards healed.

ANECDOTE OF SPEAKING OUT IN CHURCH.

A most amusing instance of *speaking out* in church occurred some years ago in the parish of —. The minister, in preaching upon the story of Jonah, uttered a piece of declamatory rhetoric, to something like the following effect:—"And what sort of a fish was it, my brethren, that God had appointed thus to execute his holy will. Was it a shark, my brethren? No—it could not be a shark; for God could never have ventured the person of his beloved Prophet amongst the deadly teeth of that ravenous fish. What fish was it, then, my brethren? Was it a salmon, think ye? Ah no; that were too narrow a lodging. There's no ae salmon i' the deepest pule o' a' Tweed could swallow a man. Besides, ye ken, it's mair natural for men to swallow salmon, than for salmon to swallow men. What, then, was it? Was it a sea lion, or a sea horse, or a sea dog, or the great rhinoceros? Oh, no! These are not Scripiter beasts ava. Ye're as far aff't as ever. Which of the monsters of the great deep was it, can ye tell me?" Here an old spectacled dame, who had an eleemosynary seat on the pulpit stair, thinking that the minister was in a real perplexity about the name of the fish, interrupted him with, "Hoot, sir, it was a whale, ye ken." "Out upon ye, ye graceless wife that you are!" cried the orator, so enraged as almost to fly out of the pulpit at her, "thus to take the word out of the mouth of God's minister!"

IMPROMPTU OF SIR WALTER SCOTT.

When Monsieur Alexandre, the celebrated ventriloquist, was in Scotland, he paid a visit to Abbotsford, where he entertained his distinguished host, and the other visitors, with his unrivalled imitations. Next morning, when he was about to depart, Sir Walter Scott felt a good deal embarrassed as to the sort of acknowledgment he should offer; but at length resolving that it would probably be most agreeable to the young foreigner to be paid in professional coin, if in any, he stepped aside for a few minutes, and on returning, presented him with the following epigram. To English readers it must be explained, that Sir Walter holds the situation of sheriff of the county of Selkirk.

Of yore, in old England; it was not thought good
To carry two visages under one hood;
What should folk say to you? who have faces such plenty
That from under one hood you last night show'd us
twenty!

Stand forth, arch deceiver, and tell us in truth,
Are you handsome or ugly, in age or in youth?
Man, woman, or child—a dog or a mouse?
Or are you, at once, each live thing in the house?
Each live thing did I ask?—each dead implement too,
A workshop in your person—saw, chisel, and screw!
Above all, are you one individual? I know
You must be at least Alexandre and Co.

But I think you're a troop—an assemblage—a mob,
And that I, as the sheriff, should take up the job;
And instead of rehearsing your wonders in verse,
Must read you the riot act, and bid you disperse.

CHOOSING A PROFESSION.

An old Scotch laird, who was engaged in selecting a liberal profession for his son, thus delivered his thoughts upon the subject:—"When I gang through the New Toon of Edinburgh, I seen this ane *writer*, and that ane *writer*—amais every house has a *writer*, leeving in't. Flent hae me but I think I'll hae to mak our Jock a *writer* too; no that I think the callant likely ever to make any thing by't, but just it may aiblins keep the lave aff him."

HINT TO EMIGRANTS.

An acquaintance of Bailie M'G—, of D—, made a grievous plaint to him one day of the hard times, and the impossibility of scraping together a livelihood in this wretched country. The bailie's own experience ran directly counter to these dolorous croakings, for his industry had realised a handsome competence; but he knew too much of the world to attempt proving to the complainer that ill success might be partly his own fault. He contented himself with remarking, that it was surely possible for a tradesman to draw together a tolerable business. "Not in this country," his friend repeated. "Weel, then," said the bailie, "what say ye to emigration? I have heard that some push their way geyan weel at Hobart Town or the Cape." "Yes," replied his desponding townsman, "that might be the case aince in a day; but if there is business there, there are mair folk now than can get a share o't." "Weel, it's maybe true ye say," rejoined the bailie, whose policy it was never to contradict any man directly; "but ye might gang farther—ye might gang up into the interior." "There's naething," said the inveterate grumbler, "there's naething there but kangaroos." The worthy magistrate was something nettled at this pertinacious hopelessness, and concluding that kangaroos were a tribe of native savages, among whom a careful pedlar might make pretty good bargains, he replied hastily, "Weel aweel, and isna a kangaroo's siller as good as another man's?"—*Chambers's Scottish Jests*.

BIOGRAPHIC SKETCHES.

JOHN SOBIESKI.

THE life of John Sobieski, the intrepid Polish patriot, is one of the most interesting which can be offered within the scope of royal biography, and cannot fail to be of universal acceptance. Joining all the spirit of ancient chivalry with Christian piety, and an extraordinary desire to secure the independence of his country, he finds few parallels in history, and can perhaps be compared only to our own Scottish hero Sir William Wallace, though far surpassing him in the magnitude of his warlike operations, and their effects on the condition of Europe. While exciting our admiration of his conduct, he is equally entitled to our grateful reverence, for he was the saviour of Christendom; and but for his exertions, that might not have been a vain threat which destined the altar of St Peter's to become the manger of the Moslem's horse.

John Sobieski was descended from an illustrious Polish family, and was born in the summer of 1629. The education of the future hero, like that of his elder brother Mark, corresponded to his high fortunes. In his father's princely inheritance of Zalkiew, he was taught not only the theory of war, but languages, history, politics, philosophy—every thing, in fact, likely to be useful to one whom his birth and connections destined to the first offices in the state. His ready genius required little aid from instructors, and his active frame was rendered hardy by martial exercises. Whether listening to the counsels of a father, whom a cultivated understanding and great experience in the world rendered the best of teachers, or bearding the wild boar in the recesses of his patrimonial forests, he afforded sure presages of his future eminence. But the most agreeable of his occupations was in an-

ticipating the vengeance which he vowed one day to take on the Osmanlis, or Turks, the continual enemies of his country, his religion, and his race.

Our young hero had scarcely attained his sixteenth year, when he and Mark were sent on their travels. In France he became the friend no less than the pupil of the great Condé; in Italy he applied himself to the fine arts, to public law, and to the policy of princes; at Constantinople he leisurely surveyed the proportions of the formidable antagonist against which, both as a Christian and a noble Pole, he had been taught to nourish unextinguishable hatred. He was preparing to pass among the Tartars, when an alarming insurrection of the serfs, and an invasion of Tartars, summoned him to the defence of his country. In no country in Europe was the slavery of the lower classes so utterly galling and abject as in Poland. But human endurance has its limits. The dreadful tyranny to which the serfs were subjected led them at length to break out into the present rebellion. An aged Cossack chief had his property seized by a Polish intendant; he was himself bound in fetters, and his wife and family murdered. His soul being on fire with these injuries, on his release he loudly proclaimed his wrongs; and 300,000 of his countrymen and of the Tartars whose Khan had espoused his cause, rose to avenge them. At the head of this imposing force he cut in pieces the armies sent against him by the diet. As he advanced into Polish Russia, he was joined by the serfs who had previously massacred their lords, and by some thousands of Arian and Calvinistic nobles, whom the intolerance of the diet or state council had doomed to death. In this manner rolled on the frightful inundation, when the two intrepid Sobieskis hastened from the Ottoman capital to oppose the confederated forces. Having supported the election of John Cassimir to the throne of the republic, John Sobieski eagerly commenced his military career. In the outset he had a subordinate rank, but his valour soon raised him to distinction. In the first campaign his brother Mark was slain. The insurrection was finally quelled; but new foes arose—on the one side the Swedish Charles Gustavus, on the other the Muscovite Czar Alexis, ravaged the country with impunity. The Polish armies were annihilated—John Cassimir was driven from his throne—and for a time the nation ceased to exist. But some true hearts there were, and among those none was truer or braver than Sobieski's, who never despaired of the country. Noble and peasant at length combined, and Cassimir was restored. During these contentions, which continued many years, Sobieski was gradually rising to higher commands. His successes over the Muscovite general, Sheremstov, and above all the brilliant victory he gained over the same enemy at Slobadysa, where 70,000 of the Czar's forces were killed or taken, drew on him the attention of Europe, and elevated him to a rank with the greatest captains of the age. His exploits during the six following years against the Muscovites and Tartars procured him, from his grateful sovereign, first the elevated post of Grand Marshal, next that of Grand Hetman of the crown. In the former capacity, he presided over the administration, and was the only man in the realm, who, by virtue of his office, could inflict the punishment of death without appeal. In the latter capacity he was invested with the supreme disposal of the military force.

The joy of the Poles was great to see their favourite captain thus placed at the head of all the civil and military dignities of Poland. The confidence they expected in his abilities was soon put to a severe trial. In 1667, 100,000 Cossacks and Tartars invaded the kingdom, and to meet these formidable numbers, there were only 10,000 ill-equipped soldiers; "but," said an officer of state, "if we have no troops, we have Sobieski, who is an army himself; if the public treasury be empty, his own revenues supply what is wanting; he burdens his patrimony with debts, that he may support the men he has raised." This was literally true. At his own expense the patriotic Hetman raised an army of 20,000, and fearlessly marched to meet the enemy. Having entrenched himself at Podhaic, he sustained, during sixteen successive days, with unshaken intrepidity, the impetuous onset of the assailants, on whom he inflicted a heavy loss. He did more: on the morning of the seventeenth, with his greatly diminished band, he issued from his fortifications, audaciously assumed the offensive, and in a few hours utterly routed Cossack and Tartar, with the Sultan Galga at their head, and compelled them to sue for peace. Success so splendid had been expected by no man, and all Poland flocked to the churches to thank God for having given her such a hero in the time of her need.

In the succeeding reign of Michael, the services of Sobieski were fully as important. In 1671, he opened a campaign with a handful of followers, and triumphed over Cossack, Tartar, and Turk. But he derived little satisfaction from his splendid successes. The king, terrified even in victory, consented not only to the dismemberment of the kingdom, but to the humiliation of an annual tribute as the price of peace. At the conclusion of this ignominious peace, the nation was torn by factions, and the Hetman retired to his estates in disgust. He was again called forth in order to defend his character from the vilest aspersions, which he did most effectually, and accomplished at the same time the rupture of the disgraceful treaty. This event once more brought Sobieski into the field. His

exploits were now fully more astonishing than they were before. He captured the strongest holds of the Turks, and drove them beyond the Danube; and Europe thanked God for "the most signal successes which, for three centuries, Christendom had gained over the Infidel." At the close of the campaign, Michael, who was an imbecile monarch, fortunately died. This latter event immediately induced a meeting of the Polish diet, in which every landholder in the country considered himself entitled to assist. On the 20th of April 1674, the diet opened, all the chivalry of Poland being ranged under their respective palatinates. Various foreign candidates were on this occasion proposed, and each, in his turn, rejected. At length the president of the assembly spoke—"Let a Pole reign over Poland;" a sentiment which was hailed with approbation by the crowd. "We have," he continued, "a man among us who has ten times saved the republic by his head and his arm; who is hailed, both by the whole world and by ourselves, as the first and greatest of the Poles. By placing him at our head, we shall best consecrate his own glory; happy shall we be in being able to honour, by an additional title, the remaining days of one who has devoted every day to the interests of the republic; happier still in securing our own safety, by rescuing genius and patriotism from the shackles cast over them, and investing both with new energy and power. We know that such a king will maintain our nation in the rank it occupies, because he has hitherto maintained it in its present elevation—an elevation to which he himself has raised it. Poles!" concluded the animated speaker, "if we here deliberate in peace on the election of a king; if the most illustrious potentates solicit our suffrages; if our power be increased, and our liberties left to us—where is the glory? Call to mind the wonders of Slobadysa, Podhaic, Kaluz, Kotzin—imperishable names!—and choose for your monarch JOHN SOBIESKI!" The effect was electrical; all the Polish and Lithuanian palatinates shouted "Long live King John III!" The soldiery drew their swords, swearing to exterminate all who did not join the cry. Sobieski was hence proclaimed, and entered on his new and royal functions with the approbation of all.

John Sobieski was thus raised for his talents and services to the highest office at which any human being can arrive. He was now the king of Poland; but we shall immediately see whether his apparently enviable honours brought with them peace and satisfaction. The new king was almost immediately called on to justify the confidence reposed in him by a gallant nation. While obtaining his accustomed successes over the Tartars, he was suddenly assailed by Mahomet at the head of an amazing, and a disciplined force. He had but 8000 men left, and the arrival of supplies was of all things the most contingent. He threw himself into Lemberg, where he was speedily invested. All Poland believed him lost; yet he sent for his queen and children, resolved, that, if conquered, their lives and his should there find a tomb. Taking advantage of a heavy fall of snow, which a high wind blew in the face of the foe, he one day issued from the fortress, led on his heroic band, shouting his favourite and pious war-cry of *Christ for ever!* and, after a sharp conflict, again routed the infidels, who fled with precipitation before this second *Cœur de Lion*. Well might all Christendom cry *A miracle!* for such wonders had never been wrought since the heroic days of Cressy and Poitiers. It was hoped that such disastrous defeats would deter the Moslems from opposing a captain who appeared as if raised up by Providence to be their scourge, if not their destruction; but this time their pride was exasperated; they levied another and more formidable army (three hundred thousand strong), which they confided to the Pacha of Damascus, the most resolute and ferocious of their generals. The Polish king's forces might reach ten thousand, yet, fearful as were the odds, he scorned to retreat. Having entrenched himself between two small villages on the banks of the Dneister, he supported, during twenty successive days, the most desperate efforts of the enemy, whose formidable artillery showered continued destruction into his camp. Never before had his situation been so critical. The bombardment was terrific, and was not remitted day or night; the ranks of the Poles were thinned by it, no less than by the frequent sallies which the king led to the very centre of the dense ranks of the Moslem. The Pacha was utterly confounded at such supernatural resistance; it gave way to admiration of the great hero; he proposed terms of peace, but they were rejected with scorn. After a pause, the bombardment recommenced; and as the balls and shells fell thick among this heroic band, Sobieski ordered them to be returned by his own guns and mortars. The alacrity of the soldiers in gathering up every ball and shell as they fell, in thrusting them into the ever-active engines, and dashing them into the faces of those who had sent them, would have roused the patriotism of the most insensible, and inspired even cowards with bravery. The Turks were thunderstruck at seeing so brisk a fire all at once resumed; they doubted not that the Tartars, their allies, who occupied the left bank of the Dneister, had suffered supplies to be poured into the camp. Forty-eight hours of inaction followed. On the morning of October 14, 1676, the astonishment of the Moslems knew no bounds when they saw the Pole calmly issue from his entrenchments, with his few followers drawn up for

battle, apparently as confident of the result as if legions had encompassed him. They could not believe a mere man would attempt such a thing: from that moment their superstition invested him with supernatural powers. The Tartars exclaimed that there was no use in contending with "the wizard king." The Pacha would not engage, and offered an honourable peace, which was immediately accepted.

In these extraordinary efforts, Sobieski received no support from the European powers, although he promised, if succoured, to drive the Mussulmans of Turkey back into those solitudes which vomited them forth. During the short peace which followed his last campaign, his life was embittered by the political intrigues of his wife, a Frenchwoman. This inquietude was, however, soon exhilarated by a new and still more tremendous war with the Turks, who now broke in upon Hungary in irresistible force, threatening the subjugation of Austria, and terrifying the adjacent principalities. All eyes were again directed to Sobieski. Rome trembled, and the Pope continually dispatched couriers to implore his interference in saving the church from the Moslem yoke. With the subsidies which he received from Rome, our hero was enabled to raise an army of 16,000 men. Soon he was joined by the Austrian forces, and his exultation was extreme to find himself at the head of 70,000 troops, having never before commanded half so many; with these he thought himself a match not only for 300,000 Turks and Tartars, but for the whole infidel world. The celebrated campaign of Vienna was now opened, but need not be related here. On the morning of September 11, 1683, the allied army reached the summit of a chain of mountains, from which the Austrian capital and the wide-spread gilded tents of the Moslems formed a magnificent prospect. Great was the astonishment of Kara Mustapha, the Turkish commander, to behold heights which he had confidently deemed inaccessible glittering with Polish lances. He did not then know that "the wizard king" was there, but the unwelcome intelligence was soon conveyed to him.

Next day, having heard mass and communicated—a pious practice which he never neglected when any great struggle was impending—the king descended the mountain to encounter the dense hosts of the Moslems in the plains below. The shouts of the Christian army bore to the infidels the dreaded name of *Sobieski!* The latter were driven from their entrenchments after some time. On contemplating these works, he deemed them too strong and too formidably defended to be forced. Five o'clock P. M. had sounded, and he had given up for the day all hope of the grand struggle, when the provoking composure of Mustapha, whom he espied in a splendid tent tranquilly taking coffee with his two sons, roused him to such a pitch that he instantly gave orders for a general assault. It was made simultaneously on the wings and centre. He himself made towards the Pacha's tent, bearing down all opposition, and repeating with a loud voice, *Non nobis, non nobis, Domine exercituum, sed nomini tuo, da gloriam!* (Not unto us, not unto us, but to thy name, Lord of Hosts, be ascribed the glory.) He was soon recognised by Tartar and Cossack, who had so often beheld him blazing in the van of the Polish chivalry; they drew back, while his name rapidly passed from one extremity to the other of the Ottoman lines, to the dismay of those who had refused to believe him present. At that moment the hussars, raising their national cry, "*God for Poland!*" cleared a ditch which would long have arrested the infantry, and dashed into the deep ranks of the enemy. They were a gallant band: their appearance almost justified the saying of one of their kings, "That if the sky itself were to fall, they should bear it up on the points of their lances!" The shock was rude, and for some minutes dreadful; but the valour of the Poles, still more the reputation of the leader, and more than all, the finger of God, routed these immense hosts; they gave way on every side; the Khan of the Tartars was borne along with the stream to the tent of the now despairing vizier. "Canst not thou help me?" said Mustapha to the brave Tartar; "then I am lost indeed!" "The Polish king is there!" replied the other; "I know him well! Did I not tell thee that all we had to do was to get away as quick as possible?" Still the vizier attempted to make a stand; in vain—as well might he have essayed to stem the ocean tide. With tears in his eyes he embraced his sons, and followed the universal example—of flight. It would be impossible to describe the transports of the Christian world when the result of the campaign was known. Protestants as well as Roman Catholics caught the enthusiasm; every pulpit in Italy, Spain, and England, resounded with the praises of the illustrious victor. The Pope was overwhelmed with joy, and bathed in tears of gratitude, remained for hours prostrate before a crucifix. Reader, this successful battle of Sobieski saved a large portion of Europe from the bloody and iron yoke of the Mahomedans. This was their last attempt on Europe, and from thenceforward they acted only on the defensive.

Amidst the rejoicings of Christendom, Sobieski was unhappy. He was beset by factions in the kingdom, who rendered his reign and his life miserable. True to its character, Poland continued divided against itself. There was no unanimity in its councils, and all its successes only engendered new causes of discontent. Finding himself unable to control the Polish nobles, and distracted by the intrigues of his wife, Sobieski resolved on abandoning the load of royalty with which

he had been invested. On his resolution being made known, the voice of faction was hushed, and even his enemies prayed him to continue their sovereign and protector. After a short struggle between his inclination and sober judgment, he submitted to the unanimous voice of the people. He therefore continued king, but it was only in name. Sick of the court, he fled into the forests, or wandered from one castle to another, or pitched his tent wherever a beautiful valley, picturesque landscape, the mountain torrent, or any natural object, attracted his attention. Sick, too, of the world, he sought for consolation in religion and philosophy. With his intimate friends he discoursed on the nature of the soul, the justice of heaven, and the wonders of another life more mysterious than even this. At length the end of this great man approached. A dose of mercury—or, as is conjectured, poison—which he had been recommended to take, was too strong for his constitution, and speedily released him from all his sufferings. John Sobieski, or John III., who thus died in the year 1696, was the last independent prince of the country; and with him ended Polish greatness.*

EMIGRATION.—NEW BRUNSWICK.

As little is comparatively known of the state of this Transatlantic colony, I beg to lay before my readers the following judicious observations elicited on the subject. It may be premised that a Company is established at Liverpool, under very favourable auspices, for the purpose of purchasing lands in New Brunswick, and promoting emigration to that settlement.

"Richard John Uniacke, Esq., is Attorney-General of Nova Scotia; read with great attention the evidence given before the committee, with respect to the emigration to Canada; is of opinion that emigration could with greater advantage be carried on to Nova Scotia and New Brunswick. One reason is, the passage is shorter, and can be accomplished at less expense—the other reason is, that the provisioning and providing for the settlers in that country would be at much less expense, at least one-third less; brought out emigrants, settled them, and is acquainted with the expense; is certain that the provinces of Nova Scotia and New Brunswick would provide for a population of four or five millions. The population of each may be now estimated at about one hundred thousand. There is a new settlement going forward, which Lord Dalhousie put under his management, and for that purpose allotted him a tract of country; called it Irish Town, and settled some people sent to him from Cork and Waterford, upon it. The first five families had not five shillings amongst them; those families are now increased to 25 families, in the course of five years, for the people who come out write to their families at home to say how comfortable they are, and those at home raise heaven and earth to try and come out to them; every year brings out new additions to the colony; they have given me £80, which I am to apply in sending out their relations. The last time I visited the place I asked them how they were situated, and they said, 'Tell our masters at home that we would not exchange situations with them.' Thinks there is in the island of Cape Breton, which is in Nova Scotia, and in New Brunswick, more than four millions of acres of ungranted land, of good quality. The average produce of wheat in Nova Scotia and New Brunswick may be from 20 to 28 bushels of 63 pounds to the acre; had himself ample means to estimate the climate and soil of New Brunswick and other colonies, as capable of producing wheat in as large quantities to the acre as any part of the United States; means to say he raises as good wheat in Nova Scotia, with as little labour, and in as large quantities to the acre, as they do in any part of the United States. There is no uncertainty of climate. We have the finest grass and corn crops—it is true we are obliged to hand-feed our cattle longer than in England or Ireland; our summers are hotter; our winters not so cold, though our frosts are harder. It is not frost that makes cold. Is sufficiently acquainted with the provinces of New Brunswick and Nova Scotia, including the island of Cape Breton, to form an opinion of the coals. The island of Cape Breton alone would supply the consumption of half of Europe; in Nova Scotia there is an immense mass of coals, and in New Brunswick coals are discovered on the river St John.

The passage from Great Britain to New Brunswick is shorter than to Quebec; opportunities more frequent than to Nova Scotia, which ought in some degree to lessen the expense; on arriving, the business and activity that prevails in every part of the province will give the emigrant casual employment and support. New Brunswick offers a large quantity of vacant land, of a good description, and excellent situations. So universal is the water communication through this province, that lots may be easily laid out adjoining some stream, or to no great distance from it, which, besides supplying the want of roads, affords convenient seats for mills, and a supply of fish for the emigrant's support. The winter is here colder than in Nova Scotia, but the summer is warmer and less clouded with fog. Every thing the seller has to buy is cheaper, and every thing he has to sell, is dearer than in any of the colonies, owing to the ease with which he can pay for the manufactures of Great Britain by the timber trade, and which are imported in great abundance,

* The above sketch has been drawn up chiefly from an able article in the Foreign Quarterly Review for April 1831.

and sold at reasonable prices; and owing to the excess of consumption above the produce, arising from the people being engaged in the timber trade, corn and fruits of the earth are therefore dear.

Considerable sums are appointed every year by the Colonial Assembly for repairing and improving roads to the remote plantations. New Brunswick, with the Gulf of St Lawrence on the one side, and the Bay of Fundy on the other, possesses a valuable fishery on its own shores; its coasts are indented with numerous bays and harbours, and the country possesses innumerable smaller streams to such a degree, that there is not, it is said, a point in the province eight miles distant from a navigable stream. In fertility of soil, it yields to no part of America; the face of the country is level, and is covered with an almost inexhaustible forest of large timber trees; beneath are mines of coal, freestone, lime, and gypsum; and it may be added, that the ports in the Bay of Fundy are the only harbours north of New York that are never closed by ice. At present this province contains about 80,000 inhabitants, whose exports are at least £1,000,000 annually, and employ 150,000 tons shipping, and 17,500 seamen. New Brunswick is bounded almost on two-thirds of its circumference by the ocean—it invites the commerce of the world. The general face of the country may be described as composed of bold undulations, sometimes swelling into the height of mountains, and again subsiding to vale and low lands, principally covered by noble forests, *not so dense* as to be inaccessible. The banks of the larger rivers, for the most part, disclose a country of the latter description; so in many places they are enclosed by lofty and precipitous rocks, whilst the abundance of inferior streams produces frequent slips or spaces of what is termed *intervale*, which being overflowed during the wet seasons, become, at stated intervals, distinguished by extreme fertility. The borders of the rivers and the islets with which they abound, furnishing extensive tracts of pasture and flourishing crops of Indian and European corn, attest the general adaptation of the soil to the most profitable uses of agriculture.

The importance of the province of New Brunswick must be acknowledged by every man who will be at the trouble to place the map of the British North American provinces before him. It exceeds 27,000 square miles, and comprises nearly 18,000,000 acres; is situated between the parallels of 45° 5' and 48° 4' north latitude, and between 36° 47' and 67° 58' of west longitude.

In common with every portion of America, this province enjoys that grand advantage and distinguishing feature, water communication; not a section of it but is traversed and intersected by almost innumerable streams, whilst the greater rivers form accessible channels of intercourse from its heart to its extremities. The distance from Cork, Valencia, Kilrush, and Galway, to this province, is not more than about 2500 miles, the population of which is at present only between 70 and 80,000 souls; yet, in the year 1824 its imports in 1070 vessels, measuring 241,000 tons, and navigated by 11,400 seamen, were valued at £514,550; and the exports the same year, in 1265 vessels, measuring 274,173 tons, navigated by 12,234 seamen, and their cargoes, at £462,043,—no bad proof of the comfort and industry of so small a population, or of the capabilities of this valuable colony. The table of exports and imports adds the price of sixty new vessels built in the province, and valued at £1.10 per ton, the whole measuring 16,488 tons, making the whole exports £626,913.

Mr Joseph Bedell commenced clearing his farm at Richmond, in the parish of Woodstock, about four miles from the River Saint John, in May 1821. Without any other assistance than that of three sons (the eldest of whom is now but sixteen, the next twelve years of age, and the other still younger), he had cleared fifty acres of land, from which he raised last season two hundred and forty bushels of wheat, two hundred and fifty bushels of oats, fifty bushels of buck wheat, six hundred bushels of potatoes, one hundred and fifty bushels of turnips, and a small quantity of Indian corn. He has paid £1.10 since he went on the farm, is now clear of debt, and owns four cows, one pair of horses, eight head of young cattle, twelve sheep, and eight hundred acres of good land."

TOMB OF RACHAEL.

Carne, in his travels in Judea, thus describes the tomb of Rachael:—"The spot is as wild and solitary as can well be conceived; no palms or cypresses give their shelter from the blast: not a single tree spreads its shade where the ashes of the beautiful mother of Israel rest. Yet there is something in this sepulchre in the wilderness, that excites a deeper interest than more splendid or revered ones. The tombs of Zacharias and Absalom, in the valley of Jehoshaphat, or of the kings, in the plain of Jeremiah, the traveller looks at with careless indifference; beside that of Rachael, his fancy wanders "to the land of the people of the East," to the power of beauty that could so long make banishment sweet to the devoted companion of the wanderer, who deemed all troubles light for her sake.

A CURE FOR THE GOUT.

"Pray, Mr Abernethy, what is a cure for gout?" was the question of an indolent and luxurious citizen. "Live upon sixpence a-day, and earn it!" was the pithy answer.

COLUMN FOR YOUNG WOMEN.

FASHIONS.

CONTINUING the subject of the TOILET, it has to be observed, that "although the fickle goddess of fashion rarely approaches the realms of the truly beautiful, except immediately after having rioted in the regions of absurdity, yet in spite of her absurdities she is not only obeyed, but admired in all ages and in all climes. By the force of habit, and by an unconscious association in the mind, of a dress and its wearer, fashion, even to those who are somewhat fastidious, generally appears graceful. To please her, the fine lady of one country almost feeds herself into an apoplexy; and the would-be beauty of another starves herself into 'the sister to a shade.' The Chinese females cripple their feet, and the Europeans torture their waists into the narrowest possible compass. In one age she induces the fair sex to cover their faces with patches; and in the next, to blush, if necessity compel them to apply one; alternately to cashier, as it were, their natural tresses in favour of false locks set on wires, to make them stand at a distance from the head—to elevate their hair to an immoderate height—or to cultivate it into drooping ringlets over the ears.

General fashions should certainly be conformed to, when, as Goldsmith observes, they happen not to be repugnant to private beauty. They may often be so modified as to suit the persons of all, and occasionally be so managed as to seem to have been created expressly for the most advantageous display of many individual graces of form or delicacy of complexion. Should high fashions be patronised, short ladies must abstain from adopting them, because they are becoming only to the tall; and if narrow dresses obtain pre-eminence, the slender must not sacrifice that fullness in the attire, for which, to them, the most exquisite display of fashion can never be a sufficient compensation. The example of those who have long necks and low shoulders should never lead those of a different style of person to wear necklaces of great breadth, to raise the dress towards the ears, or, by a quantity of drapery or profusion of ornament, to produce an apparent union of the head-gear and the shoulders. Jewellery should never be used to cover any imperfections in the neck; it is in much better taste, for such a purpose, to wear a neat collar, reaching as high as the cheek. Those who happen to be faultless in this respect, look better, perhaps, with the neck altogether unadorned.

Whatever be the reigning mode, and however beautiful a fine head of hair may be generally esteemed, those who are short in stature, or small in features, should never indulge in a profuse display of their tresses, if they would, in the one case, avoid the appearance of a dwarfishness and unnatural size of the head, and, in the other, of making the face seem less than it actually is. Those who have round or broad faces should wear drooping clusters of curls; and although it be customary to part the hair in the centre, the division should be made on one side, if it grow low on the forehead and beautifully high on the temples; but if the hair be too distant from the eyebrows, it should be parted only in the middle, where it is generally lower than at the sides, whatever temptations fashion may offer to the contrary.

It is almost impossible to form a theory of the proper combination of colours applicable to dress: they are subject to a thousand contingencies, and we daily discover agreeable harmonies of tint where we least expected them, and excruciating discords produced by the juxtaposition of tones. The influence of some neighbouring tint, the position of the colours combined, their relative stations, and the materials adopted for each, frequently tend to produce these effects. The colour of a single rosette often destroys the general tone and appearance of the dress, and occasionally it may be managed with such skill as to blend the tints of two or more principal parts of the costume, which, without some such mediator, would render each other obnoxious to the eye of taste. It is quite certain that the same colour which imparts a liveliness and brilliancy when used for light embellishments, and in a small quantity, becomes vulgar, showy, and disagreeable, if adopted for the most extensive portion and leading tint of the attire; and, on the other hand, the delicate or neutral colours, which look well when displayed over a considerable surface, dwindle into insignificance if used in small detached portions for minor ornaments. Generally speaking, trimmings will bear a greater richness of colour than the principal material of dress, the breadth of which is apt entirely to subdue its decorations if they be not a little more powerful in tint. But it is a grave error to endow the minor parts of the costume with an undue superiority over the rest: it should never be forgotten that the trimming is intended to embellish the dress, rather than that the dress should sink into a mere field for the display of the trimming. In all cases, the short should not wear their trimmings so high as the tall.

The occurrence of glaring offences against good taste in the trimmings or fixed embellishments of any principal part of the attire, is rare, compared with those which are perpetrated in the minor articles of gloves, shoes, ribbons, &c. How often have we seen a dress, exquisite in all its parts, utterly ruined, by the wearer, as a finishing touch, drawing on a vulgar glove! Much mischief of a similar nature is frequently done by feathers, flowers, ribbons, shoes, and articles of jewel-

lery. It is not enough that a flower is pretty; it must harmonise with, or form a pleasing contrast to, the other parts of the costume. Coloured shoes or boots ought to be avoided as untasteful, and very inferior in appearance and respectability to those of a clear black hue. Gloves should be in the most delicate tints that can be procured. But these, and many other arrangements connected with the toilet, must be governed by taste, which is the grand requisite, combining the triple qualities of propriety, neatness, and elegance."—*Young Lady's Book*.

DOMESTIC DUTIES.

The refinements of fashion, the duties of the toilet, and what compose the elegant amusements of young women, should on no account, unless in very particular instances, impede their course of instruction in the more useful and lasting duties of domestic life. To preserve a house, however mean or however dignified, in the best possible order, to have a knowledge in the making up of female attire, and to be learned in the divers processes of cookery, are in general absolutely essential; that is to say, if young women have any ambition to be placed at the head of a domestic establishment suitable to their rank and prospects in life. The house being the appropriate kingdom of the wife, it is necessary that she should be thoroughly mistress of all its details, and in no instance be left at the mercy of strangers or servants, who, even if anxious to please, seldom possess an education which renders them competent to carry on a household in its different parts. By a close yet tempered supervision on the part of the mistress of the establishment, a corresponding degree of comfort, peace, and saving of expense, is produced, and by her laxity or carelessness, exactly the opposite results take place. Without proper discipline and firmness, all the cares of the young wife may be frustrated. I think it is Miss Edgeworth who says, in one of her excellent novels, that the greater proportion of the miseries of life proceed from taking things for granted. The good wife takes nothing for granted. She gives forth her orders distinctly, and, if requisite, sees them executed. Let those things be impressed on the minds of my fair young countrywomen. William Cobbett, who has written a good deal on the value of industry in household affairs, has well said that "the lover is blind, but the husband has eyes to see with. He soon discovers that there is something wanted besides dimples and cherry cheeks; and I would (says he) have fathers seriously reflect, and to be well assured, that the way to make their daughters to be long admired, beloved, and respected by their husbands, is to make them skilful, able, and active in the most necessary concerns of a family. Eating and drinking (continues he) come three times every day; the preparations for these, and all the ministry necessary to them, belong to the wife; and I hold it to be impossible, that, at the end of two years, a really ignorant slutish wife should possess any thing worthy of the name of love from her husband. A woman who understands all things above mentioned is really a skilful person; a person worthy of respect, and that will be treated as such."

"How great is the change (says a respectable female writer) which is effected in the situation of a woman by the few solemn words pronounced at the altar! She who the moment before was perhaps a careless member of one family, finds herself, as if by magic, at the head of another, and involved in duties of the highest importance. If she possess good sense, her earnest wish will be to act with propriety in her new sphere. The married and single state equally demand the exercise and improvement of the best qualities of the heart and the mind. Sincerity, discretion, a well-governed temper, forgetfulness of self, charitable allowance for the frailties of human nature, are all requisite in both conditions. But the single woman being in general responsible for her own conduct solely, is chiefly required to cultivate passive qualities. To fall easily into the domestic current of regulations and habits; to guard with care against those attacks of caprice and ill humour which disturb its course; to assist rather than to take the lead in all family arrangements, are among her duties; while the married woman, in whose hands are the happiness and welfare of others, is called upon to lead, to regulate, and command. She has to examine every point in the new situation into which she is transplanted; to cultivate in herself, and to encourage in her husband, rational and domestic tastes, which may prove sources of amusement in every stage of their lives, and particularly at the latter period, when other resources shall have lost their power to charm. She has to proportion, not, as in the single state, her own personal expenses merely, but the whole expenditure of her household, to the income which she is now to command; and in this part of her duty there is often exercise for self-denial as well as for judgment. The condition of her husband may require her to abandon not only habits of expense, but even those of generosity. It may demand from her a rigid adherence to economy neither easy nor pleasant, when contrary habits and tastes, under much more liberal circumstances, have been fixed and cultivated. Such alterations in habit may at first be regarded as sacrifices, but in the end they will meet their compensation.

No woman should place herself at the head of a family without feeling the importance of the character which she has to sustain. Her example alone may afford better instruction than either precepts or admo-

nition, both to her children and servants. By a 'daily beauty' in her life, she may present a model by which all around her will insensibly model themselves. 'Knowledge is power' only when it fits us for the station in which we find ourselves placed. Of all the social domestic and personal obligations of the young wife, her husband is the centre: when they are properly discharged, his welfare and happiness are certainly promoted; and his esteem, affection, and confidence, established on a permanent basis. In neglecting them, he is neglected, his respectability diminished, and his domestic peace and comfort destroyed. One who, selfishly regardless of family duties, leads a life of dissipation and amusement, whose heart and soul are in the world, and never at home, is worthless as a wife or mother. She neglects the chief and positive duties of life, without fulfilling those of a minor character with any good effect. At home her example is injurious, and if abroad she possess any influence, it is merely of a temporary nature, resting probably on no securer ground than that of fashion. In portraying the *beau-ideal* of a married woman, I should describe one not absorbed in any single part, but attentive to the whole of life's obligations—one who neglects nothing—who regulates and superintends her household concerns; attends to, watches over, and guides her children, and yet is ever ready to consider, in moderation, the demands upon her time, which the numerous and various claims of society may make. Such appears to me to be a right sketch of the character of the married woman.

The first year of a woman's married life is not always most free from vexations and troubles. She carries into one family the prejudices and habits of another, which sometimes prove so different as to cause the task of assimilating herself, in her new character, to those with whom she is henceforth to dwell, to be both painful and difficult. If she be solicitous to promote unanimity between her new connections and herself, she will perhaps examine how far she can yield up her own opinions, and render herself agreeable to her new relatives. Good temper in a wife is indeed indispensable to conjugal happiness. A man may possess every advantage which the world has to give, and may have talents that render him a valuable member of society; yet if his wife be contentious, fretful, or discontented, his sum of happiness is most incomplete. Every man, whether employed in the duties of public or of professional life, meets with numerous circumstances and disappointments which harass and distress him. For the painful effects of these, a happy home provides an instantaneous antidote. Every thing beyond its walls seems for a time forgotten, while the mind is relieved, and its powers renovated for future exertions in the world, by the healthy air of cheerfulness which he breathes in the domestic circle. How important then it is, that the wife, by her amiable conduct, should obtain that influence over her husband's mind which will prompt him to turn frequently from the world to her society, for happiness and refinement."—*Mrs Parkes on Domestic Duties.*

INFLUENCE OF STEAM NAVIGATION.

The establishment of steam-boats between England and Ireland has greatly contributed to the prosperity of both countries. How have steam-boats done this? They have greatly increased the trade of both countries. On the examination of Mr Williams, before a Committee of the House of Commons, he stated "that before steam-boats were established, there was little trade in the smaller articles of farming production, such as poultry and eggs. The first trading steam-boat from Liverpool to Dublin was set up in 1824; there are now forty such boats between England and Ireland. The sailing-vessels were from one week to two or three weeks on the passage; the voyage from Liverpool to Dublin is now performed in fourteen hours. Reckoning ten miles for an hour, Dublin and Liverpool are 140 miles apart; with the old vessels, taking twelve days as the average time of the voyage, they were separated as completely as they would be by a distance of 2880 miles. What is the consequence? Traders may now have from any of the manufacturing towns in England, within two or three days, even the smallest quantity of any description of goods;" and thus, "one of the effects has been to give a productive employment to the capital of persons in secondary lines of business, that formerly could not have been brought into action." Mr Williams adds, "I am a daily witness to the intercourse by means of the small traders themselves between England and Ireland. Those persons find their way into the interior of England, and purchase manufactured goods themselves. They are of course enabled to sell them upon much better terms in Ireland; and I anticipate that this will shortly lead to the creation of shops and other establishments in the interior of Ireland, for the sale of a great variety of articles which are not now to be had there." And how do the small dealers in English manufactured goods find purchasers in the rude districts of Ireland for our cloths and our hardware? Because the little farmers have sent us their butter and eggs and poultry, and have either taken our manufactures in exchange, or have taken back our money to purchase our manufactures, which is the same thing. Many millions of eggs, collected amongst the very poorest classes by the industry of women and children, are annually sent from Dublin to Liverpool. Mr Williams has known fifty tons, or eight hundred and

eighty thousand eggs, shipped in one day, as well as ten tons of poultry; and he says this is quite a new creation of property. It is a creation of property that has a direct tendency to act upon the condition of the poorer classes in Ireland; for the produce is laid out in providing clothes for the females and children of the families who engage in rearing poultry and collecting eggs. Thus the English manufacturer is bettered, for he has a new market for his manufactures, which he exchanges for cheap provisions; and the dealer in poultry and eggs has a new impulse to this branch of industry, because it enables him to give clothes to his wife and children. This exchange of benefits—this advancement in the condition of both parties—this creation of produce and of profitable labour—this increase in the number of labourers—could not have taken place without machinery. That machinery is the carriage which conveys the produce to the river, and the steam-boat which makes a port in another country much nearer, for practical purposes, than the market-town of a thinly peopled district. A new machinery is added; the steam-carriage running on the rail-road, which, in the case of the Liverpool and Manchester rail-road, as one of the witnesses truly says, "is like carrying Liverpool forty miles into the interior, and thus extending the circle to which the supply will be applicable." The last invention perfects all the inventions which have preceded it. The village and the city are brought close together in effect, and yet retain all the advantages of their local separation; the port and the manufactory are divided only by two hours' distance in time, while their distance in space affords room for all the various occupations which contribute to the perfection of either. The whole territory of Great Britain and Ireland is more compact, more closely united, more accessible, than was a single county two centuries ago.—*Working Man's Companion.*

FALLS OF TERMI.

The great object of attraction, the celebrated *Cascata della Marmosa*, is between four and five miles from Termini. For nearly three miles, the road ascends the valley of the Nar, clothed with copes of evergreen oak. At Parpigno, the road divides, the upper road leading to the top of the fall, and the lower one to the bottom. The upper road ascends very rapidly the slope of a limestone hill, and then, for about three quarters of a mile, lies over ground nearly level, and sounding hollow to the tread, bearing every where traces of the course of the water, and formed, indeed, from its concretions. The channel in which the water runs above the falls is fifty-one feet wide; the descent is one foot in twenty, and the rapidity of the current about seven miles an hour. The traveller is conducted to different points to look down this tremendous cascade; the best view is from a little summer-house, on a projecting point considerably below this brow, said to have been built for the accommodation of Napoleon. The lower part of the cataract is not visible at the point, but the river is seen rushing among rocks, and precipitating itself in a succession of falls over a perpendicular precipice, losing itself in thunder amid the foam and spray of the gulf below. The first fall takes place where the stream is yet confined among the rocks of the channel, which is there much broken, and may have an elevation of 40 or 50 feet. The second fall is a perpendicular descent of between 500 and 600 feet. It afterwards strikes against a rock, and rushes down repeated falls, so close as to form almost one continued sheet of foam for 240 feet more into the Nar, so that the whole descent is upwards of 800 feet. The view of the falls from below, is, however, far to be preferred. In any point of view, either from above or below, Lord Byron says it is worth all the cascades and torrents of Switzerland put together.—*Italy, by Josiah Conder.*

POPULAR ERRORS.

It is a favourite paradox of some, that the greatest dandies make the bravest soldiers, as many take pleasure in repeating that great men have usually had small persons. These opinions spring from that love of finding or making a wonder which is one of the most tenacious principles in human nature, and is the cause of half the error that exists in the world. The fact seems to be, that brave men have been in general neither dandies nor slovens, but simply neat and cleanly, though of course there are exceptions of both kinds. Great men, also, have been in general neither little nor big, though there have been many of both classes. Size has nothing to do with the matter; and the middle class has produced the greatest number of geniuses, simply because it is the most numerous; just as those who purchase ten tickets in a lottery have a greater chance of winning than those who possess only one.—*Monthly Mag.*

REV. EDWARD IRVING.

We conceive it not improbable that the consciousness of muscular power, that the admiration of his person by strangers, might first have inspired Mr Irving with an ambition to be something, intellectually speaking, and have given him confidence to attempt the greatest things. He has not failed for want of courage. The public as well as the fair are won by a show of gallantry. Mr Irving has shrunk from no opinion, however paradoxical. He has scrupled to avow no sentiment, however obnoxious; he has revived exploded prejudices; he has scouted prevailing fashions; he has turned religion and the Caledonian

Chapel topsy-turvy. He has held a playbook in one hand, and the Bible in the other, and quoted Shakespeare and Melancthon in the same breath. He has taken the thorns and briars of scholastic divinity, and garlanded them with the flowers of modern literature. His imposing figure and dignified manner enable him to hazard sentiments or assertions that would be fatal to others. His controversial daring is backed by his bodily prowess. Take a cubit from his stature, and his whole manner resolves itself into an impertinence. But with that addition he overcomes the town, browbeats their prejudices, and bullies them out of their senses. All the mad tricks which he has performed have been done on the strength of a remarkable fine person and manner, and through that he has succeeded, otherwise he would have perished miserably.—*Hazlitt.*

VITALITY OF INSECTS.

If the head of a mammiferous quadruped or of a bird is cut off, the consequences are of course fatal. But the most dreadful wounds that imagination can figure or cruelty inflict, have scarcely any destructive influence on the vital functions of many of the inferior creatures. Læwenhoeck had a mite which lived eleven weeks transfixed on a point for microscopical investigation. Vaillant caught a locust at the Cape of Good Hope, and after excavating the intestines, he filled the abdomen with cotton, and stuck a stout pin through the thorax, yet the feet and antennæ were in full play after the lapse of five months. In the beginning of November, Redi opened the skull of a land tortoise, and removed the entire brain. A fleshy integument was observed to form over the opening, and the animal lived for six months. Spallanzani cut the heart out of three newts (in Scotland, called *asks*), which immediately took to flight, leapt, swam, and executed their usual functions for forty-eight hours. A decapitated beetle will advance over a table, and recognise a precipice on approaching the edge. Redi cut off the head of a tortoise, which survived eighteen days. Colonel Pringle decapitated several libellulæ or dragon flies, one of which afterwards lived four months, and another for six; and, which seems rather odd, he could never keep alive those with their heads on above a few days.—*Encyc. Brit. new edit.*

EELS TRAVELLING OVERLAND.

The eel (says Mr Jesse, in his "Gleanings in Natural History") is evidently a link between the fish and the serpent; but, unlike the former, it can exist a long time out of water, which its nocturnal migrations prove, though probably a certain degree of moisture on the grass is necessary to enable it to do this. That they do wander from one place to another, is evident. I have been informed, upon the authority of a nobleman well known for his attachment to field sports, that if an eel is found on land, its head is invariably turned towards the sea, for which it is always observed to make in the most direct line possible. If this information is correct (and there seems no reason to doubt it), it shows that the eel, like the swallow, is possessed of strong migratory instinct. An annual migration of young eels takes place in the river Thames, in the month of May; and they have generally made their appearance at Kingston, in their way upwards, about the second week in that month. These young eels are about two inches in length, and they make their approach in one regular and undeviating column of about five inches in breadth, and as thick together as it is possible for them to be. As this overland procession of eels generally lasts two or three days, and as they appear to move at the rate of nearly two miles and a half an hour, some idea may be formed of their enormous number.

ANTS.

Very erroneous opinions are prevalent with regard to the food of ants, which have often been supposed to consume corn, and to do great injury to plants by devouring their roots or stems. The truth is, that they are chiefly carnivorous insects, preying indiscriminately on all the softer parts of animals, and especially the viscera of other insects. These, indeed, they will often attack when alive, and overpower by dint of numbers, either devouring their victim on the spot, or dragging it a prisoner into the interior of the nest. If, however, the game should be too bulky to be easily transported, they make a plentiful meal, and exert, like the bee, a power of disgorging a portion, and of imparting it to their companions at home; and it appears that they are even able to retain at pleasure the nutritious juices unchanged for a considerable time. The rapidity with which they consume, and in fact anatomise, the carcass of any small bird or quadruped that happens to fall in their way, is well known, and furnishes an easy method of obtaining natural skeletons of these animals, by placing their dead bodies in the vicinity of a populous ant-hill. In hot climates, where they multiply to an amazing extent, their voracity and boldness increase with their numbers. Bossman, in his description of Guinea, states that in one night they will devour a sheep, leaving it a fine skeleton, while a fowl is for them only the amusement of an hour. In these situations they will venture to attack even living animals of considerable size. Rats and mice often become their victims. Their power of destruction keeping pace with their increase of numbers, it is hardly possible to assign limits to either; and the united hosts of this diminutive insect have often become formidable to man himself.—*Encyc. Brit. new edit.*

AN ALLIGATOR HUNT.

I MUST give a short account of an alligator hunt, at a place called Nellivelly, near Trincomalee, got up for the admiral's express amusement, and performed by a corps of Malays in the British service, the first Ceylon regiment. Very early in the morning of the 22d of September, the party, which consisted of several ladies and a large proportion of red coats and blue coats, were summoned from their beds to set forth on this expedition. The day had scarcely begun to dawn when we all cantered up to the scene of action. The ground lay as flat as a marsh for many leagues; here and there the plain was spotted with small stagnant lakes, connected together by sluggish streams, or canals, scarcely moving over beds of mud, between banks fringed with a rank crop of dragged weeds, and giving birth to clouds of mosquitoes.

The chill atmosphere of the morning fell so thick and clammy, that it was impossible for the most confident in his own strength and health not to think of agues, jungle fevers, and all the hopeful family of malaria. The hardy native soldiers, who had occupied the ground during the night in despite of the miasmata, were drawn up to receive the admiral; and a very queer guard of honour they formed. The whole regiment had stripped off their uniforms, and every other stitch of clothing, save a pair of short trousers, and a kind of sandal. In place of a firelock, each man bore in his hand a slender pole about six feet in length, to the extremity of which was attached the bayonet of his musket. His only other weapon was the Malay crease, a sort of dagger, or small edition of the waving two-edged sword with which the angel Michael is armed in Raphael's picture of the Expulsion of our First Parents from Paradise.

Soon after the commander-in-chief came to the ground, the regiment was divided into two main parties, and a body of reserves. The principal columns, facing, one to the right, the other to the left, proceeded to occupy different points in one of those sluggish canals I have already mentioned, connecting the lakes, or pools, scattered over the plain. These detachments, being stationed about a mile from one another, enclosed an interval where, from some peculiar circumstances known only to the Malays (who are passionately fond of this sport), the alligators were sure to be found in great numbers. The troops formed themselves across the canal, in three parallel lines, ten or twelve feet apart; but the men in each line stood side by side, merely leaving room enough to wield their pikes. The canal may have been about four or five feet deep in the middle of the stream, if stream it may be called, which scarcely moved at all. The colour of the water, when undisturbed, was a shade between ink and coffee; but no sooner had the triple line of Malays set themselves in motion, and the mud got stirred up, than the consistence and colour of the fluid became like those of peas soup.

On every thing being reported ready, the soldiers planted their pikes before them in the mud, and, if I recollect right, each man crossing his neighbour's weapon; and at the word "march," away they all started in full cry, sending forth a shout or war-whoop sufficient to curdle the blood of those on land, whatever effect it may have had on the inhabitants of the deep. As the two divisions of the invading army, starting from opposite ends of the canal, gradually approached each other in pretty close column, screaming and yelling with all their souls, and striking their pikes deep in the slime before them, the startled animals naturally retired towards the unoccupied centre.

Generally speaking, the alligators had sense enough to turn their long tails upon their assailants, and to scuttle off as fast as they could towards the middle part of the canal. But every now and then, one of the terrified monsters, either confused by the sound or provoked by the prick of a pike, or mystified by the turbid nature of the stream, floundered backwards and, by retreating in the wrong direction, broke through the first, second, and even third line of pikes. This, which would have been any thing but amusement to unpractised hands, was the perfection of sport to the delighted Malays. A double circle of soldiers was speedily formed round the wretched aquatic who had presumed to pass the barrier. By means of well-directed thrusts with numberless bayonets, and the pressure of some dozens of feet, the poor brute was often fairly driven beneath his native mud. When once there, his enemies half-choked and half-spitted him, till at last they put an end to his miserable days in regions quite out of sight, and in a manner as inglorious as can well be conceived. The two bodies of troops, marching from opposite quarters, drew within a hundred yards of each other. The intermediate space was now pretty well crowded with alligators swimming about in the utmost terror; at times diving below, and anon showing their noses, well plastered with mud, high above the surface of the dirty stream; or occasionally making a furious bolt, in sheer despair, right at the phalanx of Malays. On these occasions half-a-dozen of the soldiers were often upset, and their pikes either broken or twisted out of their hands, to the infinite amusement of their companions, who speedily closed up the broken ranks, as if their comrades had been shot down in battle. The killed were none, but the wounded many; yet no man flinched in the least.

The perfection of the sport appeared to consist in detaching a single alligator from the rest, surround-

ing and attacking him separately, and spearing him till he was almost dead. The Malays then, by main strength, forked him aloft over their heads, on the end of a dozen pikes, and by a sudden jerk pitched the conquered monster far on the shore. As the alligators are amphibious, they kept to the water no longer than they found they had an advantage in that element; but as the period of the final *mêlée* approached, on the two columns of their enemy closing up, the monsters lost all discipline, floundered, and plouted up the weedy banks, scuttling away to the right and left, helter-skelter.

The concluding battle between these retreating and desperate alligators and the Malays of the reserve was formidable enough. Indeed, had not the one party been fresh, the other exhausted, one confident, the other broken in spirit, it is quite possible that the alligators might have worsted the pirates, as the Malays are called in every other part of the world but the east, where they are generally admitted to be as good a set of people as any of their neighbours. It is needless to say, that while all this was going on, our gallant admiral, Sir Samuel Hood, was a pretty busy spectator. His eagle eye glanced along the canal, and at a moment took in the whole purpose of the campaign. As the war advanced, and sundry affairs of outposts took place, we could see his face flushing with delight. But when the first alligator was cast headlong and gasping at his feet, pierced with at least twenty pike wounds, and bristled with half-a-dozen fragments of these weapons, fractured in the onslaught, the whole plain rung with his exclamation of boyish delight. When the detachments closed in upon their prey, and every moment gave birth to some new prodigy of valour, or laid a whole line of Malay soldiers prostrate on the muddy stream, like so many ninepins, I verily believe, that if none of his own people had been present, the admiral would have seized a pike himself, and jumped into the thickest of the fight, boots, sword, cocked hat, and all! As it was, he kept himself close to the banks, and rivalled the best Malay amongst them in yelling and cheering on the forces to their duty.

This intensity of eagerness had well nigh proved rather awkward for his excellency's dignity, if not his safety; for in spite of the repeated warnings of the English officers of the regiment, who knew from former hunts what was sure to happen eventually, the admiral persisted in approaching the edge of the canal as the final act of the alligators' tragedy commenced. And as we, his poor officers, were of course obliged to follow our chief into any danger, a considerable party of us found ourselves rather awkwardly placed between the reserves of Malays already spoken of and the canal, just as the grand rush took place at the close of the battle. If the infuriated crocodiles had only known what they were about, and had then brought their long sharp snouts, and still harder tails, into play, several of his majesty's officers might have chanced to have found themselves in a scrape. Some of our party were actually pushed over, and fell plump in the mud, to the very provoking and particular amusement of the delighted admiral, whose superior adroitness enabled him to avoid such an undignified catastrophe, by jumping first on one side and then on the other, in a manner which excited both the mirth and the alarm of his company. I forget the total number of alligators killed; but certainly there could not have been fewer than thirty or forty. The largest measured ten feet in length, and four feet in girth, the head being exactly two feet long.—*Captain Basil Hall.*

MATRIMONY.

[BY SAMUEL ROGERS.]

Then come those full confidings of the past,
All sunshine now where all was overcast.
Then do they wander till the day is gone,
Lost in each other; and, when night steals on,
Covering them round, how sweet her accents are!
Oh when she turns to speak, her voice is far,
Far above singing! But soon nothing stirs
To break the silence—Joy like his, like hers,
Deals not in words—and now the shadows close,
Now in the glimmering, dying light she grows
Less and less earthly! As departs the day,
All that was mortal seems to melt away,
Till like a gift resumed as soon as given,
She fades at last into a spirit from heaven.

Then are they blest indeed—and swift the hours
Till her young sisters wreath her hair in flowers,
Kindling her beauty—while, unseen, the least
Twitches her robe, then runs behind the rest,
Known by her laugh that will not be suppressed.
Then before all they stand—the holy vow
And ring of gold, no fond illusions now,
Bind her as his. Across the threshold led,
And every tear kissed off as soon as shed,
His house she enters, there to be a light
Shining within, when all without is night;
A guardian angel o'er his life presiding,
Doubling his pleasures, and his cares dividing!
How oft her eyes read his—her gentle mind
To all his wishes, all his thoughts inclined;
Still subject—ever on the watch to borrow
Mirth of his mirth, and sorrow of his sorrow.
The soul of music slumbers in the shell,
Till waked to rapture by the master's spell—
And feeling hearts—touch them but rightly—pour
A thousand melodies unheard before!

Nor many moons o'er hill and valley rise,
Ere to the gate with nymph-like step she flies.
And their first-born holds forth, their darling boy,
Who smiles how sweet, how full of love and joy,
To meet him coming—theirs through every year
Pure transports, such as each to each endear!
And laughing eyes and laughing voices fill
Their halls with gladness. She, when all are still,
Comes and undraws the curtain as they lie,
In sleep how beautiful!

SIR WALTER SCOTT.

At the sale of an antiquarian gentleman's effects in Roxburghshire, which Sir Walter Scott happened to attend, there was one little article, a Roman patena, which occasioned a good deal of competition, and was eventually knocked down to the distinguished Baronet at a high price. Sir Walter was excessively amused, during the time of the bidding, to observe how much it excited the astonishment of an old woman, who had evidently come there to buy culinary utensils on a more economical principle. "If the parritch pan," she at length burst out, "if the parritch pan gangs at that, what will the kail pat gang for!"

ELECTRICAL CLOCK.

The Journal of Geneva gives the following description of a curious clock, exhibited in that city, and executed by M. Bianchi of Verona. This machine, which is especially remarkable on account of its extreme simplicity, is composed only of a pendulum, a large wheel, two escapements, and a quadrature. Such are the visible parts. We must, however, suppose that a pinion and a wheel make the communication between the great wheel and the quadrature, though we cannot see them. The pendulum, at each vibration, causes one of the escapements to advance the great wheel one tooth, which, after this movement, has a pause making the dead round. As there is no metallic moving power to set the machine a-going, we find, on examining what keeps up the motion, that the pendulum, which is almost out of proportion with the clock, descends into a case, and there, at each vibration, the ball, or bob, which is furnished with a conductor, approaches alternately two poles, to which voltaic piles supply their portion of electricity; so that the pendulum, when once put in motion, retains it by means of the electricity alternately drawn from the two poles. This machine, which is equally simple and ingenious, is worthy of the attention of the artist. Perhaps other interesting results may be obtained by employing the electric fluid as a moving power, however slight the force such an agent may seem capable of communicating.—*Literary Gazette.*

CIVILISATION OF THE SOUTH SEA ISLANDERS.

It is a pleasing fact, which demonstrates unequivocally that the South Sea Islanders are not deficient in capacity, but are capable, when inducement sufficient is offered, of acquiring habits of close industry, that in the islands of Raiatea and Huahine, or any of the stations in the Leeward Islands, there is hardly an adult female, excepting the aged and infirm, who could not use her needle so as to make her own clothes and those required by other members of the family. The occupation furnished by the new order of things that has followed the introduction of Christianity, is one of the important sources of their present enjoyment. But this is not the only advantage resulting therefrom. It has opened a new channel for commercial enterprise, and has actually created a market for British manufactures, the consumption of which among the islands of the Pacific that have received the gospel, is already considerable.—*Ellis's Polynesian Researches.*

EXTENT OF THE BRITISH DOMINIONS.

The sun never sets on the dominions of our king. Before the evening ray leaves the spires of Quebec, his morning beams have shone for three hours on Port Jackson; and while sinking from the waters of Lake Superior, his eye opens upon the Ganges.—*Entertaining Press.*

KRIM GHERRI KATTI GHERRI.

Have any of our readers, in turning over the pages of the Edinburgh Almanac, ever been surprised in noticing, as an office-bearer in one of our pious beneficiary institutions, a person with the singular title of *Krim Gherri Katti Gherri*? If they have, they will most probably be glad to learn who this strange gentleman is. Mr Krim Gherri Katti Gherri happens to be sultan of the kingdom of Caucasus in Tartary; and, what is still more curious, his wife, the sultana, is an Edinburgh lady, the daughter of Colonel —. The history of young Krim may be soon told. While about fifteen years of age, he became acquainted with some missionaries who had taken up their station near the Caucasus; on which occasion he embraced the Christian religion, left his native country, and proceeded, under their protection, to St Petersburg, which he shortly after quitted for Scotland—and here he soon acquired the English language, habits, and manners. While resident in Edinburgh, he became acquainted with the above lady, to whom he was married, and carried her with him, though against the consent of her relations. As Krim is lineally descended from the ancient khans of the Crimea, the throne of the present sultan, Mahmoud, will be his on the extinction of the reigning family. He has sons; and should any of them hereafter ascend the Ottoman throne, the singular fact will be presented of a prince of a descendant from an Edinburgh family holding his court at Constantinople, and reigning over the Turkish empire.

EDINBURGH: Published, weekly, by W. and R. Chambers, 19, Waterloo Place; Orr & Smith, Paternoster-row, London; and George Young, Dublin.—Agent in Glasgow, John Macleod, 20, Argyle Street; and sold by all other Booksellers in Great Britain and Ireland.

Subscribers in town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half-year of twenty-four weeks, 2s.; and of a year, 6s. 6d. In every case payable in advance.

From the Steam-press of W. and R. Chambers.

PRICE THREE HALFPENCE.

THE DOWNDRAUGHT.

SIDE by side with *Victims*, whom we commemorated in a former Number, might be placed the kindred species *Downdraughts*, who are only different from the accident of their having friends who will rather be weighed down by them to the very earth, to the grave itself, than permit them to sink by themselves. The Downdraught is in reality a Victim, and one of the darkest shade, being generally a person totally worthless in character, and abandoned in habits; but then he has not altogether cut the cables which bound him to his native grade in society—he has not all forgot himself to stone—he is still domesticated with his friends—he has a mother, or a wife, or a brother, or a sister, or perhaps an old aunt, who will try to keep him in food and clean linen, and, having lost all hope of his ever being actively good, will do anything for him, if he will only preserve a neutrality, and not be positively evil. He is a victim in appearance (always excepting the clean shirt), but he enjoys the happy superiority over that class, of having an open door to fly to when he pleases, and either a kind relation, who considers him "only a little wild in the meantime," or else one who, for the sake of decent appearances, will endeavour to patch up all his peccadilloes, and even be tyrannised over by him, rather than shock society by an open rupture. The personal tendencies of a Downdraught to victimization are strong as the currents of the great deep, but he is withheld from it by others. He has always some anchorage or other upon decent life, to keep him back from the gulf to which he would otherwise hurry on. In many cases, the very kindness and indulgence of friends was the original cause of his becoming a Downdraught. He had every thing held to his head. He was encouraged in his pretences of headaches as an excuse for staying away from school. When afterwards an apprentice, he was permitted to break off, on the score of being compelled to put on fires and sweep out the shop. Or, perhaps, it was from nose of those causes. Possibly, he was just one of those persons who seem to be totally destitute of all perception of the terms upon which men are permitted to exist in this world; that is, that they are either to be so fortunate as to have "their fathers born before them," so that they may accede to wealth without exertion, or must else do something to induce their fellow-creatures to accord them the means of livelihood without beggary. That many persons are really born without this great leading faculty, is unfortunately but too indisputable; and, assuredly, they are as proper inmates for a lunatic asylum as more frantic madmen; for what is the use of reason, or even of talent, without the desire of exerting it, either in one's own behalf, or in behalf of mankind? The terms of existence we allude to are expressed in the text of Scripture, "By the sweat of thy brow thou shalt earn thy bread;" so that the man must be considered a kind of heretic, as well as a fool, who will not, or can not, understand them. Yet the fact is so, that many men arrive at maturity with either a sense of these conditions of life, more or less imperfect, or no sense of them at all. They perhaps conceive themselves to be born to keep down the pavement of Prince's Street with boots one inch and a half deep in the heel, or to fumigate the air of that elegant street with cigars at three shillings per dozen; but that is the utmost extent to which their notions of the purposes of life ever extend. These men, of course, are predestined Downdraughts. We see them already, with our mind's eye, exhausting the kindness and patience of a brother, or a wife, yea almost of a mother, with their idle and dissolute habits—dragging those relations slowly but surely down into misery and disgrace—and only in the meantime saved from being kicked out of doors, as they deserve, not by any regard for merits of their own, for they have none, but by the tenderness of those relations for their own reputation.

A decent citizen, of the name of Farney, retired about five-and-twenty years ago from active life, and, planting himself in a neat villa a little way beyond the southern suburbs of Edinburgh, resolved to do nothing all the rest of his life but enjoy the ten or

twelve thousand pounds which he had made by business. He was a placid, inoffensive old man, only somewhat easy in his disposition, and, therefore, too much under the control of his wife, who, unfortunately, was a person of a vulgarly ambitious character. The pair had but one child—a daughter, Eliza Farney,—the toast of all the apprentices in the South Bridge, and really an elegant, and not unaccomplished, young lady. The only object which Mr and Mrs Farney now had in life, besides that of enjoying all its comforts, was the disposal of this young lady in marriage. Whenever there is such a thing as ten thousand pounds connected with the name of a young lady, there is generally a great deal of more fuss made about it than when the sum is said to exist in any other shape or circumstances. It is important in the eyes of all the young men who think themselves within shot of it. It is important in the eyes of all the young women who have to lament that they do not possess similar advantages. It is important in the eyes of all the fathers and mothers of sons who think themselves within range of it. And, lastly, it is important, immensely important indeed, in the eyes of parties, young lady, mother, and father, sister or brother, who have any thing to say in the disposal of it. Money in this shape, one would almost think, is of a different value from money in any other: the exchange it bears against cash in business, or cash in the prospect of him who knows he can win it, is prodigious. At the very lowest computation, a thousand pounds in the purse of a young lady is worth ten thousand in the stock of a man of trade. Nay, it is astonishing what airs we have known a few hundred pounds of this kind put on in respect, or rather disrespect, of decent people, who were almost winning as much in the year. In fact, the fiddle-faddle about the disposal of an heiress is a great farce, and never fails to put either the parties concerned in the disposal, or else the candidates for the acquisition, into a thousand shabby and selfish attitudes. It is hard to say if the young lady herself is the better for it all. The only certain effect of her possessing a fortune, is, that it deprives her of ever having the pleasing assurance, given to most other women, that she is married for her own sake alone. Sincere love is apt to retire from such a competition, through the pure force of modesty, its natural accompaniment; and the man most apt to be successful is he who, looking upon the affair as only a mercantile adventure, pursues it as such, and only hopes to be able to fall in love after marriage.

It happened that Eliza Farney was loved, truly and tenderly loved, by a young man of the name of Russell, whose parents had been acquainted with the Farneys in their earlier and less prosperous days, but were now left a little behind them. Young Russell had been the playmate of Eliza in their days of childhood; he had read books with her, and taught her to draw, in their riper youth; and all the neighbours said, that, but for the brilliant prospects of Miss Farney, she could not have found a more eligible match. Russell, however, was still but the son of a poor man. He was himself struggling in the commencement of a business, which he had begun with slender means, in order to sustain the declining fortunes of his parents. His walk in life was much beneath the scope of his abilities, much beneath his moral deserts; but, under a strong impulse of duty, he had narrowed his mind to the path allotted to him, instead of attempting to do justice to his talents by entering upon any higher and more perilous pursuit. Thus, as often happens, an intellect and character, which might have brightened the highest destinies, were doomed to a sphere all unmeet for them, where they were in a manner worse than lost, as they only led to a suspicion which was apt to be unfavourable to the prospects of their possessor, namely, that he was likely to be led, by his superior tastes, into pursuits to which his fortune was inadequate, or into habits which would shipwreck it altogether. Russell looked upon Eliza Farney, and despaired. He saw her, as she advanced into womanhood, recede gradually from his sphere in society, and enter into one more suitable to her father's improving fortunes, into which it was not

for him to intrude. Eliza had, perhaps, entertained at one time a girlish fondness for him; but it was not of so strong a character as to resist the ambitious maxims of her mother, and the sense of her own importance and prospects, which began to act upon her in her riper years.

"Amongst the rest young Edwin sighed,

But never talked of love."

Some appearance of coldness, which he saw, or fancied he saw, in her conduct towards him, caused his proud and pure nature to shrink back from the vulgar competition which he saw going forward for the hand of "the heiress." It was not that the fondest wishes of his heart were met with disappointment—perhaps he could have endured that—but he writhed under the reflection, that external circumstances should separate hearts that once were allied, and that no conscious purity of feeling, no hope of hereafter distinguishing himself by his abilities, was of avail against the selfish and worldly philosophy which dictated his rejection. It was only left for him to retire into the chambers of his own thoughts, and there form such solemn resolutions for improving his circumstances and distinguishing his character, as might hereafter, perhaps, enable him to prove to the cold being who now despised him, how worthy, how more than worthy, perhaps, he was of having enjoyed her affections, even upon the mean calculations by which he was now measured and found wanting.

The mother, to whom this rupture was chiefly owing, now applied herself heartily to the grand task of getting her daughter "properly disposed of." Every month or so, her house was turned topsy-turvy, for the purpose of showing off the young lady in gay assemblies. Care was taken that no one should be invited to these assemblies who was merely of their own rank. Unless some capture could be made in a loftier, or what appeared a loftier circle, it was all as nothing. The human race hang all in a concatenation at each other's skirts, those before kicking with all their might to drive off those behind them, at the same time that they are struggling might and main, despite of corresponding kicks, to hold fast, and pull themselves up by means of their own predecessors. This is particularly the case where a mother has a daughter to dispose of with the reversion of a few thousands. Money under these circumstances, as already explained, would be absolutely thrown away if given only to a person who estimated it at its ordinary value; it must be given to one who will appreciate it as it ought to be, and sell pounds of free will and honourable manhood for shillings of the vile dross. At length at a ball held in the Archers' Hall—a kind of Almack's in the east—the very man was met with—a genteel young spark, said to be the grand-nephew to a Baronet in the north, and who was hand in glove with the Greigsons, a family of *quis quis* gentility in the New Town, but who loomed very large in the eyes of a person dwelling in the south side. This fellow, a mere loose adventurer, whose highest destiny seemed to be to carry a pair of colours if he could get them, and who positively had no claims upon consideration whatsoever, except that he kept a decent suit of clothes upon his back, and was on terms of intimacy with a family supposed to belong to the *haut ton*—this poor unannealed wretch, recommended by impudence and a moustache, which he amiably swore he would take off when married, gained the prize from which the modest merit of Russell was repelled. In a perfect fluster of delight with the attention he paid to her daughter, terrified lest he should change his mind, or any unforeseen event prevent the consummation so devoutly to be wished, the managing mother presented no obstruction to the courtship. "Such a genteel young man!" she would say to her husband. "He is greatly taken out in good company. Just the night before last, he was at the Honourable Mrs —'s party in Oman's Rooms. He dined with Miss Foster, the great heiress, who, they say, is distractedly in love with him. But she says she has naething like the elegant carriage o' our 'Liza. Indeed, between you and me, says he, jokingly, to me the other day, she's splay-footed. He could make his fortune at

once, you see, however, and I'm sure its really extraordinary of him to particularee the like o' us in the way he's doing"—and so forth. The old man sat twirling his thumbs and saying nothing, but having his own fears all the time that all was not really gold that glittered. He was, however, one of those people who, upon habit and principle, never say a single word about any speculative thing that is proposed to them, till the result has been decided, and then they can tell that they all along thought it would turn out so. It was untelling the prescience and wisdom that old Farney believed himself to be thus possessed of. Suffice it to say, the managing mother, within the month, made out a mittimus of destruction in favour of her daughter, Eliza Farney, spinster, consigning her to the custody of William Dempster, Esq., black-guard by commission, and Downdraught by destiny.

The fortune of Miss Farney was not exactly of the kind that suited Mr Dempster's views. It was only payable after the death of her father. Mr Dempster, therefore, saw it to be necessary to take expedients for obtaining the use of it by anticipation. He commenced a large concern in some mercantile line, obtaining money in advance from the old gentleman in order to set the establishment on foot. He also procured his signature to innumerable bills, to enable him to carry it on. The business in reality was a mere mask for obtaining the means of supporting his own depraved tastes and appetites. There was hardly any kind of extravagance, any kind of vice, which he did not indulge in at the expense of old Farney. The result was what might be expected from such premises. Exactly a twelvemonth after the marriage, Dempster stopped payment, and absconded without so much as even taking leave of his wife. His folly and profligacy together had already absorbed the whole fortune with which Mr Farney had retired from business, besides a good deal more for which the unfortunate old man was security. He was in consequence totally ruined, left destitute in old age, without the least resource; while the young elegant female, who, a short year before, was the admiration and envy of glittering circles, had just become a mother, upon the bed which only waited for her convalescence to be sold for behoof of her husband's creditors.

Farney found refuge—and considered himself most fortunate in finding it—in a beneficiary institution for decayed citizens of which he had himself, in better days, been one of the managers, but which he did not live long to enjoy. His wife, about the same time, died of one of those numberless and varied diseases which can only be traced to what is called a broken heart. The daughter—the unhappy, and, in a great measure, guiltless victim of her wretched ambition—had no eventual resource, for the support of herself and her infant, but to open a small school, in which she taught female children the elements of reading, writing, and sewing. The striking infelicity of her fate, joined to her own well-known taste and industrious habits, in time obtained for her considerable patronage in this humble occupation; and she would eventually have been restored to something like comfort, but for the unhallowed wretch whose fate had become identified with her own. Where this fellow went, or how he subsisted, for the three years during which he was absent, no one ever knew. He was heard to talk of the smugglers in the Isle of Man, and of the United Irishmen of the sister isle; but it can only be surmised that he joined these respectable corps. One day, as Mrs Dempster sat in the midst of her little flock of pupils, the door was opened, and in crawled her prodigal husband, emaciated, travel-worn, and beggar-like, with a large black spot upon one of his cheeks, the result of some unimaginably low and scoundrelly brawl. The moment she recognised him, she fainted in her chair; the children dispersed and fled from the house, like a flock of chickens at sight of the impending hawk; and when the unfortunate woman recovered, she found herself alone with this transcendent wretch, the breaker of the peace of her family, the murderer of her mother. He accosted her in the coolest manner possible, said he was glad to see her so comfortably situated, and expressed an anxiety for food and liquor. She went with tottering steps to purvey what he wanted; and while she was busied in her little kitchen, he sat down by her parlour fire and commenced smoking from a nasty black pipe, after the manner of the lowest mendicants. When food and drink were set before him, he partook of both with voracious appetite. Mrs Dempster sat looking on in despair, for she saw that the presence of this being must entirely blight the pleasant scene which her industry had created around her. She afterwards said, however, that she could have perhaps overlooked all, and even again loved this deplorable wretch, if he had inquired for his child, or expressed a desire to see him. He did neither—he seemed altogether bent on satisfying his own gross appetites. After spending a few hours in sulky unintermitted smoking and drinking, he was conveyed to a pallet in the garret, there to sleep off his debauch.

It were needless to go through all the distressing details of what ensued. Dempster henceforth became a Downdraught on his wife. This forlorn woman often confessed to her friends that she was perfectly willing to support her husband, provided he would be but content with the plain fare she could offer him, and just walk about and do nothing. But

he was not of a temper to endure this listlessness. He required excitement. Instead of quietly spending his forenoons in the arbour, called the *Cage*, in the Meadows, among decayed military pensioners, and other harmless old men, he prowled about the crowded, mean thoroughfares, drinking where he could get liquor for nothing, and roistering in companies of the most debased description. He incurred debts in all directions on the strength of his wife's character, and she was necessarily compelled to liquidate them. The struggles which she at this time made were very great. Like the mother of Gray the Poet, she endured all kinds of ill usage, and persevered under every difficulty to give her son a respectable education, in order that he might have an opportunity of wiping away the stains of his father's vices, and be a comfort to his mother in the decline of life. To do this, and at the same time continue paying the vile debts of her profligate husband, was altogether impossible. She exhausted the beneficence, and even tired the pity of her friends. It need hardly be mentioned, that the creditors of a husband have an undeniable claim upon the effects of his wife. It unfortunately happened that the wretches with whom Dempster contracted his debts were as worthless as himself. After draining every resource which his wife could command, he summed up his villany by giving a promissory note for fifteen pounds to one of his lowest associates. It is supposed that he struck the bargain for a couple of guineas, for with this sum he again absconded from Edinburgh, and, taking his way to Greenock, shipped himself on board of a vessel for America. At first his wife was thankful for the relief; she again breathed freely; but her joy was soon turned into mourning. The promissory note made its appearance; she had just scraped up and paid her rent; she had not therefore a farthing in the world. In a fortnight the whole of her effects were sold upon distraint. She was turned to the street a second time, almost bent to the dust with the burden of her miseries. The first night she received shelter in the house of a respectable "much-ried" widow, who was the only person she could freely speak to about her destitute condition. Next day, by the advice of this good woman, she took a room in the neighbourhood, and endeavoured to gather together her pupils, who, it seems, did not desert her, but took a deep interest in her misfortunes. She had also the good fortune to get her boy into one of the educational hospitals, and she, therefore, expressed herself thankful for the mercies she still received.

An interval of many years now occurs in the story of Mrs Dempster, during which she heard nothing of her husband, except a rumour that he was drowned on a lumbering excursion in the rapids of the St Lawrence. Through the influence of her pitiable tale and real merit, she obtained the situation of superintendant of a large public seminary for young ladies in a country town. Here she lived in peace, comfort, and honour, for some years, till she had almost forgot that ever such a wretch as Dempster existed. What was her horror one day, when, as she was entertaining a large party of respectable people at tea, the demon of her fate stood once more before her, not the mere squalid beggar which he formerly appeared, but a concentration of blackguardism and shabbiness, of utterly ruined and broken down humanity, such as was never perhaps surpassed, even in the sinks of London and Parisian vice. There was now more than mendicancy in his aspect—there was robbery, murder, and every kind of desperate deed. The wan face, blackened and battered with bruises and wounds—the troubled eye, bespeaking the troubled spirit—the rosy, sooty attire, through which peeped the hardly whiter skin—the feet bare and plicated with walking—every thing told but one tale of unutterable sin and misery. The guests shrunk aghast from this hideous spectre, and the hostess shrieked outright. Little regarding the alarm which he had occasioned, he exclaimed, in a hollow and scarcely earthly voice, "Give me meat—give me drink—give me clothing—I am destitute of all: there you sit in enjoyment of every luxury, while your husband, who is flesh of your flesh, has not known what it is to eat heartily, or to be covered from the piercing wind, for weeks and months. Do not shrink from me. Wretched as I seem, I am still your husband. Nothing on earth can break that tie. Meat, I say—drink—I am in my own house, and will be obeyed. For you, gentles, get you gone; your company is not now agreeable." The company dispersed without further ceremony, leaving the unhappy woman alone with her husband.

Next day, the stranger appeared abroad in a decent suit of clothes, and Mrs Dempster seemed to have recovered a little of her equanimity. Every sacrifice, however, which she could make for this wretch, was in vain, or only encouraged him to demand greater indulgences. An unlimited supply of liquor in his own house would not satisfy him. He required large sums wherewith to treat all the *canaille* of the town. Entreaties, indulgences, every thing that could be devised to gratify him, were unavailing to impress him with a sense of his wife's situation. He intruded his unhallowed front into her school, and insulted her before her pupils. Those who laughed at his antics he would seize by the shoulders, and turn out of doors. He had also a most perverse desire of pushing

himself into her presence, whenever he thought she was conversing with any of her employers, before whom an observance of propriety and decorum was most particularly necessary. Indeed, he just delighted to do exactly what his wife wished him not to do; the grand object of his low mind being to show how much he had her comfort and welfare in his power. At length, with every feeling of respect for Mrs Dempster, her employers, the magistrates, found it necessary to inform her, that they could not permit her to retain the school any longer under such circumstances, as it was threatened with utter annihilation by the gradual diminution of the number of pupils. She proposed to her husband to allow him regularly the full half of her earnings, if he would only stay in some other place, and never again intrude upon her. But he scorned to be bought off, as he said. He insisted rather upon her giving up the school, and accompanying him to Edinburgh, where, with the little sum she had saved, and what besides they could raise by the sale of her superfluous furniture, he would enter into business on his own account, and should never again be obliged to work for either herself or for him. The poor woman had no alternative. She was compelled to abandon the scene, where, for so many years, she had enjoyed the comforts of life and the respect of society, in order to be dragged at the chariot wheels, or rather at the cart's tail, of her husband's vices and fortunes, through scenes to which she shuddered to look forward.

In the capital, Dempster's design of entering into business, if he ever seriously entertained it, was no more talked of. Fleeced once again with a taste of his former indulgences, he rushed headlong into that infamous career which already had twice ended in voluntary banishment. His wife's finances were soon exhausted; but, with the barbarity of a demon taskmaster, he would every day leave her with a threat, which she but too well knew he would execute, of beating her, if she should not be able to produce next morning a sum necessary for the gratification of his wretched appetites. It was now in vain to attempt that mode of subsistence by which she had hitherto supported herself. So long as she was haunted by this evil genius, that was impracticable. By the interest, however, of some of her former friends, she obtained a scanty and precarious employment for her needle, by which she endeavoured to supply the cravings of her husband, and her own simpler wants. From morning early, through the whole day, and till long after midnight, this modest and virtuous woman would sit in her humble lodging, painfully exerting herself at a tedious and monotonous task, that she might be able to give to her husband in the morning that sum without which she feared he would only rush into greater mischief, if not into absolute crime. No vigils were grudged, if she only had the gratification at last of seeing him return. Though he often staid away the whole night, she never could permit herself to suppose that he would do so again, but she would sit bending over her work, or, if she could work no more from positive fatigue, gazing into the dying embers of her fire, watching and watching for the late and solitary foot, which, by a strange exertion of the sense, she could hear and distinguish long ere any sound would have been perceptible to another person. Alas, for the sleepless nights which woman so often endures for the sake of her cruel helpmate! Alas, for the generous and enduring affection which woman cherishes so often for the selfish heart by which it is enslaved!

A time at length arrived when the supplies purveyed by Mrs Dempster from her own earnings were quite incompetent to satisfy this living vampire. She saw him daily rush from her presence, threatening that he would bring her to the extremity of disgrace by the methods he would take to obtain money. She lived for weeks in the agonising fear that the next moment would bring her news of some awful crime committed by his hand, and for which he was likely to pay the last penalty of the law. She hardly knew who or what were his associates; but occasionally she learned, from mutterings in his sleep, that his practices were of the most flagitious and debased kind. He seemed to be the leader or director of a set of wretches who made a livelihood by midnight burglary. At length, one day he came home at an unusual hour, accompanied by three strangers, with whom he entered into conversation in the next room. Between that apartment and the room in which she was sitting, there was a door, which, being never used, was locked up. Through the thin panels, she overheard a scheme laid for entering the house of —, a villa in the neighbourhood, in order to rob the tenant, whom they described as a gentleman just returned from the East Indies, with a great quantity of plate and other valuables. One of the persons in conference had visited the house, through the kindness of a servant, to whom he had made up as a sweetheart, and he therefore was able to lead the attack through such a channel as rendered success almost certain. "The nabob," said this person, "sleeps in a part of the house distant from the room in which his boxes are for the present deposited. But should he attempt to give us any disturbance, we have a remedy for that, you know." And here the listener's blood ran cold at hearing a pistol cocked. From all that she could gather, her husband was only

to keep watch at the outside of the house, while the rest should enter in search of the booty. It is impossible to describe the horror with which she heard the details of the plot. Her mind was at first in such a whirl of distracted feeling, that she hardly knew where she stood; but, as the scheme was to be executed that very evening, she saw it necessary to exert herself quickly and decisively; and, therefore, she immediately went to the house of a friend, and wrote an anonymous note to the person most concerned, warning him of a design (she could use no more specific language) which she knew was entertained against a certain part of his property, and recommending him to have it removed to some more secure part of his house. To make quite sure of this note being delivered in time, she took it herself to the gate, and left it with the porter, whom she strictly enjoined to give it immediately into the hands of his master. She then went home, and spent an evening of misery more bitter than the cup of death itself. She had formerly passed many a lonely night at her cheerless fireside, while waiting for the return of her wretched husband; but she never spent one like this. When she reflected upon the happiness of her early days, and the splendid prospects which were then said to lie before her, and contrasted them with the misery into which she had been so suddenly plunged, not by any fault of her own, but, as it appeared, by the mere course of destiny, she could have almost questioned the justice of that supreme power by which she piously believed the concerns of this lower world to be adjusted. What dire calamities had sprung to her from one unfortunate step! What persecutions she had innocently endured! How hopeless was her every virtuous exertion against the perverse counteraction of a being from whom society could not permit her to be disjoined! And, finally, what an awful outburst of wretchedness was at this moment, to appearance, impending over her! Then she recalled one gentle recollection, which occasionally would steal into her mind, even in her darkest hours, and fill it with an agreeable, but still painful light—the thought of Russell—Russell, the kind and good, whom, in a moment of girlish vanity, she had treated harshly, so that he vanished from her presence for ever, and even from the place where he had suffered her scorn. Had fate decreed that she should have been united to that endeared mate of her childhood, how different might have been her lot! How different, also, perhaps, might have been his course of life—for she feared that her ungenerous cruelty had also made shipwreck of his noble nature. These meditations were suddenly disturbed by the entrance of Dempster, who rushed into her room, holding a handkerchief upon his side, and, pale, gory, and breathless, fell upon the ground before her. Almost ere she had time to ascertain the reality of this horrid vision, quick foot-steps were heard upon the stair. The open door gave free admission; and in a moment the room was half filled with watchmen, at the head of whom appeared a middle-aged gentleman of a prepossessing though somewhat disordered exterior. "This," he exclaimed, "is the villain; secure him, if he be yet alive, but I fear he has already met the punishment which is his due." The watchmen raised Dempster from the ground, and, holding his face to the light, found that the glaze of death was just taking effect upon his eyes. The unhappy woman shrieked as she beheld the dreadful spectacle, and would have fallen upon the ground if she had not been prevented by the stranger, who caught her in his arms. Her eyes, when they first re-opened, were met by those of RUSSELL.

It would be difficult to describe the feelings with which these long-severed hearts again recognised each other, the wretchedness into which she was plunged, by learning that her well-intended efforts had unexpectedly led to the death of her husband, or the returning tide of grateful and affectionate emotion which possessed his bosom, on being informed that those efforts had saved his life, not to speak of the deep sensation of pity with which he listened to the tale of her life. A tenderer feeling than friendship was now impossible, and, if it could have existed, would have hardly been in good taste; but Russell, now endowed with that wealth which, when he had it not, would have been of so much avail, contented himself to use it in the pious task of rendering the declining years of Eliza Farney as happy as her past life had been miserable.

POPULAR INFORMATION ON LITERATURE.

FIRST ARTICLE.

THERE is a large class of inquiring minds in the humbler walks of life, and another large class composed of the young of all orders, who, in entering upon a course of general modern reading, must be greatly at a loss for a knowledge of many men and books which are familiarly alluded to, and things with which every body is understood to be acquainted, but which, in reality, are only familiar to persons of perfect education, and to those who have been living for a considerable time in intimate converse with the world. It appears to be a proper object for such a work as the present, to supply such information on modern literature as may help to bring up the minds now spoken of to a level with those which are generally addressed by literary men; so that the large class of persons who at the present time are

just beginning to read, or are anxious to do so, may have less difficulty at the first. The manner in which I shall endeavour to supply this information will be peculiar. I shall write as if I understood my readers to be almost entirely ignorant; and, therefore, my disquisitions may perhaps appear to more informed persons as childish. I trust, nevertheless, that every one will excuse the introduction of matter which is to him quite familiar, for the sake of the multitudes to whom it will be nearly altogether new.

It is probable that SIR WALTER SCOTT is the author of all others whose name is most familiar to the persons now addressed. He is a native of Edinburgh, about 60 years of age, originally, by profession, an advocate in the chief Law Court of Scotland, but latterly settled in the respectable office of a clerk to that Court, from which, however, he has lately retired. Walter Scott began his literary career as a collector of old Scottish ballad poetry, and an imitator of that style of writing. He published, about the beginning of this century, a collection of ballads, under the title of the *Minstrelsy of the Scottish Border*, which was looked upon as a very pleasing and very learned work. He next published, under the title of the *Lay of the Last Minstrel*, a romantic poetical tale of his own composition, being somewhat in the style of those old ballads. This book was in one volume, and it was so much liked that 25,000 copies were sold in the first six years. In 1808, two years after the *Lay* had appeared, he published a second and similar romantic poem, under the title of *Marmion*, for which a bookseller paid him no less a sum than one thousand guineas. It was fully more admired than the former work; and his next attempt, the *Lady of the Lake*, was most admired of all. The success of these fine poems induced him to write two others in succession, styled *Rokeby*, and the *Lord of the Isles*; but either the story was not in those cases so interesting, or the style of the author was becoming a little too familiar; for they were not nearly so much admired as the previous productions. Mr Scott, who is a man of much worldly sagacity, as well as great poetical genius, saw that it was necessary to write in a different manner, in order to please his customers, the public; and so he began to write romances in prose. Having an idea that his name was getting somewhat hackneyed, he resolved to publish these works anonymously. The first that appeared was *Waverley*, a story founded upon the rebellion of the Scotch Highlanders in 1745—in three volumes. It met with as great success as the first of his poems. Every one who read it was delighted with its lively descriptions of scenery, its natural delineations of character, and a peculiar romantic charm which this author invariably gives to every incident of past history to which he alludes. *Waverley* appeared in the year 1814; and ever since down to the very present time, this great author has continued to publish every year one or more narratives of the same kind, generally relative to some incident in Scotch or English, or occasionally foreign history. As he derived a great deal of money from his writings, he was enabled to purchase a considerable quantity of land in one of the southern counties of Scotland, where he built a house called *Abbotsford*. In consideration of the literary honour which he reflected upon his country, King George IV. conferred upon him the dignity of a baronetcy in the year 1820. He continued to publish without putting his name upon the front of his books, down till 1826, when his Edinburgh bookseller became a bankrupt, and involved him in pecuniary embarrassments, which rendered it impossible for him any longer to conceal that he was the *Great Unknown* who had so long delighted the world with his romances. It was understood that Sir Walter was engaged for this bookseller in obligations to the amount of sixty thousand pounds, being a great proportion of all that he had ever received for his writings. Thus, in one respect, a series of literary exertions, the most splendid the world has ever known, was, in a great measure, rendered ineffectual. Sir Walter, however, has since been enabled to gain so much money as has cleared off nearly the whole, if not the whole, of this vast debt. It is only to be lamented that his health has, in a great measure, sunk under the effort. On this account, he is at present sojourning in Italy, for the benefit of a milder climate than his own. The personal character of this great man is as much to be admired as his literary merits. He has been conspicuous all his life for the amiable and dignified simplicity of his manners—the perfect purity of his moral conduct—his benevolence and kindness towards all his fellow-creatures—and a total want of those mean, narrow feelings, such as jealousy or envy, which so often have degraded genius to a level with ignorance. He was married in early life to a French lady of the name of Carpenter, who left her native country in consequence of the Revolution, and who died in 1826. By this lady he had two sons and two daughters, all of whom are now arrived at maturity.

Among the great literary intellects, ROBERT SOUTHEY is to be next mentioned. He is a native of England, about the same age as Sir Walter Scott, and has lived for many years in an elegant retirement near the village of Keswick, in Cumberland. In his early years, like most young men of the period, he was captivated with the principles of the French Revolution, and wrote a play called *Wat Tyler*, which abounds in sentiments of that nature. Mr Southey subsequently changed his opinions in politics; and, as this has often been urged against him, he perhaps feels the publication of his first production to have been the most fatal error in his life. Mr Southey is essentially and exclusively a man of letters; that is to say, he lives by what he can obtain for his writings. In early life he wrote a series of poetical narratives, of a wild and wondrous nature; the most remarkable are respectively entitled *Thalaba* and *Madoc*. A rich and luxuriant imagination was observable in these works; but they were accused of being written too much in defiance of the ordinary rules of poetry. Hence, Mr Southey's poems are

not now read. Like many other men of poetical genius in the present age, he has betaken himself to the composition of prose—the kind of composition, after all, most adapted to the daily wants of the reading part of mankind. He has published many large and most respectable prose works, such as the *Book of the Church* (a brief ecclesiastical history of England, in which he strongly advocates the principles of the Reformation), in two volumes; *Colloquies on the Prospects of Society*, in two volumes, &c. But his chief exertions are said to lie in the *Quarterly Review*, a periodical work afterwards to be described. Mr Southey is allowed to be one of the best, or purest, writers of the English language now living. He possesses, in his house at Keswick, a large miscellaneous library, in which he almost constantly lives. He enjoys the small, but honourable sinecure office of Poet Laureate, to which there is attached a pension of a hundred pounds a year, with the addition of a pipe of wine. Formerly the Poet Laureate was a regular member of the King's household, for the purpose of saluting him on his birth-day with an appropriate ode. But the ode is now dispensed with, and the pension and wine only form a kind of encouragement to some meritorious man of letters, to whom the country may be supposed to be indebted. It may be mentioned that both Sir Walter Scott and Mr Southey are Tories.

Next to Southey may be mentioned THOMAS CAMPBELL, author of a poem entitled the *Pleasures of Hope*. This gentleman is a native of Scotland, but for thirty years past has resided in London. He is somewhat younger than Scott and Southey. He received his education at the University of Glasgow; and in 1801, when scarcely out of his teens, published at Edinburgh his *Pleasures of Hope*, which at once gained a wide popularity. This poem is a series of fine bursts of sentiment, expressed in the most glowing and beautiful language, with only here and there a monotony of rhymes, and redundancy of expression, which may well be excused as the faults of a very young author. Mr Campbell afterwards produced several smaller poems of great beauty, among which must be mentioned the sublime odes, entitled *Hohenlinden*, the *Battle of the Baltic*, and, "Ye Mariners of England." The muse of Campbell was more correct in pace than abundant in effusion. He produced no poem of considerable length for ten years after he had written the *Pleasures of Hope*. At length, in 1809, appeared *Gertrude of Wyoming*, a beautiful narrative poem, founded on an incident in the history of an American settlement. This forms almost the sum of Mr Campbell's literary exertions. In 1821, he undertook the management of a monthly periodical work, entitled the *New Monthly Magazine*; but it was always understood that little of the work was his own composition. In truth, it is the misfortune of Mr Campbell that he has a natural and habitual reluctance to exertion. A pension which he enjoys from the government supplies most of his daily wants, and he is content to pass in indolence days and years of which his contemporaries would be disposed to ask from him a very different account. It is not too much to say that there are many men of letters in Britain who have undergone as much labour in one year, as this gifted son of genius has undergone in the whole thirty years of his literary existence.

WORDSWORTH and COLERIDGE are the names of two living poets, whose writings are hardly known to any part of the reading public, but who are nevertheless entitled to notice. The former is a quiet, retired, old gentleman, who has spent nearly the whole of his life in a secluded part of Cumberland, deriving his support from some sinecure office. He has written a large poem called the *Excursion*, and many smaller ones, some of them in the style of ballads, &c. This poet made a great mistake in the beginning of his career, and he never has since got out of it. He conceived that the best subjects for poetry are to be found in the incidents and characters of humble life, and that the language to be employed should be as nearly as possible that used in the same walk. Hence many of his poems have been childish and unmeaning jingles, while still, here and there we find strains of profound sentiment, and a feeling of nature and her workings, such as to make us regret that so noble a mind should have been so strangely lost. The language, too, is not always of the mean kind alluded to. It is often for a large space the most touching, the most tender, the most melodious, that is to be found in modern literature. Indeed, Wordsworth may be described as one of the great poetical minds of the country, but with the detracting qualification, that it is in a state of partial weakness. Coleridge is even a still more pitiable specimen of crazy greatness. His works, however, are so entirely out of the public sight, that it is unnecessary to give any account of them.

Hardly any of the above persons, though still alive as men, can be said to live as poets. Their exertions in this walk of literature have been for many years given up, and almost forgotten. If they now work at all, it is as prose writers. Poetry, indeed, has not been a profitable field of adventure for some years. It has given way in a great measure to certain more fashionable kinds of literature, such as novels and periodical works. BYRON, a young, dissolute nobleman, who died in 1824, was the greatest poet of modern times; and certainly his writings have enjoyed a high degree of popularity; but few of the rest have made a great impression by their verses. THOMAS MOORE is a name entitled to notice. His chief poetical work is called *Lalla Rookh*, (a romance of Asiatic life), and he has also derived great celebrity from a series of songs which he has composed for the airs of Ireland, which is his native country. Moore, however, has too little of that nature of which Wordsworth aims at having too much. His sentiments are not the spontaneous

gushings of the full and feeling heart, but a cold and artificial effusion measured out according to rule. His way of making up his verses is as artificial as his sentiment. He forces images from the ends of the earth, and plants them here and there along his verses, as an African prince places Birmingham buttons upon his native clothing, not for their use, but that he thinks some ornament looks better at that place. His similes might be chipped off his verses, as easily as so many handles from so many tea-cups, without in the least impairing the quantity of the vessel. He must be allowed credit, however, for the ingenuity with which he can drag the most untoward ideas into his verses. It must be acknowledged that, though the forcing is always visible, the case would evidently be much worse, or not practicable at all, in the hands of a less perfect adept. This is also the less favourable view of Moore's poetry. If the constant appearance of labour could be overlooked, his gay vivacious fancy would give unmingled pleasure.

Among the multitude of men poetically dead, but personally living, may further be mentioned, SAMUEL ROGERS, LEIGH HUNT, and JOHN WILSON. Rogers is an aged man of fortune, residing in the vicinity of London. Towards forty years ago, he published the *Pleasures of Memory*, a poem full of the gentlest feelings and most beautiful images, though it would now, perhaps, be held as a little too cold in tone. Rogers is now rather a patron and friend of literary men, than a poet himself, though it is not above ten years since he produced a very elegant poem in blank verse, styled "Italy." Leigh Hunt is a middle aged man, a native of London. He began his poetical career about twenty years ago, his first works being *Rimini*, the *Feast of the Poets*, &c., which made a considerable impression upon the public, though not written in the best taste. Hunt is a man of good intentions, but corrupted a little by education, mannerism, and perhaps vanity. His poetry is about to be republished in a purified and collected form, we regret to say, as a means of relieving himself from the bitter evil of reduced circumstances, accompanied by ill health. John Wilson is a native of Scotland, but educated chiefly in England. He first appeared in the literary world about twenty years ago, as author of several volumes of poetry, under the various titles of the *Isle of Palms*, the *City of the Plague*, &c. His verses received praise in the *Edinburgh Review*, and other critical works of eminence, where it happens that many books receive the only notice they are ever destined to be blessed with. Dr Johnson says of a novel by Congreve, that he would rather praise it than read it; and to this principle may be traced the reputation of many more famous poems than those of Mr Wilson. The poetry was most excellent poetry—there could be no doubt of that, for several high critical oracles were most decided upon the point; but the public has sometimes an obstinate way of its own with books—it would not believe a word of it. Hence Mr Wilson's poems never were honoured with the least mark of popular acceptance—could scarcely be said, indeed, to have ever been published. Like many other writers of poetry, he has latterly turned his attention to prose. He has written several tales and sketches depicting Scottish humble life, but in such a sickly, romantic, and exaggerated style, that the original is hardly to be recognised. By profession, Mr Wilson was originally an advocate at the Scottish bar, but some years ago he was installed Professor of Moral Philosophy in the University of Edinburgh, which office he continues to occupy. He has also, for many years, been the editor or chief contributor to that extensively circulated monthly work, *Blackwood's Edinburgh Magazine*; a task for which he seems to be eminently fitted. His mind, it must be remarked, though gifted with only a few leading ideas, possesses the strange power of showing these once every month in a new shape, generally diluted into a lavish effusion of brilliant, though unpolished verbiage; and in this way he continues to keep up a constant succession of dashing, frothy articles in the work referred to. I mentioned that Southey was reckoned the writer of the best or purest English in the present day; on the same principle Wilson may be reckoned among the coarsest. His frolicsome, loose style is exceedingly captivating, and has produced a host of imitators among young writers, not one of whom has approached him in point of talent or brilliancy; and the consequence has been, a perfect inundation of flippant, useless writing, in every department of periodical literature. Mr Wilson enjoys a considerable local fame on account of these contributions to *Blackwood's Magazine*; but as his name is connected with no individual work that can have the least claims upon posterity, it is easy to predict that this must not only be confined to the scene, but also to the period of his exertions.

GREAT BRITAIN.

In whatever manner we are called upon to examine the character and circumstances of the inhabitants of Great Britain, we feel impelled to remark, that they are altogether an exceedingly peculiar people, and that they possess talents and properties possessed by no other nation under heaven—that of the great western republic, who are of British descent, always excepted. Their country is comparatively small, and its climate is inferior to that of any other in the neighbourhood, or in a large portion of Europe; yet under these disadvantages, they have contrived to place themselves at the head of the affairs of nearly the whole world, and to dictate the terms of their bargains with a confidence which certainly no other people has dared to imitate. The whole secret of all this superiority lies in their industrious habits and their intelligence. They have also been much indebted to the isolation of their country for the preservation of their national character: and a genealogist might fondly trace their great-

ness to the happy mixture of Celtic and Gothic blood, and the amalgamation of Saxon simplicity and steadiness of character with the gallant bearing of the Normans. Besides possessing these natural advantages, they have been fortunate in the enjoyment of security of property, since the rise of the middling classes in Henry the Seventh's time. If to this we add the possession of inexhaustible stores of mineral products, as iron, lead, tin, and coal, the cause is given of their extraordinary industry and opulence. The fossils which have been of the greatest benefit to the British people, are iron and coal. Without these no nation can be permanently great or independent. The iron of the Mendip Hills, Somersetshire, Derbyshire, North Wales, and Alston in Cumberland, as well as that used at Carron in Scotland, with the coal of Northumberland, Durham, and Lanarkshire, have reared a mighty fabric of trade, commerce, and machinery, no where paralleled, and which it would be impossible to supersede.

The whole of England, and some of the counties in Scotland, is but one immense manufactory, sectioned into divisions, and swarming with a population whose innate skill and industry put to shame the perseverance of the ant, or the ingenious labour of the bee. Let us, for example, take a glance at this wonderful human hive. Entering England from the north, we first fall in with the great trading district on the Tyne, covered with ship-building establishments, soaperies, glass works, potteries, iron foundries, and other works of a similar kind, connected with the coal trade and mines. In Cumberland, we find manufactories of gingham, calicoes, corduroys, and other cotton goods; sail-cloth, carpets, paper, pottery, and glass bottles. The hilly district of Westmoreland, we find, gives employment to the woollen manufactories of Kendal, and other towns in that quarter. In Durham are found extensive foundries and forges, producing anchors, mooring chains, files, edge-tools, sword blades, and all such hardware as is necessary for artificers. Yorkshire comes next, and we perceive it has an extraordinary variety of manufactories. The East Riding furnishes wool in large quantities to the weavers of the West Riding, which is without exception the greatest manufacturing district in the world. The manufactories of Leeds, Wakefield, Bradford, Halifax, Huddersfield, and places adjacent, comprise broad and narrow cloths of all qualities, shalloons, calimancoes, and flannels, with every kind of woollen goods. From Sheffield, cutlery, printing types, and plated goods, are exported to all parts of the world. The knives of Sheffield have been celebrated for many centuries. West from Yorkshire lies Lancashire, which is famed for the extent and variety of its manufactories, consisting of silk, cotton, woollen, linen, hats, stockings, pins, needles, nails, watch-tools and movements, tobacco and snuff, earthenware, porcelain, paper, and many other articles. In this busy scene lies Manchester—a city of cotton-mills and machinery, forming light fabrics of goods intended for the clothing of females, in every part of the globe which can be reached by merchants. Here also is manufactured an inconceivable variety of small wares, as tapes, threads, laces, &c. In the vicinity are situated the establishments for printing and dyeing the calicoes. In this district are also found manufactories of iron and copper, glass, white-lead, lamp-black, vitriolic acid, paints, &c. Liverpool is the great outlet for these products.

Proceeding down into Cheshire, we discover manufactories of silk, cotton, linen, ribbons, thread, buttons, leather, and salt. Shropshire, adjoining, has its coal, iron, and tar works, besides manufactories of garden flower pots, tobacco pipes, china, and queen's ware; also some linen and cotton manufactories. In Montgomeryshire, we find some of the best flannel manufactories in Britain. Let us retrace our steps, and view the centre of England. Here we find the stocking, silk, and lace manufactories of Nottinghamshire; the worsted, woollen, and hat manufactories of Leicestershire; the woollen, linen, cotton, silk, and polished marble manufactories of Derbyshire. The great wonder of England is the Staffordshire potteries, which occupy a central district. For ten square miles the whole land seems a series of volcanoes, as interesting, and a thousand times more profitable than those of Sicily, or the Neapolitan territories. An abundant supply of coal found here, has produced the establishment of these potteries, which give employment to an immense population, and send out Delft goods to every country. Warwickshire falls next under our notice. Here every town is celebrated for manufacturing some particular article. Birmingham is filled with manufactories of hardware, muskets, pistols, and other goods of a similar nature. In Coventry and neighbourhood, not less than sixteen thousand people are employed in manufacturing ribbons; and many are engaged in making watches, which are reckoned among the best in Britain. Gloves, horn combs, hosiery, flaxen goods, and needles, are a few more of the chief Warwickshire products. Worcester is the great mart of the glove and carpet trade. Gloucestershire has its manufactories of iron, tin-plate, edge-tools, brass wire, wire-cards, pins, and nails. On the water of Stroud, are extensive manufactories of fine scarlet, blue, and black cloths; the best worsted stuffs are made at Cirencester, and stockings at Tewkesbury. In Buckinghamshire, lace and paper are the chief manufactures. In Dunstable, Bedfordshire, straw plait is the principal source of employment. Kent has the most extensive paper-mills in the world; gunpowder, calicoes, sacking, and hop bagging, are also made to a great extent, and the various dock-yards of Deptford, Woolwich, Chatham, &c. employ numerous hands. In the southern county of Berkshire, sacking, paper, cotton, blankets, and copper, are manufactured. In Wiltshire, the finest woollens, flannels, broadcloths, kerseymeres, fustians, and gloves, predominate. Dorsetshire is celebrated for its twines, cordage, sail-cloth, nettings, and shirt-buttons; Somersetshire for its stockings, woollen cloths,

coarse linens ticks, and gloves. The metropolitan districts abound in manufactures, and in London itself almost every kind of goods is made and prepared for exportation. In all the large towns on the sea-coasts round the whole island, ship-building is carried on to a greater or less extent, and which necessarily engages a variety of local manufactures. Such is a superficial glance at the pursuits of industry in England alone (for I find I must leave Scotland to form the subject of another paper); and in these are demonstrated some of the main causes of the true glory and prosperity of the empire.

ORIGINAL ANECDOTES REGARDING BURNS.

OUR native Poet Burns is so great a favourite with his countrymen, and we hear all that regards him with so much interest, that I am sure my readers will be pleased with the few authentic gleanings with which I now present them.

It is mentioned in Dr Currie's *Life of the Poet*, that when he was in Edinburgh, he accompanied his friend, Mr Robert Ainslie, now Writer to the Signet, on a horse-back excursion from Edinburgh to Peebles, down the Tweed, all the way to Coldstream, and from thence to Berrywell, near Dunse, the residence of Mr Ainslie's father. The weather was charming; the parties then youthful and in good spirits; and the Poet delighted with the fine scenery, and the many poetical associations connected with it. When they arrived at Coldstream, where the dividing line between Scotland and England is the Tweed, Mr Ainslie suggested going across to the other side of the river by the Coldstream bridge, that Burns might have it to say he "had been in England." They did so, and were pacing slowly along on English ground, enjoying their walk, when Mr Ainslie was astonished to see the Poet throw away his hat, and, thus uncovered, look towards Scotland, kneeling down with uplifted hands, and, apparently, in a state of great enthusiasm. Mr Ainslie kept silence, uncertain what was next to be done, when Burns, with extreme emotion, and an expression of countenance which his companion will never forget, prayed for and blessed Scotland most solemnly, by pronouncing aloud, in terms of the deepest devotion, the two concluding stanzas of the *Cottar's Saturday Night*.

Oh Scotia! my dear, my native soil!

For whom my warmest wish to Heaven is sent!

Long may thy hardy sons of rustic toil

Be blest with health, and peace, and sweet content!

And, oh! may Heaven their simple lives prevent

From luxury's contagion, weak and vile!

Then, howe'er crowns and coronets be rent,

A virtuous populace may rise the while,

And stand a wall of fire around their much-lov'd Isle.

O Thou! who pour'd the patriotic tide

That stream'd through Wallace's undaunted heart;

Who dar'd to nobly stem tyrannic pride,

Or nobly die, the second glorious part,

(The patriot's God, peculiarly thou art,

His friend, inspirer, guardian, and reward!)

O never, never Scotia's realm desert;

But still the patriot, and the patriot bard,

In bright succession raise, her ornament and guard!

In the course of that excursion, they went to visit an old gentleman, a friend of Mr Ainslie's, in Teviotdale, who was possessed of an arm chair that had belonged to Thomson, the Poet of the Seasons. This Burns examined, and sat in with great interest, as if catching inspiration by the very touch of it.

Some time after that, the Poet was a considerable time in Edinburgh, visiting Mr Cruikshanks, then one of the masters of the High School, who lived in St James's Square, New Town. Mr Ainslie had then a small bachelor house on the north side of the same square, and, intimate as the parties were, it may be supposed they spent many an hour together; and, to Mr Ainslie, most agreeable they were. He remembers one pleasant summer afternoon, the Poet came over to him after dinner. Mr Ainslie was then but a Writer to the Signet's apprentice, but had already a cellar, though it must be admitted it was no extensive one, for it was no more than a window bunker, and consisted but of five bottles of port—all that remained of a dozen which had been his laid-in store; but it was excellent, and old, and got from a wine-merchant who favoured him. He was too hospitable not to offer a bottle to his friend, and that friend was one of the *finest fellows* in the world. What, then, was to have been expected to happen? that some nice points would have been discussed—an exercise in which the Poet displayed great eloquence—and many a fine quotation made, in which he constantly indulged with great fervour; and, lastly, that several of the poor five bottles might have suffered in the cause, to the great elucidation of all the questions, and the increase of the beauty and sublimity of the passages quoted. But no such thing. "No, my friend," said Burns; "we'll hae nae wine the day; to sit dozing in the house on sic a glorious afternoon as this. Besides, ye ken you and I dinna require wine to sharpen our wit, nor its adventitious aid to mak us happy. No; we'll tak a walk about Arthur Seat, and come in to a late tea." The two did so; and his companion says he never found the Poet so amusing, so instructive, and altogether so delightful, as he was in the charming stroll which they had together, and during the sober "tea drinking" which followed it.

I mentioned above that Burns was extremely fond of quoting, in society, favourite poetical passages; but, in his correspondence with his intimates, he indulged himself also in doing so, much to their gratification. In a late small book on the *Evidences of Natural and Revealed Religion*, called "*Reasons for the Hope that is in us*," lately written by the same gentleman to whom I have been alluding as the companion of the Bard, he concludes one of the Essays of which it consists, namely,

that on the "Immortality of the Soul," with two fine verses which were sent him in that manner by the Poet, though not said to have been composed by him; and the author annexes an explanatory note regarding them. I first give the verses, and then Mr Ainslie's note. The letter was on the prospect of a Happy Eternity, and Burns concluded his reflections thus:—

'Tis *this*, my friend, that streaks our morning bright;

'Tis *this* that gilds the horror of our night.

When wealth forsakes us, and when friends are few;

When friends are faithless, and when foes pursue:

'Tis *this* that wards the blow, or stills the smart,

Disarms affliction, or repels the dart;

Within the breast bids purest rapture rise,

Bids smiling conscience spread her cloudless skies.

The following are the terms of Mr Ainslie's note:—"These lines I find in a letter written to me by Burns, forty years ago. He had his memory stored with the finest poetical passages, which he was in the habit of quoting most aptly in his correspondence with his friends; and he delighted also in repeating them when in company with those of them who enjoyed them. Living, as I did, in habits of close intimacy with him during his residence in Edinburgh, when he published the second edition of his poems, often have I heard him recite these fine verses, which seemed to have made much impression on him. Poor Burns! Those who were best acquainted with him knew that he viewed and considered these noble and interesting subjects as he ought. The lapse of fleeting years is fast dissipating the remains of unkind feeling with which some latterly regarded him; and while his country justly appreciates him, his fame will descend to future times, worthy of the author of *THE COTTAR'S SATURDAY NIGHT*."

BIOGRAPHIC SKETCHES.

REGINALD HEBER.

REGINALD HEBER, equally distinguished for his talents and for his piety, was born on the 21st of April 1783, at Malpas, in the county of Chester. From his earliest years religion was the predominant feeling of his mind. His passions, which would seem to have been naturally ardent, he quickly learned to hold in subjection, and was thus happily delivered from those stormy agitations and poignant regrets to which those who are formed of more fiery materials are but too frequently liable. Like most other men who have been remarkable for their attainments in after life, Heber was strongly addicted, while a boy, to extensive miscellaneous reading, and at the same time his study of the Sacred Scriptures was incessant.

In the year 1800, Heber was entered a student of Brazen Nose College, Oxford, where he exhibited on all occasions the same high sense of religion, and primitive piety, which had distinguished him in his earlier years. His studies, in the mean while, were pursued with passionate ardour, particularly all those which were connected with poetry, of which his soul was as yet a fountain, as it were, and which, if possible, cast additional beauty and splendour on his faith. His principal poetical work at this period was his "Palestine," which he was called on to recite in the theatre of the college. None will ever forget his appearance on this occasion, so interesting and impressive. It was known that his old father was somewhere sitting among the crowded audience, when his universally-admired son ascended the rostrum; and it is said that the sudden thunder of applause which then arose so shook his frame, weak and wasted by long illness, that he never recovered it, and may be said to have died of the joy dearest to a parent's heart. In the autumn of 1804, same year, he was elected a fellow of All Souls College; shortly after which, his academical career terminated. He now entered on the active stage of life. About the middle of the year 1805, he accompanied his early friend, Mr John Thornton, on a tour through the north of Europe, proceeding through Sweden and Norway to St Petersburg. Here they remained some time, amusing themselves with learning the German language. The travellers next proceeded to Moscow, where they arrived on the 3d of January 1806. Upon leaving this city, in which Heber was dazzled with the gorgeous splendour of the inhabitants, they proceeded southward through the Ukraine, the country of the Cossacks. They next traversed the Crimea, Russian Poland, Hungary, Austria, and Northern Germany. In October 1806, both arrived in England, and Heber immediately set forward to join the family circle at Hodnet, in Shropshire, where he enjoyed the satisfaction which every wanderer feels when returning, after a long and toilsome journey, to his native home.

In the year 1807, Heber took orders, and obtained the living of Hodnet, which was in his brother's gift; he then returned to Oxford for the purpose of taking his degree as master of arts. It will readily be supposed that he, whose piety was truly apostolical, even while in a secular station, now that he had assumed the habit of a Christian minister, became doubly anxious to render not only his conduct, but the very thoughts of his mind, pure as became his holy calling. The Church of England has in no age been destitute of teachers remarkable for their virtue and benevolence; but, even among preachers of the gospel, it is not often that a man so gifted as Heber with genius, with enlarged knowledge of mankind, with almost boundless charity and benevolence, can be found, the perusal of whose life must create in the reader the vain wish that he had been numbered among his friends. Yet Heber was far from being an ascetic. Like all men of high imaginative powers, who have never suffered vice to brush away the down from the nobler feelings, he had a bold faith in the enduring nature of worldly affection. In April 1809, he married Amelia, youngest daughter of Dr Shipley, Dean of St Asaph. On this occasion he undertook an excursion in Wales, the beauties of which, notwithstanding the variety of scenes he had beheld, he seemed to consider equal to those of any country in the world. He

then settled in his rectory, and employed himself earnestly in diffusing among his parishioners a proper sense of religion, and habits of piety and virtue. "He became indeed," says his excellent widow, "their earthly guide, their pastor and friend. His ear was never shut to their complaints, nor his hands closed to their wants. Instead of hiding his face from the poor, he sought out distress; he made it a rule, from which no circumstances induced him to swerve, to 'give to all who asked,' however trifling the sum; and whenever he had an opportunity, he never failed to inquire into, and more effectually to relieve, their distress. He could not pass a sick person, or a child crying, without endeavouring to soothe and help them; and the kindness of his manner always rendered his gifts doubly valuable."

Heber, whose leisure, however, was not considerable, was more led by a praiseworthy literary ambition to become a contributor to the Quarterly Review, where many of the excellent critiques on books of travels, which appeared about that period, were of his writing. In 1812, he gave to the world the collected edition of all his poetical works. It seems he was an early riser, and, having performed his daily devotions, devoted the larger portion of the day to literature; from which, nevertheless, he was ready to separate himself at the call of duty. In 1815, he was appointed Bampton lecturer, and two years afterwards he was promoted to a stall in the cathedral of St Asaph. In the autumn of 1820, he paid a visit to Oxford, where he had the inexpressible gratification of hearing "Palestine" performed as an oratorio in the same theatre, where seventeen years before he had recited it with such acclamations of applause.

About the close of the year 1822, Heber received through his friend, the Right Honourable Watkins William Wynn, the office of the bishop of Calcutta. Our traveller had long viewed with deep interest the progress of Christianity in the east, and the prospect opened to him by this office, of contributing by his own zeal and exertions to the success of so holy a cause, seems quickly to have outweighed in his mind every consideration of personal interest, and to have determined him, at all hazards, to accept of that dangerous post. The conduct of Mr Wynn on this occasion—his ardent desire that India should not be deprived of the services of so good, so great a man (for virtue, like Heber's, is true greatness), while he was scarcely less unwilling to lose, certainly for a considerable time, if not, as it happened, for ever, a friend of incomparable value—reflects the highest honour on his heart and character. All the preliminaries being settled, Heber prepared to leave England. As soon as his intentions became known, he received from every quarter those warm voluntary testimonies of affection and regret which nothing but virtue, distinguished, persevering, exalted, can command. His own parishioners, as was natural, were the foremost in their demonstrations of their profound esteem. Rich, poor, old, and young—all joined in presenting their exemplary pastor with a lasting mark of the veneration in which his character was held among them. "Almost the last business," says Mrs Heber, "which Dr Heber (he had recently been created D.D. by the University of Oxford) transacted before he left Shropshire, was settling a long standing account in which he had been charged as a debtor to the amount of a hundred pounds; but it was believed by those who were best acquainted with the circumstances, that he was not bound either in law or probity to pay it. As he himself, however, did not feel certain on this point, he resolved to pay the money, observing to a friend who endeavoured to dissuade him, 'How can I reasonably hope for a blessing on my undertaking, or how can I commence so long a voyage with a quiet conscience, if I leave even the shadow of a committed act of injustice behind?' On the 22d of April 1823," she continues, "Dr Heber finally took leave of Shropshire. From a range of high grounds near Newport, he turned back to catch a last view of his beloved Hodnet; and here the feelings which he had hitherto suppressed in tenderness to others, burst forth unrestrained, and he uttered the words which have proved prophetic, that he 'should return to it no more!'"

Heber, having made all necessary preparations for his long voyage, and received consecration, repaired, on the 16th of June, on board the company's ship *Grenville*, in which he and his family were to proceed to India. As our traveller's first desire, in whatever position he happened to be placed, was to effect all the good in his power, he no sooner found himself on board than he endeavoured to communicate to the sailors a sense of their religious duties; which he did with all that authority and effect which genius and virtue invariably exert over inferior individuals. His exhortations were listened to attentively and respectfully, and, there can be no doubt, produced, in many instances at least, conviction and amendment of life. On the 3d of October, the ship safely anchored in Sangor roads, in the Hooghly, or great western branch of the Ganges. Heber was now arrived in the most extraordinary region, Greece and Egypt perhaps excepted, which has ever been inhabited by mankind.

They now entered the mighty Ganges, and, sailing up towards Calcutta through the Sunderbunds, or rather along their western limit, beheld their dark impenetrable forests stretching away interminably towards the right, while a rich vegetable fragrance was wafted from the shore. The current of the river, when increased by the ebb-tide, was found as they ascended to be tremendously rapid, running at no less a rate, according to their pilot, than ten or eleven miles an hour. On arriving at Calcutta, Heber found that the ecclesiastical business of his bishopric, at all times multiplex and extensive, had now, since the death of Dr Middleton, accumulated prodigiously; so that, although he had come out neither with the expectation nor the wish to find his place a sinecure, he felt somewhat alarmed at the laborious prospect before him. However, he was a man accustomed to labour, and not easily discouraged. He therefore diligently applied himself to business, and had soon the

satisfaction to find that, notwithstanding the formidable appearance of things on his first arrival, it was still possible, after fully performing his duty, which no consideration could induce him to neglect, to command sufficient leisure for studying whatever was curious or striking in the natural or moral aspect of Hindoostan. Former travellers, he now found, were, notwithstanding their numbers, very far from having exhausted the subject, either because the phenomena of Asiatic manners are, like those of the heavens, in a state of perpetual change, or because, these continuing the same, which, however, they do not, appear under various phases to different men, from being viewed by each individual from the peculiar point of observation afforded by his character and acquirements.

In the course of seven months, Heber had achieved that portion of his task which was to be performed in the capital. Next to this in importance was his visitation through the Upper Provinces, an expedition in which he had hoped to be accompanied by his family; but this being rendered impracticable by the delicate health of his wife, and the tender age of his infant child, he departed with his domestic chaplain, Mr Stowe, in a sixteen-oared pinnace, for Dacca. The shores of the Ganges, though flat almost throughout Bengal, are far from wanting in stately or picturesque objects: lofty pagodas, with their fantastic angular domes, towering over forests of bamboos, banyans, and cocoa-trees; ruins of Mussulman palaces; wild tracts of jungle inhabited by tigers; groves of peepul or tamarind trees; with Hindoo villages or hamlets, perched upon artificial mounds to escape the periodical inundations of the river.

Thus our traveller sailed from Calcutta to Dacca. Furreedpoor, his next station, did not long detain him. Near Rajmahal he approached, but did not visit, the ruins of Gour, an ancient city, which almost rivalled Babylon or Nineveh in extent, and which fell to decay, because the Ganges, which once flowed under its walls, changed its bed, and took another direction, six or seven miles south of the city.

From thence he proceeded, as before, up the Ganges, observing whatever was remarkable, making a short stay at each of the European stations on his way, for the purpose of preaching or baptising, and arrived on the 20th of August at Patna. At this city, which is extensive, and situated in a commanding position, he remained several days, for the purpose of preaching and administering confirmation. He then continued his voyage to Ghazeepoor, famous for its rose-gardens and salubrious air. "The rose-fields, which occupy many hundred acres in the neighbourhood, are described as, at the proper season, extremely beautiful. They are cultivated for distillation, and for making 'attar,' or rose water.

A short way further up the stream, Heber quitted his pinnace, and, providing himself with bearers, continued his journey to Benares by land. Heber's stay in Benares was short. He visited with attention its principal curiosities, and conversed on several points with some of its Brahminical professors, whose belief in Hindooism he regarded as very equivocal. He then continued his voyage up the river to Allahabad, where he dismissed his pinnace, and made the necessary preparations for performing the remainder of his journey by land.

At Lucknow Heber separated from his companions; and, accompanied merely by his attendants, directed his course towards the wild districts at the foot of the Himalaya. On arriving at Bareilly, not more than fifty miles distant from the nearest range, he vainly looked out for the snowy peaks of this "monarch of mountains;" but, instead, discovered nothing but a ridge of black clouds, and a gray autumnal haze through which no object was discernible. The features of the country now became wild and striking. Forests infested by malaria, tigers, and lions, and half desolate plains, announced the termination of the fertile provinces of Hindoostan, and the approach to a different region. Here "we had," says Heber, "a first view of the range of the Himalaya, indistinctly seen through the haze, but not so indistinctly as to conceal the general form of the mountains. The nearer hills are blue, and in outline and tints resemble pretty closely, at this distance, those which close in the vale of Clwyd. Above these rose what might, in the present unfavourable atmosphere have been taken for clouds, had not their seat been so stationary, and their outline so harsh and pyramidal—the patriarchs of the continent, perhaps the surviving ruins of a former world, white and glistening as alabaster, and even at this distance, of probably one hundred and fifty miles, towering above the nearer and secondary range, as much as those last (though said to be seven thousand six hundred feet high) are above the plain in which we were standing. I felt intense delight and awe in looking on them, but the pleasure lasted not many minutes; the clouds closed in again, as on the fairy castle of St John, and left us but the former gray cold horizon, girding in the green plain of Rohiland, and broken only by people and mango trees.

Next day, soon after sunrise, he saw distinctly, painted on a clear blue sky, the prodigiously lofty pinnacles of these mountains, which, as he justly observes, "are really among the greatest earthly works of the Almighty Creator's hands—the highest spots below the moon—and overtopping by many hundred feet the summits of Cotopaxi and Chimborazo." To approach these mountains, however, from the south, the traveller has to traverse a belt of forest and jungle, where the air is impregnated with the most deadly qualities. At the foot of these mountains stands Almora, the last point of Heber's journey in this direction; whence, after a short stay, he again descended to the plain, and pursued his route to Meerut, and thence to Delhi, the ruins of which extend over a surface as large as London, and is still the residence of the descendants of the Mogul sovereigns of India.

From Delhi, Heber proceeded to the still more ancient

capital of Agra, where the principal objects of curiosity "are the Motee Musjeed, a beautiful mosque of white marble, carved with exquisite simplicity and elegance; and the palace built by Akbar, in a great degree of the same material, and containing some noble rooms, now sadly disfigured.

Our traveller's journey through Rajpootana was attended by circumstances flattering to his personal feelings. The petty sovereigns through whose dominions his route lay invariably received him hospitably, when he visited their capitals, and on some occasions, when he did not choose to diverge so far from the road, sent messengers expressly to meet him on the way with polite invitations to their court. He pushed on, however, with considerable expedition, and having traversed the territories, and beheld the capitals of Jypoor, Ajmere, Bunnair, and others, proceeded, by way of Neemuch and Baroda, to Bombay. His time, during his stay in this city, was principally occupied with ecclesiastical business, in promoting the founding of schools, and in conversing with that venerable statesman and traveller, Mr Elphinstone, the governor, who, from the most humane and enlightened motives, has endeavoured, with success, to diffuse among the natives a knowledge of our literature and sciences. Here Heber had the satisfaction of being joined by his wife and elder child. With these, shortly afterwards, he visited the cavern temples of Elephanta and Kennerly; and subsequently, in company with Archdeacon Barnes, made an excursion across the Western Ghats to Poona, in the Deccan, during which he enjoyed an opportunity of examining another celebrated cavern temple at Carlee.

From Bombay, Heber sailed with his wife and daughter to Ceylon, a large portion of which he visited. He then proceeded to Calcutta. On the 30th of January 1826, shortly after his recovery from a fever, he again quitted his family for the purpose of visiting Madras and the southern provinces of India. At Madras he was received with great kindness by Sir Thomas Munro, who was warmly desirous of rendering his position as little disagreeable as the season and climate would permit. From thence he proceeded through Caddalore and Tanjore to Trichinopoly, where, on the 3d of April 1826, his pious, active, and valuable life was closed. "It were a useless," says Mrs Heber, "and a deeply painful task, to enter into any detail of the apparent cause of his death: it is sufficient to say that disease had, unsuspected, been existing for some time; and that it was the opinion of all the medical men in attendance that, under no circumstances, could his invaluable life have been very long preserved, though the event was undoubtedly hastened by the effects of climate, by intense mental application to those duties which increased in interest with every step he took, and was finally caused by the effects of cold on a frame exhausted by heat and fatigue. His mortal remains were attended to the grave with the highest honours, and followed by the tears of the inhabitants of Trichinopoly. They rest on the north side of the altar in St John's Church."—*Abridged from Lives of Celebrated Travellers.*—National Library.

ADVENTURE WITH A SNAKE.

In the course of the "Wanderings of Charles Waterton," in Demerara and the adjacent parts of South America, this enterprising traveller relates a variety of curious personal adventures in his excursions through the forests and tangled wildernesses, one of which, an encounter with a snake, may be selected for the amusement of my young readers:—

"The sun (says he) had just passed the meridian in a cloudless sky; there was scarcely a bird to be seen, for the winged inhabitants of the forest, as though overcome by heat, had retired to the thickest shades; all would have been like midnight silence were it not that the shrill voice of the pi-pi-yo every now and then resounded from a distant tree. I was sitting with a Horace in my hand, when a negro and his little dog came down the hill in haste, and I was soon informed that a snake had been discovered; but it was a young one, called the bushmaster, a rare and poisonous snake. I instantly rose up, and, laying hold of the eight-foot lance, which was close by me, 'Well then, Daddy,' said I, 'we'll go and have a look at the snake.' I was barefoot, with an old hat, and check shirt, and trousers on, and pair of braces to keep them up. The negro had his cutlass, and we ascended the hill; another negro, armed with a cutlass, joined us, judging, from our pace, that there was something to do. The little dog came along with us, and when we had got about half a mile in the forest, the negro stopped, and pointed to a fallen tree; all was still and silent; I told the negroes not to stir from the place where they were, and keep the little dog in, and that I would go in and reconnoitre. I advanced up to the place slow and cautious. The snake was well concealed, but at last I made him out; it was a coulacanara, not poisonous, but large enough to have crushed any of us to death. On measuring him afterwards, he was something more than fourteen feet long. This species of snake is very rare, and much thicker, in proportion to his length, than any other snake in the forest. A coulacanara of fourteen feet in length is as thick as a common boa of twenty-four. After skinning this snake, I could easily get my head into its mouth, as the singular formation of the jaws admits of wonderful extension. A Dutch friend of mine, by name Brouwer, killed a boa, twenty-two feet long, with a pair of stag's horns in his mouth; he had swallowed the stag, but could not get the horns down; so he had to wait in patience with that uncomfortable mouthful till his stomach digested the body, and then the horns would drop out. In this plight the Dutchman found him, as he was going in his canoe up the river, and sent a ball through his head. On ascertaining the size of the serpent which the negro had just found, I retired slowly the way I came, and promised four dollars to the negro who had shown it to me, and one to the other who had joined us. Aware that the day was on the decline and that the approach

of night would be detrimental to the dissection, a thought struck me that I could take him alive. I imagined, if I could strike him with the lance behind the head, and pin him to the ground, I might succeed in capturing him. When I told this to the negroes, they begged and intreated me to let them go for a gun, and bring more force, as they were sure the snake would kill some of us; but I had been in search of a large serpent for years, and now having come up with one, it did not become me to turn soft. So, taking a cutlass from one of the negroes, and then ranging both the sable slaves behind me, I told them to follow me, and that I would cut them down if they offered to fly. I smiled as I said this; but they shook their heads in silence, and seemed to have but a bad heart of it. When we got up to the place, the serpent had not stirred; but I could see nothing of his head, and I judged by the folds of his body that it must be at the farthest side of his den. A species of woodbine had formed a complete mantle over the branches of the fallen tree, almost impervious to the rain or the rays of the sun. Probably he had resorted to this sequestered place for a length of time, as it bore the marks of an ancient settlement. I now took my knife, determining to cut away the woodbine, and break the twigs in the gentlest manner possible, till I could get a view of his head. One negro stood guard close behind me with the lance, and near him the other with a cutlass. The cutlass which I had taken from the first negro was on the ground close by me in case of need. After working in dead silence for a quarter of an hour, with one knee all the time on the ground, I had cleared away enough to see his head. It appeared coming out betwixt the first and second coil of his body, and was flat on the ground. This was the very position I wished it to be in. I rose in silence, and retreated very slowly, making a sign to the negroes to do the same. We were at this time about twenty yards from the snake's den. I now ranged the negroes behind me, and told him who stood next to me to lay hold of the lance the moment I struck the snake, and that the other must attend my movements. It now only remained to take their cutlasses from them, for I was sure if I did not disarm them, they would be tempted to strike the snake in time of danger, and thus for ever spoil his skin. On taking their cutlasses from them, if I might judge from their physiognomy, they seemed to consider it as a most intolerable act of tyranny in me. Probably nothing kept them from bolting, but the consolation that I was to be betwixt them and the snake. Indeed my own heart, in spite of all I could do, beat quicker than usual; and I felt those sensations which one has on board a merchant vessel in war time, when the captain orders all hands on deck to prepare for action, while a strange vessel is coming down upon us under suspicious colours. We went slowly on in silence without moving our arms or heads, in order to prevent alarm as much as possible, lest the snake should glide off, or attack us in self defence. I carried the lance perpendicularly before me, with the point about a foot from the ground. The snake had not moved; and, on getting up to him, I struck him with the lance on the near side, just behind the neck, and pinned him to the ground. That moment the negro next to me seized the lance, and held it firm in its place, while I dashed head foremost into the den to grapple with the snake, and to get hold of his tail before he could do any mischief. On pinning him to the ground with the lance, he gave a tremendous loud hiss, and the little dog ran away, howling as he went. We had a sharp fray in the den, the rotten sticks flying on all sides, and each party struggling for superiority. I called out to the second negro to throw himself upon me, as I found I was not heavy enough. He did so, and the additional weight was of great service. I had now got firm hold of his tail; and after a violent struggle or two, he gave in, finding himself overpowered. This was the moment to secure him. So, while the first negro continued to hold the lance firm to the ground, and the other was helping me, I contrived to unloose my braces, and with them tied up the snake's mouth. The snake, now finding himself in an unpleasant situation, tried to better himself, and set resolutely to work, but we overpowered him. We contrived to make him twist himself round the shaft of the lance, and then prepared to convey him out of the forest. I stood at his head, and held it firm under my arm, one negro supporting the belly, and the other the tail. In this order we began to move slowly towards home, and reached it after resting ten times, for the snake was too heavy for us to support him without stopping to recruit our strength. As we proceeded onwards with him, he fought hard for freedom, but it was all in vain. The day was now too far spent to think of dissecting him. Had I killed him, a partial putrefaction would have taken place before morning. I had brought with me into the forest a strong bag, large enough to contain any animal I should want to dissect. I considered this the best mode of keeping alive wild animals when I was pressed for daylight; for the bag yielding in every direction to their efforts, they would have nothing solid or fixed to work on, and thus would be prevented from making a hole through it. I say fixed, for after the mouth of the bag was closed, the bag itself was not fastened or tied to anything, but moved about wherever the animal inside caused it to roll. After securing afresh the mouth of the coulacanara, so that he could not open it, he was forced into this bag, and left to his fate till morning. I cannot say he allowed me to have a quiet night. My hammock was in the loft just above him, and the floor betwixt us, half gone to decay, so that in parts of it no boards intervened betwixt his lodging and mine. He was very restless and fretful; and had Medusa been my wife, there could not have been more continued and disagreeable hissing in the bed chamber that night. At daybreak, I sent to borrow ten of the negroes who were cutting wood at a distance; I could have done with half that number, but judged it most prudent to have a good force, in case he should try to escape from the house when we opened the bag. However, nothing serious occurred. We united the

bag, kept him down by main force, and then I cut his throat. He bled like an ox. By six o'clock the same evening he was completely dissected."

Column for the Fancy.

JACK CAVANAGH.

Did you ever hear of Jack Cavanagh, the famous hand-fives player—the greatest and cleverest man of his day among the fancy, the envy of the town, the champion of ball playing, the right good hearty fellow, the thoughtless, the courageous, the peerless, Jack Cavanagh? Well, if you say you haven't, I shall tell you something about him. Jack flourished about fifteen years ago; and no man who ever breathed could match him at hitting a ball with his hand against a dead wall. This, some of you will perhaps say, was a strange and not a very great accomplishment; yet it forms an amusement which, when moderately pursued, gives the finest exercise for the body and the best relaxation to the mind, and is infinitely better than climbing or leaping over poles. All your real fancy men know this; so I proceed. Jack Cavanagh is described by Hazlitt, who announced his decease and wrote his eulogy, to have been a perfect miracle at the game of fives. "Whenever he touched the ball (says he), there was an end of the chase. His eye was certain, his hand fatal, his presence of mind complete. He could do what he pleased, and he always knew exactly what to do. He saw the whole game, and played it; took instant advantage of his adversary's weakness, and recovered balls, as if by magic and from sudden thought, that every one gave over for lost. He had equal power and skill, quickness and judgment. He could either outwit his antagonist by finesse, or beat him by main strength. Sometimes, when he seemed preparing to send the ball with the full swing of his arm, he would by a slight turn of his wrist drop it within an inch of the line. In general, the ball came from his hand, as if from a racket, in a straight horizontal line; so that it was in vain to attempt to overtake and stop it. As it was said of a great orator that he never was at a loss for a word, and for the properest words, so Cavanagh always could tell the degree of force necessary to be given to a ball, and the precise direction in which it should be sent. He did his work with the greatest ease; never took more pains than was necessary, and, while others were fagging themselves to death, was as cool and collected as if he had just entered the court. His style of play was as remarkable as his power of execution. He had no affectation, no trifling. He did not throw away the game to show off an attitude, or try an experiment. He was a fine, sensible, manly player, who did what he could, but that was more than any one else could even affect to do. He was the best up-hill player in the world; even when his adversary was fourteen, he would play on the same or better; and as he never flung away the game through carelessness and conceit, he never gave it up through laziness or want of heart. The only peculiarity of his play was, that he never volleyed, but let the balls top; but if they rose an inch from the ground, he never missed having them. There was not only nobody equal, but nobody second to him. It is supposed that he could give any other player half the game, or beat them with his left hand. His service was tremendous. He once played Woodward and Meredith together (two of the best players in England) in the Fives Court, St Martin Street, and made seven and twenty aces followed of services alone—a thing unheard of. Cavanagh was an Irishman by birth, and a house-painter by profession. He had once laid aside his working-dress, and walked up in his smartest clothes, to the Rosemary Branch, to have an afternoon's pleasure. A person accosted him, and asked him if he would have a game. So they agreed to play for half-a-crown a game, and a bottle of cider. The first game began—it was seven, eight, ten, thirteen, fourteen, all. Cavanagh won it. The next was the same. They played on, and each game was hardly contested. 'There,' said the unconscious fives player, 'there was a stroke that Cavanagh could not take; I never played better in my life, and yet I can't win a game. I don't know how it is.' However, they played on, Cavanagh winning every game, and the by-standers drinking the cider and laughing all the time. In the twelfth game, when Cavanagh was only four and the stranger thirteen, a person came in, and said, 'What! are you here, Cavanagh?' The words were no sooner pronounced than the astonished player let the ball drop from his hand, and saying, 'What! have I been breaking my heart all this time to beat Cavanagh?' refused to make another effort. 'And yet I give you my word,' said Cavanagh, telling the story with some triumph, 'I played all the while with my clenched fist.' He used frequently to play matches at Copenhagen House for wagers and dinners. The wall against which they play is the same that supports the kitchen chimney, and when the wall resounded louder than usual, the cooks exclaimed, 'That is the Irishman's ball,' and the joints trembled on the spit. Jack was a young fellow of sense, humour, and courage. He once had a quarrel with a waterman at Hungerford-Stairs, and Jack served him out in great style. In a word, there are hundreds at this day who cannot mention his name without admiration, as the best fives player that ever lived (the greatest excellence of which they have any notion), and the noisy shout of the ring happily stood him instead of the unheard of voice of posterity."

CAN HORSES AND DOGS SEE GHOSTS?

It is one of the "good old ideas" of the people that horses and dogs can see spirits or ghosts in the dark, when human beings can see nothing. Now, this is all nonsense. Horses and dogs have curious imaginations. They often think they see ghosts, which turn out to be no ghosts at all. An intelligent sportsman has mentioned, "that returning home in the dusk with his pointer, the dog all at once skulked behind him, and refused to advance, in spite of his master's threats. Upon looking towards the horizon before him, the sportsman descried what he at first took for a tall man, with a broad hat, extended arms, and a body as thin as a lath. This object which produced the dog's alarm, was a gigantic thistle, which the grey of the twilight had magnified into fearful dimensions." I have noticed—and it has been noticed thousands of times—that however foolishly dogs behave with regard to ghosts, they have always the sense to know a beggar or a poor man from another person. But they have a good reason for doing so. They invariably suspect that all is not right when they see any one approaching a house in a timid manner; and they often observe that beggars—that is, ill-dressed persons—are huffed away from doors and treated in a sorry way. Of course they think they may use the same indignities. Nothing will terrify a dog so much as the sight of a naked man, because this is an object he has been quite unaccustomed to. If he were to see people formed with spokes and a rim, like a cart

wheel—as the inhabitants of Saturn may be for anything I know to the contrary—he could not be more surprised. It is told that a tan-yard at Kilmarnock, in Ayrshire, was a few years ago extensively robbed by a thief, who took this method to overcome the courage of a powerful Newfoundland dog, who had long protected a considerable property. The terror which the dog felt at the naked thief was altogether imaginary; for the naked man was less capable of resisting the attack of the dog, than if he had been clothed. But then the dog had no experience to direct him, and in all probability he thought he saw a ghost.

A BIT OF SCIENCE.

It is a principle in animal mechanics, that power is exhausted fully more by the time occupied in action than by the intensity of force exerted; that is to say, the quicker that work is done, though by great exertion for the moment, it is better for the animal than if it were put to a tedious pull. Suppose two men of equal weight to ascend the same stair, one of whom takes only a minute to reach the top, and the other takes four minutes, it will cost the first but a little more than a fourth part of the fatigue, while it costs the second a great deal, because the exhaustion has relation to the time during which the muscles are acting. Again, a healthy man will run rapidly up a long stair, and his breathing will scarcely be quickened at the top; but if he walks up slowly, his legs will feel fatigued, and he will have to wait some time before he can speak calmly. Now, the moral of this is, that it is much better (as a coachman well knows from practice) that coach horses should be made to gallop up a short hill in preference to walking them, and allowing them a short rest at the top.

CAPTAIN BARCLAY.

This gentleman, in preventing the "Old English Sports" from running to decay, must be considered as the most distinguished *fancier* in the sporting world; as a thorough-bred sportsman, he stands pre-eminently high. Whether he be viewed in partaking of the diversions of the chase, or paying attention to improve the system of agriculture; or in displaying his extraordinary feats of pedestrianism; or exercising his judgment in training men to succeed in foot races and pugilistic combats, Captain Barclay decidedly takes the lead. His knowledge of the capabilities of the human frame is complete, and his researches and practical experiments to ascertain the physical powers of man would have reflected credit on our most enlightened and persevering anatomists. The sporting pursuits of Captain Barclay are completely scientific, and his plans so well matured, that his judgment generally proves successful.

Robert Barclay Allardie, Esq. of Ury, succeeded his father in the eighteenth year of his age. He was born in August 1779, and, at eight years of age, was sent to England to receive his education. He remained four years at Richmond school, and three years at Brixton Causeway. His academical studies were completed at Cambridge.

The Captain's favourite pursuits have ever been the art of agriculture as the serious business of his life, and the manly sports as his amusement. The improvement of his estates has occupied much of his attention, and, by pursuing the plan adopted by his immediate predecessor, the value of his property has been greatly augmented. His love of athletic exercises may proceed from the strong conformation of his body, and great muscular strength. His usual rate of travelling on foot is six miles an hour, and to walk from twenty to thirty miles before breakfast is a favourite amusement. His style of walking is to bend forward the body and throw its weight on the knees. His step is short, and his feet are raised only a few inches from the ground. Any person trying this plan will find his pace quickened, that he will walk with more ease to himself, and be better able to endure the fatigue of a long journey, than by walking perfectly erect, which throws too much of the weight of the body on the ankle-joints. He always uses thick-soled shoes and lambs' wool stockings, which preserve the feet from injury. In his arms, the Captain possesses uncommon strength. In April 1806, while in Suffolk with the 23d regiment, he offered a bet of one thousand guineas that he would lift from the ground the weight of half a ton. He tried the experiment, and lifted twenty-one half hundred weights. He afterwards, with a straight arm, threw a half hundred weight the distance of eight yards, and over his head the same weight a distance of five yards.

The following list contains the most prominent public and private pedestrian exploits performed by Captain Barclay.

The Captain, when only 17 years of age, entered into a match with a gentleman in London, in the month of August 1796, to walk six miles within an hour, fair toe and heel, for 140 guineas, which he accomplished on the Croydon road.

In 1798, he performed the distance of 70 miles in 14 hours, beating Ferguson, the celebrated walking clerk, by several miles.

In December 1799, he accomplished 150 miles in two days, having walked from Fenchurch Street, in London, to Birmingham, round by Cambridge.

The Captain walked 64 miles in 12 hours, including the time for refreshment, in November 1800, as a sort of preparatory trial to a match of walking 90 miles in 2½ hours, for a bet of 500 guineas with Mr Fletcher of Ballingshoe. In training, the Captain caught cold, and gave up the bet. In 1801, he renewed the above match for 2000 guineas. He accomplished 67 miles in 13 hours, but having drank some brandy, he became instantly sick, and unable to proceed. He consequently gave up the bet, and the umpire retired; but, after two hours' rest, he was so far recovered, that he had time enough left to have performed his task.

Captain Barclay felt so confident that he could walk 90 miles in 2½ hours, that he again matched himself for 5000 guineas. In his training to perform this feat, he went one hundred and ten miles in nineteen hours, notwithstanding it rained nearly the whole of the time. This performance may be deemed the greatest on record, being at the rate of upwards of 135 miles in 24 hours.

On the 14th November 1801, he started to perform the above match, between York and Hull. The space of ground was a measured mile; and on each side of the road a number of lamps were placed. The Captain was dressed in a flannel shirt, flannel trousers, and night-cap, lambs' wool stockings, and thick-soled leather shoes. He proceeded till he had gone 70 miles, scarcely varying in regularly performing each round of two miles in 25 minutes, taking refreshment at different periods. The Captain commenced at 12 o'clock at night, and performed the whole distance by 22 minutes 4 seconds past eight o'clock on Tuesday

evening, being one hour, seven minutes, and fifty-six seconds within the specified time. He could have continued for several hours longer, if necessary.

In December, the Captain did 100 miles in 19 hours, over the worst road in the kingdom. Exclusive of stoppages, the distance was performed in 17 hours and a half, or at the rate of about five miles and three quarters each hour on the average.

As an additional instance of the Captain's strength, he performed a most laborious undertaking, merely for his amusement, in August 1806. Having gone to Colonel Murray Farquharson's house in Aberdeenshire, he went out at five in the morning to enjoy the sport of grouse shooting, where he travelled at least 30 miles. He returned to the Colonel's house by five in the afternoon, and after dinner set off for Ury, a distance of 69 miles, which he walked in 11 hours, without stopping once to refresh. He attended to his ordinary business at home, and in the afternoon walked to Laurencekirk, 16 miles, where he danced at a ball during the night, and returned to Ury by seven in the morning. He did not yet return to bed, but occupied the day in partridge-shooting. He had thus travelled not less than 130 miles, supposing him to have gone only eight miles in the course of the day's shooting at home, and also danced at Laurencekirk, without sleeping, or having been in a bed for two nights and nearly three days.

In October 1808, Captain Barclay made a match with Mr Webster, a gentleman of great celebrity in the sporting world; by which Captain Barclay engaged himself to go, on foot, a thousand miles in a thousand successive hours, at the rate of a mile in each and every hour, for a bet of one thousand guineas, to be performed at Newmarket-beath, and to start on the following first of June. In the intermediate time, the Captain was in training by Mr Smith, of Owston, in Yorkshire. To enter into a detail of this matchless performance would be tiresome to our readers; suffice to say, he started at twelve o'clock at night on Thursday, the 1st of June, in good health and high spirits. His dress from the commencement varied with the weather. Sometimes he wore a flannel jacket, sometimes a loose grey coat, with strong shoes, and two pair of coarse stockings, the outer pair boot-stocks, without feet, to keep his legs dry. He walked in a sort of lounging gait, without any apparent extraordinary exertion, scarcely raising his feet two inches above the ground. During a great part of the time the weather was very rainy, but he felt no inconvenience from it; indeed, wet weather was favourable to his exertions; as, during dry weather, he found it necessary to have a water-cart to go over the ground to keep it cool, and prevent it becoming too hard. Towards the conclusion of the performance, it was said, the Captain suffered much from the spasmodic affection of his legs, so that he could not walk a mile in less than twenty minutes; he, however, ate and drank well, and bets were two to one and five to two in his completing his journey within the time prescribed. About eight days before he finished, the sinews of his right leg became much better, and he continued to pursue his task in high spirits, and consequently bets were ten to one in his favour, in London, at Tattersall's, and other sporting circles.

On Wednesday, July the 12th, Captain Barclay completed his arduous undertaking. He had till four p.m. to finish his task, but he performed the last mile by a quarter of an hour after three in perfect ease and great spirit, amidst an immense crowd of spectators. The influx of company had so much increased on Sunday, it was recommended that the ground should be roped in. To this, however, Captain Barclay objected, saying that he did not like such parade. The crowd, however, became so great on Monday, and he had experienced so much interruption, that he was prevailed upon to allow this precaution to be taken. For the last two days he appeared in higher spirits, and performed his last mile with apparently more ease, and in a shorter time than he had done for some days past.

With the change of weather he had thrown off his loose great coat, which he wore during the rainy period, and walked in a flannel jacket. He also put on shoes thicker than any which he had used in any previous part of his performance. When asked how he meant to act after he had finished his feat, he said he should that night take a good sound sleep, but that he must have himself awaked twice or thrice in the night to avoid the danger of a too sudden transition from almost constant exertion to a state of long repose. One hundred guineas to one, and, indeed, any odds whatever, were offered on Wednesday morning; but so strong was the confidence in his success, that no bets could be obtained. The multitude who resorted to the scene of action, in the course of the concluding days, was unprecedented. Not a bed could be procured on Tuesday night at Newmarket, Cambridge, Bury, or any of the towns or villages in the vicinity, and every horse and vehicle were engaged. Among the nobility and gentry who witnessed the conclusion of this extraordinary performance, were the Dukes of Argyll and St Alban's; Earls Grosvenor, Besborough, and Jersey; Lords Foley and Somerville; Sir John Lade, Sir F. Standish, &c. &c. The aggregate of the bets is supposed to have amounted to £100,000. Upon the whole, Captain Barclay must be viewed as a most extraordinary man, and shows the extent of vigour that the human frame derives from exercise.—Pierce Egan.

A LARGE ROYAL FAMILY.

At Sir Gore Ouseley's audience of leave, he begged the Shah of Persia graciously to tell him what was the number of his children, that he might give his own monarch correct information on so interesting a subject, provided, as was probable, he should make inquiry. "A hundred and fifty-four sons," replied the Shah. "May I venture to ask your Majesty how many children?" The word daughters, according to the rules of oriental etiquette, he dared not to pronounce, and, indeed, the general question was, according to Persian notions, almost an offence. The King, however, who liked Sir Gore very much, did not take it ill. "Ha, ha! I understand you, said he laughing, and called to the chief of his eunuchs, "Musa, how many daughters have I?" "King of Kings," answered Musa, prostrating himself on his face, "five hundred and sixty." When Sir Gore Ouseley repeated this conversation to the Empress Mother in St Petersburg, she only exclaimed, "Ah, le monstre"—*Travels of a German Prince.*

THE HOLY LAND.

In proceeding from Jerusalem to the banks of the Jordan, I travelled in one part through a rocky and perilous defile, and came to a frightful desert of hills, tossed as it were and jumbled together in the wildest confusion by some violent agitation of nature. On one of these, which is of great altitude, or, in the language of the Evangelist, "an exceeding high mountain," it is said our Saviour, after being baptized in Jordan, was led and tempted by the devil. There are various caverns or cells dug in the sides of horrible precipices, the abodes of the religious, who inhabited them, but particularly during the period of Lent, after the example of our Lord's rigorous fasting in the wilderness, wherein he sets us a glorious example of triumphing over the vanities of this world, and the most powerful temptations of hell. The utter wildness, awful silence, and bleak sterility of this extensive wilderness, where no house of any description, nor so much as a single tree, was visible to afford shelter from the scorching beams of a meridian sun, or the note of a bird is heard, caused me to sympathise in the wish of the Prophet, that I might find some place of refuge. Never did I behold a spot of earth more secluded, or better suited for the votaries of abstinence, or to form the abode of such anchorites as Peter the Hermit, or Simon the Misanthrope. It was impossible to behold these caverns without being forcibly reminded of that interesting detail given by the great Apostle of those unparalleled sufferings endured by the early Christians who had set their seals to the word of God, which is the testimony of Jesus, and who, in a state of destitution, were forced to wander in deserts, and to hide themselves from their sanguinary persecutors, in dens which in all probability might have been those identical caves I was now visiting, and who had before their eyes the example of their Lord himself, who despised the shame of enduring the cross. Indeed, after such vengeance had been visited by the Jews on the Messiah, it was not to be supposed that the least mercy would be extended to those who followed his blessed steps. Whatever opinion, however, we may entertain of that spirit of persecution which had been directed towards the little flock, we must at the same time contemplate with astonishment the exact fulfilment of their divine teacher. Notwithstanding these persecutions, eternal thanks to the Almighty, the word of God mightily prevailed, the cross of Christ was triumphant, and his prophecy of the growth of the church is ranked among his remarkable predictions.—*Rae Wilson's Travels in the Holy Land.*

BOUNDLESSNESS OF THE CREATION.

About the time of the invention of the telescope, another instrument was formed, which laid open a scene no less wonderful, and rewarded the inquisitive spirit of man. This was the microscope. The one led me to see a system in every star; the other leads me to see a world in every atom. The one taught me that this mighty globe, with the whole burden of its people and its countries, is but a grain of sand on the high field of immensity; the other teaches me that every grain of sand may harbour within it the tribes and the families of a busy population. The one told me of the insignificance of the world I tread upon; the other redeems it from all its insignificance; for it tells me, that in the leaves of every forest, and in the flowers of every garden, and in the waters of every rivulet, there are worlds teeming with life, and numberless as are the glories of the firmament. The one has suggested to me, that beyond and above all that is visible to man, there may be fields of creation which sweep immeasurably along, and carry the impress of the Almighty's hand to the remotest scenes of the universe; the other suggests to me, that within and beneath all that minuteness which the aided eye of man has been able to explore, there may be a region of invisibles; and that could we draw aside the mysterious curtain which shrouds it from our senses, we might see a theatre of as many wonders as astronomy has unfolded, a universe within the compass of a point so small as to elude all the powers of the microscope, but where the wonder-working God finds room for the exercise of all his attributes, where he can raise another mechanism of worlds, and fill and animate them all with the evidence of his glory.—*Chalmers.*

SILVER HORSE-SHOES.

It is mentioned by Beckmann, that when the Marquis of Tuscany, one of the richest princes of his time, went to meet Beatrix his bride, about the year 1098, his whole train were so magnificently decorated, that his horses were shod, not with iron, but with silver. The nails even were of the same metal; and, when any of them dropped out, they belonged to those who found them. It is well known that an ambassador from England to France once indulged in a similar extravagance, to exhibit his opulence and generosity; having had his horse shod with silver shoes so slightly attached, that, by purposely curvetting the animal, they were shaken off, and allowed to be picked up by the populace.

MINUTE BEASTS OF PREY—HYDRACHNÆ.

The minute beings now under consideration occur abundantly in stagnant or slowly moving waters. The spring season is the most favourable for the observance of their habits. They run through the water with great rapidity, with a continual movement of their legs. Their dispositions are carnivorous, and their food consists of animalcular species, of minute insects, small flies, and aquatic larvae. Müller kept many Hydrachnæ in vessels of water full of *animalcula infusoria*, millions of which were eaten in a few days, soon after which the Hydrachnæ were found in a state of great languor, and transparent from exhaustion. They speedily revived when a few drops of water containing animalcules were mingled with that through which they swam.—*Encyc. Brit. new edit.*

COBBETT ON MILK.

As to the pretended *unwholesomeness* of milk in certain cases, as to its not being adapted to some *constitutions*, I do not believe one word of the matter. When we talk of the *fruits*, indeed, which were formerly the chief food of a great part of mankind, we should recollect that those fruits grew in countries that had a *sun to ripen* the fruits, and to put nutritious matter into them. But, as to *milk*, England yields to no country upon the face of the earth. Neat cattle will touch nothing that is not wholesome in its nature; nothing that is not wholly innocuous. Out of a pail that has ever had grease in it they will not drink a drop, though they be raging with thirst. Their very breath is fragrance. And how, then, is it possible that unwholesomeness should distil from the udder of a cow? The milk varies, indeed, in its quality and taste, according to the variations in the nature of the food; but no food will a cow touch that is any way hostile to health. Feed young puppies upon *milk from the cow*, and they will never die of that ravaging disease called "*the distemper*." In short, to suppose that milk contains any thing essentially unwholesome, is monstrous. When, indeed, the appetite becomes vitiated; when the organs have been long accustomed to food of a more stimulating nature; when it has been resolved to eat ragouts at dinner, and drink wine, and to swallow "*a devil*" and a glass of strong grog at night; then milk for breakfast may be "*heavy*" and disgusting, and the feeder may stand in need of tea or laudanum, which differ only as to degrees of strength. But, and I speak from the most ample experience, milk is not "*heavy*," and much less is it *unwholesome*, when he who uses it rises early, never swallows strong drink, and never *stuffs* himself with flesh of any kind. Many and many a day I scarcely taste of meat, and then chiefly at breakfast, and that, too, at an earlier hour. Milk is the natural food of *young people*; if it be too rich, *skim* it again and again till it be not too rich. This is an evil easily cured. If you have now to *begin* with a family of children, they may not like it at first. But, *persevere*; and the parent who does not do this, having the means in his hands, shamefully neglects his duty. A son who prefers a "*devil*" and a glass of grog to a haunch of bread and a bowl of cold milk, I regard as a pest; and for this pest the father has to thank himself. —Cobbett's Cottage Economy.

CHAMBERS'S EDINBURGH JOURNAL.

This work was commenced on the 4th of February last; and in ten weeks from that date, its success has been such as to astonish even the most sanguine persons connected with it. The sale, which at the first reached about fifteen thousand copies, has now increased so much, that of No. XI. *thirty-one thousand* were printed, of which five-sixths immediately disappeared from the shop of the publishers to answer the demands of the regular purchasers. What is most wonderful of all, not above three thousand of this vast quantity of copies go out of Scotland, while even in that country there are many large districts in which, from various circumstances, the work has never yet appeared. The confined range of the publication has been owing, partly to the difficulty of transmitting so bulky an article to a distance; partly to the difficulty of getting the printers employed to execute reprints of the early numbers in time; but, most of all, to the difficulty of procuring proper agents for the management of a publication so entirely out of the usual scope of the trade. The publishers have particularly to regret that they were unable for so many weeks to give the work a fair chance in London, and throughout England. They have now, however, the satisfaction of announcing, that their agent in London, Mr W. S. Orr of Paternoster Row, has deemed the work worthy of being reprinted in that city, at his own risk, for the purpose of being brought fully into circulation through all parts of England, Wales, and Ireland. By this arrangement, which has been rendered quite agreeable to the publishers, and which takes effect from the present number, it is considered not unlikely that the impression will soon amount to the better part of a hundred thousand copies!*

The Editor has just been favoured with the following copy of an advertisement which appeared in the New York papers of the middle of last month:—"Three brothers, well known to the reading people in Scotland, have lately commenced a weekly publication under the title of 'Chambers' Edinburgh Journal.' It contains original papers by two of the brothers, which we deem worthy of being preserved; and we, therefore, propose to republish them by subscription, as they shall reach us. Those by Mr William Chambers we shall designate 'Ethics'; those by Robert 'Satires'; and as they will appear separately, they may be separately subscribed for. Subscription papers lie at Mr Pennefeather's, the Three Bibles, in History Row." While

At this great stage in the history of the Journal, it is considered proper to explain anew the principles upon which it is conducted. It may be most readily described as a weekly magazine, at the least possible price. The articles are partly original, consisting of tales, sketches of society (chiefly of the middle ranks of life), and matters of solid and useful information. Another part of the work consists of extracts from new or old books, not apt to be in the hands of general readers; and here the united principles of information and amusement are also adopted. Mr Chambers would be happy, for his own part, to make the work exclusively of a useful cast, but he fears that what might be added to its solidity would detract from its circulation, and, consequently, lessen its real usefulness. He conceives that so long as good taste is not offended, the frivolous matters of lighter literature serve the same good end as the wings attached to certain seeds, by which they are carried away and diffused over the earth. The reader may be led through the portico of a droll anecdote into the solemn temple of religion, or the groves of the academy. The work is calculated for all classes of society; but the conductor at the same time may mention that he contemplates, in a particular manner, the interests of the Young, and of the Poor; two classes towards whose improvement the greatest men of the present age have been proud to direct their efforts. In order to attain perfect universality of appreciation, the work never trenches upon either religious or political prepossessions.

Mr Chambers has learned that London at the present time abounds in periodicals equally cheap with the present, or even more so, but in many cases reprehensible, as circulating matter of a kind not calculated to improve their readers, and also as infringing upon the privileges of the newspapers. The legislature having thought fit to oblige newspapers to purchase the prerogative of publishing intelligence of "passing occurrences of the day" at a heavy price, any attempt to convey news without buying that prerogative is exactly the same injurious offence as smuggling. The conductors of this Journal call upon the proprietors of newspapers to observe that it contains *no news*—that, in reality, it *cannot* do so, as, from the extent of the impression, it is prepared and made up generally ten days, and sometimes even a fortnight, before it comes out. It must be obvious to them, from a cursory glance at the pages of the Journal, that it has less reference to time than even many works of a respectable nature which have been published for a long series of years without stamps. Allusion is here made to the class of works which profess to give a weekly report of the progress of literature, science, and art; which review books immediately on publication, or even before it; give notices of the plays performed during the week at the theatres, and chronicle the transactions of learned societies. The Journal does not take advantage of even this grace of the legislature; and it may therefore be said, that, if its extensive circulation should excite the hostility, instead of the friendship of the newspaper press, it does so, not by its demerits, but by something akin to the reverse.

Another distinguishing characteristic of the Journal should be mentioned. Its pages are not filled with advertisements—a species of material which, however profitable it may be, the conductor and publishers are by no means anxious to avail themselves of, and which, with the utmost good will, they leave to the proprietors of stamped sheets.

For the amusement of the general reader, and at the same time to convince the booksellers and news-venders in England of its aptitude for extensive circulation, the publishers will now state a few particulars as to the sale of the work in the different places where it has as yet been tried. In the first place, 10,000 copies are absorbed in Edinburgh and Leith, or within two miles of the spot where the work is published. Of these, 1500 are distributed every Saturday morning by the publishers among as many subscribers throughout the city, chiefly of the higher orders. About a third of the whole 10,000 are sold in the Old Town: a fact which the publishers mention with much pleasure, as it shows the extent to which the

the Editor cannot help feeling some pride in this mark of the extensive utility of his labours, he must inform Mr Pennefeather that, in his segregation of the different articles, he seems likely to make a grievous mistake. The contributions, for which he has been indebted to his younger brother, are both of a grave and a humorous character; and so, he must say, are his own compositions.

work is appreciated by the industrious classes of the community. They may also mention, as a curious fact, that the booksellers of a single street in the New Town, not more than a hundred and fifty yards in length, sell every Saturday 1000. They have further pleasure in mentioning, that the sale of the work has been favourably received in villages near Edinburgh, where, perhaps, nothing of a literary nature was ever sold before, except the most ordinary books of religious instruction. In Glasgow, the sale of the Journal is now about 4000; in Perth, it is 1400; in Aberdeen, 1200; in Dundee, 1400; in Dumfries (which completes the circle of the principal towns), 1000. Even in the smaller towns of Scotland, the sale is astonishingly great. Dunfermline sells 400; Inverness, 200; Stirling, 300; Arbroath, 200; Kirkcaldy, 200; Dunbar, 100; Haddington, 200; Lanark, 100; Hawick, 108; Elgin, 130; Paisley, 300; Greenock, 200; Selkirk, 100; Kelso, 100; Jedburgh, 102; Montrose, 380; Cupar, 260; Falkirk, 337; Linlithgow, 183; Galashiels, 132. The last case is somewhat remarkable, as the sale is there the greatest in proportion to the population of any town in the country. In almost all the other towns and villages of Scotland, the work is sold to a greater or less extent. In Newcastle, Shields, Sunderland, Carlisle, and other towns in the north of England, upwards of 2000 are circulated. Berwick-upon-Tweed takes 130. The publishers have to regret, that, owing to the high charges of the Highland coaches, they have been considerably balked in their endeavours to diffuse it in that quarter of the country, where it is perhaps most required. It is, however, established in Inverness and Dingwall, where a small additional charge is necessarily made, in order to defray the expense of carriage. The publishers also entertain hopes of being able very speedily to establish it in Kirkwall and Lerwick, the capitals of the Orkney and Shetland Islands, so that such instruction as is to be derived from these cheap columns may be diffused even to the remotest parts of the British empire. It may likewise be explained, that in all the considerable places throughout Scotland, and England, the Journal is published on one day—that of its date; so that the work is more simultaneously in the hands of its readers than any newspaper.

One word in conclusion as to the price of this paper, which at first sight is apt to have a depreciatory effect. The publishers have no hesitation in acknowledging that to sell their production at three-half-pence, is less dignified than to sell it at sixpence, eight-pence, or a shilling; which prices are perhaps more appropriate to such a quantity of literary matter. But they beg leave to point out, that, if it were not for the smallness of the price, the sale would not be so great, nor the enterprise itself so onerous and important. Even if the splendid moral aims and prospects of the paper were not what they are, the meanness of the price of an individual copy must be lost in the consideration that, for the whole impression now used in Scotland alone, the public pays upwards of ten thousand pounds a-year, of which one thousand, as duty on paper, goes into the government treasury, being as much as is paid by many newspapers for their stamps and advertisement duty. But the real dignity of the work lies in this fact; that already from one to two hundred thousand persons, chiefly of those orders to whom knowledge has as yet been most inaccessible, must be hebdomadally receiving an accession of new ideas, besides, it is to be hoped, some moral, and occasionally a little religious edification, from its columns. There may be something in the numismatic aristocracy above alluded to; sixpence may perhaps be entitled to look down a little upon its quarter cousin three-half-pence, but the distinction of instructing thousands, and hundreds of thousands, for the hundreds of others, is a greater distinction still; and, possessing the one, the conductor and publishers may be patient, perhaps, under the want of the other.

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place. Sold also by JAMES CHAMBERS, 48, North Hanover Street, and by all other Booksellers in Edinburgh and every other Town in Scotland.

Subscribers in Town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In LONDON, an Edition is published, with the permission of the Proprietors, by W. S. ORR, Paternoster-row, for circulation throughout England, Wales, and Ireland.

Stereotyped by ALEX. KIRKWOOD, North St Andrew Street, And printed by W. RITCHIE, & Co. Edinburgh.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM CHAMBERS, AUTHOR OF THE "BOOK OF SCOTLAND," "GAZETTEER OF SCOTLAND," &c.

No. 14.

SATURDAY, MAY 5, 1832.

PRICE THREE HALFPENCE.

TALE OF THE SILVER HEART.

In the course of a ramble through the western part of Fife, I descended one evening upon the ancient burgh of Culross, which is situated on a low stripe of land beside the sea-shore, with a line of high grounds rising behind it, upon which are situated the old abbey church and the ruins of a very fine mansion-house, once the residence of the lords of the manor. On stepping forth next morning from the little inn, I found that the night had been stormy, and that the waves of the Forth were still rolling with considerable violence, so as to delay the usual passage of the ferry-boat to Borrowstouness. Having resolved to cross to that part of the opposite shore, I found that I should have ample time, before the boat could proceed, to inspect those remains of antiquity, which now give the burgh almost its only importance in the eyes of a traveller. The state of the atmosphere was in the highest degree calculated to increase the interest of these objects. It was a day of gloom, scarcely different from night. The sky displayed that fixed dullness which so often succeeds a nocturnal tempest; the sea was one sheet of turbid darkness, save where chequered by the breaking wave. The streets and paths of the little village-burgh showed, each by its deep and pebbly seam, how much rain had fallen during the night; and all the foliage of the gardens and woods around, as well as the walls of the houses, were still drenched with wet. Having secured the services of the official called the *bedral*, I was conducted to the abbey church, which is a very old Gothic structure, but recently repaired and fitted up as a parochial place of worship. It was fitting, in such a gloomy day, to inspect the outlines of abbots and crusaders which still deck the pavement of this ancient temple; and there was matter, perhaps, for still more solemn reflection in the view of the adjacent mansion-house. Culross Abbey, as this structure is called, was finished so lately as the reign of Charles II., and by the same architect with Holyrood-house, which it far exceeded in magnificence. Yet, as the premature ruin of youthful health is a more affecting object than the ripe decline of age, so did this roofless modern palace, with the wall-flower waving from its elegant Grecian windows, present a more dismal aspect than could have been expected from any ruin of more hoary antiquity. The tale which it told of the extinction of modern grandeur, and the decline of recently flourishing families, appealed more immediately and more powerfully to the sympathies than that of remote and more barbarous greatness, which is to be read in the sterner battlements of a border tower, or an ancient national fortress. The site had been chosen upon a lofty terrace overlooking the sea, in order that the inmates might be enlivened by the ever-changing aspect of that element, and the constant transit of its ships; but now all useless was this peculiarity of situation except to serve to the mariner as a kind of landmark, or to supply the more contemplative voyager with the subject of a sigh. With a mind attuned by this object to the most melancholy reflections, I was conducted to what is called an aisle or burial vault, projecting from the north side of the church, and which contains the remains of the former lords of Culross. There images are shown, cut in beautiful Italian marble, of Sir — Bruce, his lady, and several children, all of which must have been procured from the Continent, at a great expense; for this honourable knight and his family flourished in the early part of the seventeenth century, when no such

art was practised in Scotland. The images, however, and the whole sepulchre, had a neglected and desolate appearance, as may be expected by the greatest of personages, when their race has become unknown at the scene of their repose. In this gloomy chamber of the heirless dead, I was shown a projection from one of the side-walls, much like an altar, over which was painted on the wall the mournfully appropriate and expressive word "FUIMUS." Below was an inscription on a brass plate, importing that this was the resting-place of the heart of Edward Lord Bruce of Kinloss, formerly proprietor of the princely estate of Culross; and that the story connected with it was to be found related in the *Guardian*, and alluded to in Clarendon's History of the Great Rebellion. It was stated that the heart was enclosed in a silver case of its own shape, which had reposed here ever since it ceased to beat with the tide of mortal life in the year 1613, except that it was raised from its cell for a brief space in 1808, in the course of some repairs upon the sepulchre. As I had a perfect recollection of the story told by Steele, which, indeed, had made a deep impression upon me in boyhood, it was with no small interest that I beheld the final abode of an object so immediately connected with it. It seemed as if time had been betrayed, and two centuries annihilated, when I thus found myself in presence of the actual membrane, in bodily substance entire, which had, by its proud passions, brought about the catastrophe of that piteous tale. What! thought I, and does the heart of Edward Bruce, which beat so long ago with emotions now hardly known among men, still exist at this spot, as if the friends of its owner had resolved that so noble a thing should never find decay? The idea had in it something so truly captivating, that it was long ere I could quit the place, or return to the feelings of immediate existence. The whole scene around, and the little neglected burgh itself, had now become invested with a fascinating power over me; and I did not depart till I had gathered, from the traditions of the inhabitants, the principal materials of the following story, aiding them, after I had reached home, by reference to more authentic documents:—

Edward Lord Bruce of Kinloss, the second who bore the title, was the son of the first Lord, who is so memorable in history as a serviceable minister to King James VI. during the latter years of his Scottish reign, having been chiefly instrumental, along with the Earl of Mar, in smoothing the way for his Majesty's succession to Queen Elizabeth. After the death of his father, the young Lord Bruce continued, along with his mother, to enjoy high consideration in the English court. He was a contemporary and playmate of Henry, Prince of Wales, whom he almost equalled in the performance of all noble sports and exercises, while, from his less cold character, he was perhaps a greater favourite among those who were not prepossessed in favour of youthful royalty. There was not, perhaps, in the whole of the English court, any young person of greater promise, or more endearing qualities, than Lord Bruce, though, in respect of mere external accomplishments, he was certainly rivalled by his friend, Sir George Sackville, a younger son of the Earl of Dorset. This young gentleman, who was the grandson of one poet,* and destined to be the grandsire of another,† was one of those free and dashing spirits,

who, according to the accounts of contemporary writers, kept the streets of London in an almost perpetual brawl, by night and day, with their extravagant frolics, or, more generally, the feuds arising out of them. His heart and genius were naturally good, but the influence of less innocent companions gradually betrayed him into evil habits; and thus many generous faculties, which might have adorned the highest profession, were in him perverted to the basest uses. It was often a subject of wonder that the pure and elevated nature of young Lord Bruce should tolerate the reckless profligacy of Sackville; but those who were surprised did not take a very extended view of human nature. The truth is, that real goodness is often imposed upon by vice, and sees in it more to attract and delight than it does in goodness similar to itself. The gentle character of Bruce clung to the fierce and turbulent nature of Sackville, as if it found in that nature a protection and comfort which it needed. Perhaps there was something, also, in the early date of their intimacy, which might tend to fix the friendship of these dissimilar minds. From their earliest boyhood, they had been thrown together as pages in the household of the prince, where their education proceeded, step by step, in union, and every action and every duty was the same. It was further remarked, that, while the character of Bruce appeared always to be bolder in the presence of Sackville than on other occasions, that of Sackville was invariably softened by juxtaposition with Bruce; so that they had something more like a common ground to meet upon than could previously have been suspected.

When the two young men were about fourteen, and as yet displayed little more than the common features of innocent boyhood, Sackville was permitted by his parents to accompany Bruce on a summer visit to the paternal estates of the young nobleman in Scotland. There they enjoyed together, for some weeks, all the sports of the season and place, which seemed to be as untiring as their own mutual friendship. One day, as they were preparing to go out a-hunting, an aged woman, who exercised the trade of *spawwife*, or fortune-teller, came up to the gate. The horses upon which they had just mounted were startled by the uncouth appearance of the stranger, and that ridden by Sackville was so very restive as nearly to throw him off. This caused the young Englishman to address her in language of not the most respectful kind; nor could all the efforts of Lord Bruce, who was actuated by different feelings, prevent him from aiming at her once or twice with his whip.

"For heaven's sake, Sackville," said Lord Bruce, "take care lest she make us all repent of this. Don't you see that she is a spawwife?"

"What care I for your spawwives?" cried Sackville. "All I know is, that she is a cursed old beggar or gipsy, and has nearly caused me break my neck."

"I tell you she is a witch and a fortune-teller," said his gentler companion; "and there is not a man in the country but would rather have his neck broken than say any thing to offend her."

The woman, who had hitherto stood with a face beaming with indignation, now broke out—

"Ride on to your hunting, young man," addressing Sackville; "you will not have the better sport for abusing the helpless infirmities of old age. Some day you two will go out to a different kind of sport, and one only will come back alive; alive, but wishing that he rather had been doomed to the fate of his companion."

* Lord Buckhurst.

† The Earl of Dorset, a poetical ornament of the court of Charles II.

Both Sackville and Bruce were for the time deeply impressed with this denunciation, to which the superstitious feelings of the age gave greater weight than can now be imagined; and even while they mutually swore that hostility between them was impossible, they each secretly wished that the doom could be unsaid. Its chief immediate effect was to deepen and strengthen their friendship. Each seemed to wish, by bestowing more and more affection upon his companion, at once to give to himself a better assurance of his own indisposition to quarrel, and to his friend a stronger reason for banishing the painful impression from his mind. Perhaps this was one reason—and one not the less strong that it was in some measure unconscious—why, on the separation of their characters in ripening manhood, they still clung to each other with such devoted attachment.

In process of time, a new and more tender relation arose between these two young men, to give them mutually better assurance against the doom which had been pronounced upon them. Lady Clementina Sackville, eldest daughter of the Earl of Dorset, was just two years younger than Sir George and his friend, and there was not a more beautiful or accomplished gentlewoman in the court of Queen Anne. Whether in the walking of a minuet, or in the personation of a divine beauty in one of Ben Jonson's court masques, Lady Clementina was alike distinguished; while her manners, so far from betraying that pride which so often attends the triumphs of united beauty and talent, were of the most unassuming and amiable character. It was not possible that two such natures as those of Lord Bruce and Lady Clementina Sackville should be frequently in communion, as was their case, without contracting a mutual affection of the strongest kind. Accordingly, it soon became understood that the only obstacle to their union was their extreme youth, which rendered it proper that they should wait for one or two years, before their fortunes, like their hearts, should be made one. It unfortunately happened that this was the very time when the habits of Sir George Sackville made their greatest decline, and when, consequently, it was most difficult for Bruce to maintain the friendship which hitherto subsisted between them. The household of Lord Dorset was one of that sober cast, which, in the next age, was characterised by the epithet puritanical. As such, of course, it suited with the temper of Lord Bruce, who, though not educated in Scotland, had been impressed by his mother with the grave sentiments and habits of his native country. Often then did he mourn with the amiable family of Dorset over the errors of his friend; and many was the night which he spent innocently in that peaceful circle, while Sir George roamed about, in company with the most wicked and wayward spirits of the time.

One night, after he had enjoyed with Lady Clementina a long and delightful conversation respecting their united prospects, Sir George came home in a state of high intoxication and excitement, exclaiming loudly against a Scotch gentleman with whom he had had a street quarrel, and who had been rescued, as he said, from his sword, only by the unfair interference of some other "beggarly Scots." It was impossible for a Scotsman of Bruce's years to hear his countrymen spoken of in this way without anger; but he repressed every emotion, till his friend proceeded to generalize upon the character of these "beggarly Scots," and extended his obloquy from the individuals to the nation. Lord Bruce then gently repelled his insinuations, and said, that surely there was one person at least whom he would exempt from the charge brought against his country. "I will make no exemptions," said the infuriated Sackville, "and least of all in favour of a cullion who sits in his friend's house, and talks of him puritanically behind his back." Bruce felt very bitterly the injustice of this reproach; but the difficulty of shaping a vindication rendered his answer more passionate than he wished; and it was immediately replied to by Sackville, with a contemptuous blow upon the face. There, in a moment, fell the friendship of years, and deadly gall usurped the place where nothing before had been but "the milk of kindness." Lady Clementina, to whom the whole affair seemed a freak of a hurried and unnatural dream, was shocked beyond measure by the violence of her brother; but she was partly consoled by the demeanour of Bruce, who had the address entirely to disguise his feelings in her presence, and to seem as if he looked upon the insult as only a frolic. But though he appeared quite cool, the blow and words of Sackville had sunk deep into his soul, and after brooding over the event for a few hours, he found that his very nature had become, as it were, changed. That bitterest of pains—the pain of an unrequited blow—possessed and tortured his breast; nor was the reflection that the injurer was his friend, and not at the time under the control of reason, of much avail in allaying his misery. Strange though it be, the unkindness of a friend is the most sensibly felt and most promptly resented, and we are never so near becoming the irreconcilable enemies of any fellow-creature, as at the moment when we are interchanging with him the most earnest and confiding affection. Similar feelings possessed Sackville, who had really felt of late some resentment at Lord Bruce, on account of certain references which had been made by his parents to the regret expressed by this young nobleman respecting his present course of life. To apologise for his rudeness was not to be thought of; and, accordingly, these two hearts, which for years had beat in unison, became parted at once, like rocks split by one of the convulsions of nature, and a yawning and impassable gulf was left between

For some weeks after, the young men never met; Sackville took care never to intrude into the family circle, and Bruce did not seek his company. It appeared as if the unfortunate incident had been forgotten by the parties themselves, and totally unknown to the world. One day, however, Bruce was met in Paul's Walk by a young friend and countryman, of the name of Crawford, a rambling slip of Scottish nobility, whose very sword seemed, from the loose easy way in which it was disposed by his side, to have a particular aptitude for starting up in a quarrel. After some miscellaneous conversation, Crawford expressed his regret at a story which had lately come to his ears, respecting a disagreement between Sackville and Bruce. "What!" he said, "one might have as well have expected Castor and Pollux to rise from their graves and fall a-fighting, as that you two should have had a tussle! But, of course, the affair was confined merely to words, which, we all know, matter little between friends. The story about the batter on the face must be a neat figment clapped upon the adventure by Lady Fame."

"Have you indeed heard," asked Bruce, in some agitation, "that any such incident took place?"

"Oh, to be sure," replied his companion; "the whole Temple has been ringing with it for the last few days, as I am assured by my friend Jack Topper: And I heard it myself spoken of last week to the west of Temple-Bar. Indeed, I believe it was Sackville himself who told the tale at first among some of his revellers; but, for my part, I think it not a whit the more true or likely on that account."

"It is," said Bruce with deep emotion, "too true. He did strike me, and I, for sake of friendship and love, did not resent it. But what, Crawford, could I do in the presence of my appointed bride, to right myself with her brother?"

"Oh, to be sure," said Crawford, "that is all very true as to the time when the blow was given; but then, you know, there has been a great deal of time since. And, love here or love there, people will speak of such a thing in their ordinary way. The story was told the other day in my presence to the French ambassador; and Monsieur's first question was, 'Doth the man yet live?' When told that he was both living and life-like, he shrugged his shoulders, and looked more than I can tell."

"Oh, Crawford," said Bruce, "you agonise me. I hoped that this painful tale would be kept between ourselves, and that there would be no more of it. I still hoped, although tremblingly, that my union with the woman I love would be accomplished, and that all should then be made up. But now I feel that I have been but too truly fore-doomed. That union must be anticipated by a very different event."

"You know best," said the careless Crawford, "what is best for your own honour." And away he tripped, leaving the flames of hell in a breast where hitherto every gentle feeling had resided.

The light talk of Crawford was soon confirmed in import by the treatment which Bruce began to experience in society. It was the fashion of the age that every injury, however trifling, should be expiated by an ample revenge; that nothing should be forgiven to any one, however previously endeared. Accordingly, no distinction was made between the case of Bruce and any other; no allowance was made for the circumstances in which he stood respecting the family of his injurer, nor for their former extraordinary friendship. The public, with a feeling of which too much still exists, seemed to think itself defrauded of something which was its right, in the continued impunity of Sackville's insolence. It cried for blood to satisfy itself, if not to restore the honour of the injured party. Bruce, of course, suffered dreadfully from this sentiment wherever he appeared; inasmuch that, even though he might have been still disposed to forgive his enemy, he saw that to do so would only have encountered greater misery than could accrue from any attempt at revenge, even though that attempt were certain to end in his own destruction.

It happened that just at this time Bruce and Sackville had occasion, along with many other attachés of the court, to attend the Elector Palatine out of the country, with his newly-married bride, Elizabeth, the daughter of the King and Queen. The two young men kept apart till they came to Canterbury, where, as the royal train was viewing the cathedral, it chanced that they saw each other very near. The Elector, who knew a little of their story, immediately called Sackville up to him, and requested his sword, enjoining him, at the same time, in a friendly manner, to beware of falling out with Bruce so long as he was in attendance upon the court. His Highness said, further, that he had heard his royal father-in-law speak of their quarrel, and express his resolution to visit any transgression of the laws by either of them with his severest displeasure. Sackville obeyed the command of the Elector, and withdrew to a part of the cortege remote from the place where Bruce was standing. However, it happened that, in surveying the curiosities of that gorgeous architectural scene, they came to the monument of a Scottish crusader, who had died here on his way back from the Holy Land. Sackville muttered something respecting this object, in which the words "beggarly Scot" were alone overheard by Bruce, who stood at no great distance, and who immediately recriminated by using some corresponding phrase of obloquy applicable to England, to which Sackville replied by striking his former friend once more upon the face. Before another word or blow could pass between them, a number of courtiers had rushed forward to separate them, and they were immediately borne back to a distance from each other, each, however, glaring upon the other with a look of concentrated scorn and hate. The Elector thought it necessary, after what had taken place, that they should be confined for a time to their apartments. But no interval of time could restore amity to those bosoms where formerly it had reigned supreme. It was now felt by both that nothing but blood

could wipe out the sense of wrong which they mutually felt; and, therefore, as the strictness of the King regarding personal quarrels rendered it impossible to fight in Britain, without danger of interruption, Bruce resolved to go beyond seas, and thence send a challenge requesting Sackville to follow him.

In forming this purpose, Bruce felt entirely like a doomed man. He recollected the prediction of the old woman at Culross Abbey, which had always appeared to him, somehow, as implying that Sackville should be the unhappy survivor. Already, he reflected, the least probable part of the prediction had been fulfilled by their having quarrelled. Under this impression, he found it indispensable to his peace that he should return to London, and take leave of two individuals in whom he felt the deepest interest—his mother, and his once-intended bride. Notwithstanding the painful nature of his sensations, he found it would be necessary to assume a forced ease of demeanour in the presence of these beloved persons, lest he should cause them to interpose themselves between him and his purpose. The first visit was paid to his mother, who resided at his own house. He had received, he said, some news from Scotland, which rendered it necessary that he should immediately proceed thither; and he briefly detailed a story which he had previously framed in his own mind for the purpose of deceiving her. After having made some preparations for his journey, he came to take leave of her, but his first precautions having escaped from his mind during the interval, his forehead now bore a gloom as deep as the shade of an approaching funeral. When his mother remarked this, he explained it, not perfectly to her satisfaction, but yet sufficiently so to avert further question, by reference to the pain of parting with his mistress on a long and dangerous journey, when just about to be united to her for life. As he pronounced the words "long and dangerous journey," his voice faltered with tenderness; but there was so much truth in the real meaning of the phrase (however little there might be now), that no metaphorical interpretation occurred to the mind of Lady Bruce. He even spoke of his will without exciting her suspicions. There was but one point in it, he said, that he thought it worth while to allude to. Wherever or whenever it might please fate to remove him from the coil of mortal life, he wished his mother, or whoever might survive him, to recollect that his dying spirit reverted to the scenes of his infancy, and that his heart wished in life that it might never in death be parted from that spot. These words, of course, communicated to Lady Bruce's spirit that gravity which the mention of mortal things must ever carry; but yet nothing seemed amiss in what she heard. It was not till after she had parted with her son—not till she felt the blank impression of his last embrace lingering on her bosom, and thought of him as an absent being, whom it would be long before she saw again—that his final words had their full force upon her mind. Those words, like a sweet tune heard in a crowd with indifference, but which afterwards in solitude steals into and melts the soul, then revived upon her mind, and were pondered upon for days afterwards with a deep and unaccountable sadness of spirit.

It now only remained that he should take leave of his mistress. She was in the garden when he arrived, and no sooner did she obtain a glimpse of his person, than she ran gaily and swiftly towards him, with a face beaming with joy, exclaiming that she had such good news to tell him as he had not ever heard before. This turned out, upon inquiry, to be the permission of her father that their nuptials should take place that day month. The intelligence fell upon Bruce's heart like a stab, and it was some moments ere he could collect himself to make an appropriate answer. Lady Clementina observed his discomposure, and with a half-alarmed feeling, asked its cause. He explained it as occasioned by regret for his necessary absence in Scotland, to which he was called by some very urgent business, so as to render it necessary that the commencement of their mutual happiness should be put off for some time longer. "Thus," he said, "to be obstructed by an affair of my own, after all the objections of others had been removed with so much difficulty, is particularly galling." The disappointment of the young lady was more deeply felt than it was strongly expressed. She was reassured, however, by a fervent and solemn promise from her lover, that, as soon as possible, he would return to make her his own. After taking leave of her parents, he clasped her in one last fond embrace, during which every moment seemed an age of enjoyment, as if all the felicity of which he was about to be defrauded had been concentrated and squandered in that brief space. At one moment, he felt the warm pressure of a being beloved above all earthly objects, and from whom he had expected a whole life of happiness; at another he had turned away towards the emptiness of desolation, and the cold breath of the grave.

One hour did he give to reflection upon all he left behind—an hour such as those which sometimes turn men's hair grey—the next, and all after it, he devoted to the enterprise upon which he was entering. Crawford, whom he requested to become his second, readily agreed to accompany him for that purpose; and they immediately set out for the Netherlands, leaving a challenge for Sackville in the hands of a friend, along with directions as to the proposed place of meeting.

The remainder of this lamentable tale may be best told in the words of Sir George Sackville. That unhappy young man, some months after the fatal tragedy, wrote an account of it to a friend, for the purpose of clearing himself from certain aspersions which had been cast upon him. The language is somewhat quaint; but it gives a more forcible idea than could otherwise be conveyed of the phrenzied feelings of Bruce, under the wrongs which he had suffered from his antagonist, as well as of the actual circumstances of the combat.

"We met at Tergosa, in Zealand, it being the place allotted for rendezvous; he being accompanied with

one Mr Crawford, a Scotch gentleman, for his second, a surgeon, and a man. There having rendered himself, I addressed my second, Sir John Heidon, to let him understand that now all following should be done by consent, as concerning the terms whereon we should fight, as also the place. To our seconds we gave power for their appointments, who agreed we should go to Antwerp, from thence to Bergen-op-Zoom, where in the midway but a village divides the States' territories from the Archduke's. And there was the destined stage, to the end that, having ended, he that could might presently exempt himself from the justice of the country, by retiring into the dominion not offended. It was farther concluded, that, in case any should fall or slip, that then the combat should cease, and he whose ill-fortune had subjected him, was to acknowledge his life to have been in the other's hands. But in case one party's sword should break, because that could only chance by hazard, it was agreed that the other should take no advantage, but either then be made friends, or else upon even terms go to it gain. Thus these conclusions being each of them related to his party, was by us both approved, and assented to. Accordingly we embarked for Antwerp. And by reason, as I conceive, he could not handsomely, without danger of discovery, had not paired the sword I sent him to Paris; bringing one of the same length, but twice as broad; my second excepted against it, and advised me to match my own, and send him the choice, which I obeyed; it being, you know, the privilege of the challenged to elect his weapon. At the delivery of the swords, which was performed by Sir John Heidon, it pleased the Lord Bruce to choose my own, and then, past expectation, he told him that a little of my blood would not serve his turn; and, therefore, he was now resolved to have me alone, because he knew (for I will use his own words), 'that so worthy a gentleman, and my friend, could not endure to stand by and see him do that which he must, to satisfy himself and his honour.' Therefore Sir John Heidon replied, that such intentions were bloody and butcherly, far unfitting so noble a personage, who should desire to bleed for reputation, not for life; withal adding, he thought himself injured, being come thus far, now to be prohibited from executing those honourable offices he came for. The Lord, for answer, only reiterated his former resolutions; whereupon Sir John, leaving him the sword he had elected, delivered me the other, with his determinations. The which, not for matter but manner, so moved me, as though to my remembrance I had not for a long while eaten more liberally than at dinner, and therefore unfit for such an action (seeing the surgeons hold a wound upon the full stomach more dangerous than otherwise), I requested my second to certify him I would presently decide the difference, and therefore he should presently meet me on horseback, only waited on by our surgeons, they being unnamed. Together we rode, but one before the other, some twelve score paces, for about some two English miles; and then passion having so weak an enemy to assail as my discretion, easily became the victor, and, using his power, made me obedient to his commands. I being verily mad with anger that the Lord Bruce should thirst after my life with a kind of assuredness, seeing I had come so far and needlessly to give him leave to regain his lost reputation, I bade him alight, which with willingness he quickly granted, and there in a meadow, and deep in water at the least, bidding farewell to our doublets, in our shirts began to charge each other; having afore commanded our surgeons to withdraw themselves a pretty distance from us, conjuring them besides, as they respected our favours, or their own safeties, not to stir, but suffer us to execute our pleasure; we being fully resolved (God forgive us!) to dispatch each other by what means we could. I made a thrust at my enemy, but was short, and, in drawing back my arm, I received a great wound thereon, which I interpreted as a reward for my short shooting; but in my revenge I pressed into him, though I then missed him also, and received a wound in my right pap, which passed level through my body, and almost to my back. And there we wrestled for the two greatest and dearest prizes we could ever expect trial for, honour and life. In which struggling, my hand, having but an ordinary glove upon it, lost one of her servants, though the meanest. But at last breathless, yet keeping our hold, there passed on both sides propositions of quitting each other's swords. But when amity was dead, confidence could not live, and who should quit first was the question, which on neither part either would perform; and restraining again afresh, with a kick and a wrench I freed my long captive weapon, which incontinently levying at his throat, being master still of his, I demanded if he would ask his life, or yield his sword, both which, though in that imminent danger, he bravely denied to do. Myself being wounded, and feeling loss of blood, having three conduits running on me, which began to make me faint, and he courageously persisting not to accede to either of my propositions, through remembrance of his former bloody desire, and feeling of my present estate, I struck at his heart, but, with his avoiding, missed my aim, yet passed through the body, and drawing out my sword, repassed it again through another place, when he cried, 'Oh! I am slain!' seconding his speech with all the force he had to cast me. But being too weak, after I had defended his assault, I easily became master of him, laying him on his back—when being upon him, I redemanded if he would request his life; but it seemed he prized it not at so dear a rate to be beholden for it, bravely replying, 'He scorned it.' Which answer of his was so noble and worthy, as I protest I could not find in my heart to offer him any more violence, only keeping him down until at length his surgeon afar off, cried, 'He would immediately die if his wounds were not stopped.' Whereupon I asked if he desired his surgeon should come, which he accepted of; and so, being drawn away, I never offered to take his sword, accounting it inhuman to rob a dead man, for so I held him to be.

This thus ended, I retired to my surgeon, in whose arms, after I had remained a while, for want of blood, I lost my sight, and withal, as I then thought, my life also. But strong water and his diligence quickly recovered me; when I escaped a great danger; for my Lord's surgeon, when nobody dreamt of it, came full at me with his Lord's sword; and had not mine with my sword interposed himself, I had been slain by those base hands; although my Lord Bruce, weltering in his blood, and past all expectation of life, conformable to all his former carriage, which was undoubtedly noble, cried out, 'Rascal, hold thy hand!' So may I prosper, as I have dealt sincerely with you in this relation.

"Louvain, September 8, 1613."

Such is the melancholy story of Edward Lord Bruce, a young nobleman, who, but for a false point of honour, arising from the incorrect judging of the world, might have lived to make many fellow-creatures happy, and adorn the annals of his country. The sacred griefs of those to whom he was most peculiarly endeared, it would be vain to paint. A mistress, who wore mourning, and lived single for his sake all the rest of her life—a mother, who survived him only to mourn his irreparable loss—upon such holy sorrow it is not for me to intrude. It may be only mentioned that the latter individual, recollecting the last parting words of her son, caused his heart to be embalmed, and brought to her in a silver case (the body being buried in the cathedral of Bergen-op-Zoom), and carried it with her to Culross, where she spent the remainder of her life in gloomy solitude, with that object always before her upon her table. After her death, it was deposited in the family vault already described, where it has ever since remained, the best monument of its own fatal history.

HOURS OF THE DAY.

In all parts of Christendom, or the civilised world (with the exception of Italy), it is customary to divide every complete revolution of day and night into twenty-four hours, reckoning twice twelve, and beginning the day precisely at midnight. Has it ever occurred to my young readers that this process of enumerating the hours of the day, and settling its commencement at midnight, are the result of conventional usage, and are of comparatively modern date? In ancient times the day was divided into twelve parts, and the night into four watches. The parts into which the day was divided consisted of portions of time, or hours, which varied in length according to the season. In that period of the year when the day-light remained longest, the hours were made 70 minutes in length; and when the days were short, the hours were of less than 50 minutes in length; when light and darkness were equal, the hours were of much the same length as they are with us. These proportions of summer and winter hours are of course stated generally, for they varied according to the latitudes of every particular place. It is, however, very uncertain whether the ancients began the day with sunrise, or with the first appearance of the light in the east. The four watches into which the night was divided consisted each of three hours in length. To determine the exact terminations of these watches, was a matter of great difficulty. The Jews, whom we may take for an example, kept watchmen, or servants, for the sole purpose of watching the stars; by the rising, altitude, and disappearance of which they tried to calculate the lapse of time. These time-keepers are noticed in the Books of the Old Testament, particularly in the 11th and 12th verses of the 21st chapter of Isaiah: "The burden of Dumah. He calleth to me out of Seir, Watchman, what of the night? Watchman, what of the night? The watchman said, The morn cometh, and also tonight," &c. Among the Romans, each watch was announced by the sound of a trumpet. The Jews had this other peculiarity in the computation of their time; they began the day with the evening. ("And the evening and the morning were the first day.") Hence, till the present time, their day begins, as we would say, in the evening of the day before, and, as it happens to be, at six o'clock P.M.

It is not exactly known when the present mode of beginning the day at midnight first came into use; but it is certain that for several centuries after the introduction of Christianity, the Christians continued to compute their time after the manner of the ancients, in which case they would probably begin their Sabbath on Saturday at six o'clock in the evening, and finish it on Sunday evening at the same hour. It is understood that we are indebted to the Church of Rome for the excellent invention of beginning the day at midnight. As many of the church festivals were kept up to a late hour at night, and others began at an early hour in the morning, the middle of the night appeared the most expedient division between the two days. The influence of religion naturally induced a similar observance in civil affairs, and this division became a general rule. The only difference now existing in most Christian countries is that between mean time (that which is indicated by a clock), and apparent time (that which is indicated by a sun-dial.) Mean time is generally used in England, but on the Continent apparent time seems chiefly to prevail. As the apparent course of the sun is not uniform as the motion of a good clock, it is evident that mean time, which never requires alteration, is the most convenient division. The Italians (I here quote from the Companion to the Almanack) follow a mode of computing time different from that which is in use in any other part of Europe, and which, although convenient enough for some purposes, is so much at variance with the true-going of clocks, and with the practice of other nations, that it seems likely to be abandoned at no very remote period. It is now, in fact, but partially used in the larger towns of Italy—most public clocks in Florence, Rome, and Milan, being set to the hour designated on French or English clocks. The Italian hours, instead of being regulated by the

coming of the sun to the meridian, as with us, depend on the hour of sunset, and consequently differ in every different latitude. The close of the day is considered to take place half an hour after sunset, from which time the hours are counted straight on from 1 to 24, instead of being divided into twelve. One o'clock is therefore an hour and a half after sunset, two o'clock two hours and a half after sunset, and so on for four and twenty hours. This strange custom is found very puzzling by English travellers. The division of the day among Mahomedans is chiefly subservient to the stated times of performing their devotions, and is not generally accurate. They begin their account at sunset, reckoning twelve hours from thence till sunrise, whether the night be long or short; from sunrise till sunset they also reckon twelve hours, and consequently a night hour is longer in the winter than an hour of the day, and in summer the hours of the day are longer than those of the night. At the equinoxes alone, all the hours are of equal length. The Chinese division of the day is as simple as our own, and not much unlike it. The Chinese begin the day an hour before midnight, and divide the twenty-four hours into twelve parts, of two hours each; instead of numbering the hours 1, 2, 3, &c. as we do, they give a different name to each period of two hours. The names of these periods are *toze, chow, yin, maow, shin, sze, woo, we, shin, yew, seo, haas*. The word *keawo* is added when the first hour of each period is intended, and *ching* for the last. There are also words for the quarters, but it does appear that smaller divisions are reckoned. The Hindoos divide the day into four watches, and the night into the same number; the day being considered to extend from sunrise to sunset. The watches are again divided into *ghurees*, or hours, which are, each 24 minutes in length. The Hindoos measure out and mark the ghurees in a curious manner. They provide a thin metal cup, through the bottom of which a small hole is drilled; the cup swims on the surface of a vessel of water, until the water, running gradually through the hole, fills the cup, which then sinks. The hole is made of such a size, that the water rising sinks it in 24 minutes. A sort of gong, or shallow bell-metal pan, called a *ghureal*, is hung up near the vessel, to be struck at the expiration of each ghuree, which is known by the sinking of the cup. A man who is employed to watch the sinking of the cup, and to strike on the bell, is called a *ghurealee*. For the complete establishment of a ghuree, six or eight servants are necessary, who keep watch in turns. Such an expense can, of course, be afforded only by the wealthy; but the sound of a gong is usually loud enough for a whole village, and serves the purpose of a church clock.

FORMATION OF SCOTTISH SOCIETY.

(Continued.)

THE noble Scottish family of *Rollo* derives its origin from Richard de Rollo, an Anglo-Norman, who settled in Scotland during the reign of David I., and from this munificent prince received some lands in Perthshire, where this ancient race was planted, and still remains. In 1651, the family of Rollo was advanced to the peerage. The Scottish name *Rollock* is supposed to be from the original. The family of *Kinnaird* derives its origin from the same eventful period. Rodolph, the progenitor of the race, received the lands of Kinnaird, in the Carse of Gowrie, from William the Lion; and the family name was taken from the property. The *Ruthvens* are sprung from a person called Thor, of Saxon or Danish lineage, who came from the north of England, and settled in Scotland under David I. Thor having attached himself to Earl Henry, is believed to have received a grant of the lands of Ruthven from him, and hence the name of Ruthven came to be the surname of the race. The main branch of this family obtained the earldom of Gowrie, 1581. The respectable Scotch family of *Durward* deduces its origin from the De Lundins or Lundie, of Fife and Forfarshire, already mentioned. The first who received the appellation was Thomas, the son of Malcolm de Lundie, who, receiving from William the Lion the office of *doorward* (*hostearius*), or keeper of the King's door, the name became fixed upon him; and, as the office was made hereditary, the appellation was continued in the family.

The *Abernethys* are sprung from a person of English lineage, called Orm, the son of Hugh, who flourished in Scotland under Malcolm IV., and who, receiving the lands of Abernethy, at the foot of Strath-eam, his descendants assumed the name of Abernethy. There were a number of *Orms* who came into Scotland, and have left traces of their residence in places of the name of *Ormiston*, which is common in the southern parts of the country. The *Grays* are also of Anglo-Norman extraction. A younger son of Gray of Chillingham, a Norman family, who settled in Northumberland, obtained a settlement in Scotland under William the Lion. From this personage the various families of the surname of Gray are descended. The *Kers*, or *Cars*, were Anglo-Normans, and a branch

settled in Scotland during the thirteenth century. They possessed lands on the Borders, and originated the two respectable houses of the Kers of Cessford and Fernieherst. From the former sprung the noble family of Roxburghe, and from the latter that of Lothian. The word *Ker*, or *Cur*, signifies a strength or fortlet, and is significant of the adventurous military character of the first of the name. The *Colvils* trace their origin in Scotland to Philip de Colville, who came thither in the twelfth century, and acquired possessions in various parts of the country, particularly in Ayrshire, where the noble house of the Colvilles, Lords of Ochiltree, was founded. The distinguished house of Gordon is likewise of Anglo-Norman origin. The first of the race, having settled in Berwickshire, soon after the commencement of the twelfth century, took the surname of Gordon, from the title of his estate, which is still called Gordon. At the end of the thirteenth century, Sir Adam de Gordon acquired lands in Galloway, which he gave to William, his second son, who was the progenitor of the Viscount Kenmure. Sir Adam afterwards acquired lands in Strathgogle, on the forfeiture of their previous possession; and on that account removed with the main line of the family to the north, where it has since remained. The numerous families of the name of Gordon in Scotland are all derived from this common stock.

The noble family of *Graham* was also of English origin. The first of the race in this country was William de Graham, who settled under David I., and obtained from that monarch the lands of Abercorn and Dalkeith, in the Lothians, where he sat down with his followers. When William de Graham died, he left two sons, Peter and John, the first of whom inherited his father's lands in the Lothians, and was succeeded by a race which took a lead in the district till the time of Robert Bruce. This branch of the house then merged in a female heir, who married William de Douglas, the predecessor of the Douglasses of Lothian, who became Earls of Morton. The descendants of John, the second son, received lands in Forfarshire, and laid the foundation of the distinguished family of the *Grahams* of Montrose. The chief families in Scotland with the name of *Graham* are descended from this honourable source; among other persons conspicuous in history to which it gave rise, was *Graham* of Claverhouse, Viscount Dundee.

Few of the Anglo-Norman settlers of David the First's reign arrived at such eminence as the *Sinclairs*, or *Saint Clairs*. The principal families in Scotland of this name are descended from the Anglo-Norman family of *Saint Clair*, who came to Britain with the Conqueror. Two distinct branches settled in this northern part of the island, the *Sinclairs* of Roslin and the *Sinclairs* of Hermandston. The progenitor of the first was William de Saint Clair, who obtained the manor of Roslin, in Mid-Lothian, where he settled during the reign of David I. This family was in after times raised to the earldom of Orkney. From the same stock sprang *Sinclair* Earl of Caithness, *Sinclair* Lord Sinclair, and many others. The *Sinclairs* of Hermandston derived their origin from a later settler, under the *Morvilles*, Constables of Scotland, and gave rise to a number of respectable families.

The families of *Ros*, in the north of England, and in the south of Scotland, are of the same root, having taken their name from the lordship of *Ros*, in Yorkshire. The first settlers of the name in Scotland appear as vassals of the *Morvilles* in Ayrshire, and having obtained the lands of *Stewarton*, became the progenitors of the *Rosses* of *Hawkhill*, of *Ross* Lord *Ros*, of *Ros* of *Tarbet*, in *Cunningham*, of *Ros* of *Sanquhar*, and other families of the name in the south of Scotland; besides the *Roses* of *Kilravoch*, the *Roses* of *Geddes*, *Rose* of *Howe*, and others in the north.—*To be continued.*

CURIOUS RESULT OF INJURY OF THE BRAIN.

There are instances, says Mr Green in his lectures, at King's College, as reported in the *Medical and Surgical Journal*, where a whole class of words, nay, a language, was completely obliterated from a man's memory. I remember seeing a patient in St Thomas's Hospital who had an injury of the head. During his illness he began suddenly to speak in a language which nobody in the ward could understand; very fortunately in one of the most voluble moments of this patient the milkman of the hospital was passing through the ward and listening to the sick man, who instantly recognised the Welch language. A freer communication immediately took place between the parties, and it appeared, according to the account delivered by the milkman, that the patient understood and spoke English very well, but that, in consequence of the accident, that language had been fairly knocked out of his head.

BRITISH COLONIES.

A BRIEF recital of the number of our colonial possessions, and their utility in point of trade, may be of value to a number of our readers who have not had leisure to examine this very important branch of affairs. Notwithstanding the loss of the United States, the colonies of Great Britain, exclusive of India, exceed in number, extent, and value, those of every other country. In North America we possess the provinces of Lower and Upper Canada, Nova Scotia, and New Brunswick, with their dependencies, in which are included Prince Edward's Island. Great Britain also possesses the Hudson's Bay territory; a tract of vast extent, but situated in an unprofitable climate, and worth very little except as hunting grounds for beaver, &c. We also possess the large islands of Newfoundland and Cape Breton, but the soil is barren, and the climate severe and foggy; so that they are valuable principally as fishing stations. The entire population of all these North American colonies may be estimated at about one million.

In the West Indies we possess Jamaica, Barbadoes, St Lucia, Antigua, Grenada, St Vincent, Trinidad, and some other islands, exclusive of Demerara, Berbice, and Essequibo, in South America. Jamaica is by far the largest and most valuable of our insular possessions. Demerara, Berbice, and Essequibo, were taken from the Dutch during the late war, and were definitively ceded to us in 1814. The British also possess the settlement of Belize in the Bay of Honduras.

In the East we possess the island of Ceylon, which, though populous, is one of the least valuable of our possessions. The British possess a large and not very valuable territory in Southern Africa, called the Cape of Good Hope, of which Cape Town is the capital. This colony was also ceded by the Dutch to the British in 1815. Great Britain likewise owns the island of Mauritius, which was ceded by the French in 1814. This island is not very fertile, and it measures about 150 miles in circumference. The largest possession of the British in the Southern Hemisphere is the island, or continent, of New Holland, and the adjoining island of Van Diemen's Land. These with their dependencies receive the collective appellation of Australasia. The population of the whole is only about 37,000, exclusive of aborigines. The most valueless of all our possessions is Sierra Leone, a district on the south-west coast of Africa. This colony was founded partly as a commercial establishment, but more from motives of humanity. It was intended to consist principally of free blacks, who, being instructed in the Christian religion, and in the arts of Europe, should become, as it were, a focus whence civilisation might be diffused among the surrounding tribes. About 1200 free negroes, who having joined the royal standard in the American war, were obliged, at the termination of that contest, to take refuge in Nova Scotia, were conveyed thither in 1792: to these were afterwards added the Maroons from Jamaica; and since the legal abolition of the slave trade, the negroes taken in the captured vessels, and liberated, have been carried to the colony. The total number of liberated Africans under the superintendence of the colonial authorities is about 22,000. Great efforts have been made to civilise those blacks, but all have failed, and the colony presents a melancholy instance of perverted and abused national philanthropy.

The British possess certain islands and places in the Mediterranean. The chief possession in this quarter is Malta, an island 20 miles long, and from 10 to 12 broad. It was definitively ceded by the French in 1816. It is retained as a military and naval station. The population, including troops and strangers, amounts to about 102,000. The small island of Gozo, adjacent, has a population of about 17,000. The Ionian Isles, in Greece, also belong to Great Britain. The principal foreign military station belonging to the British in this part of the world is Gibraltar, a rocky promontory near the southernmost extremity of Spain, and commanding the strait which communicates betwixt the Atlantic and the Mediterranean. The population is about 16,500, exclusive of the troops, which usually amount to 3000 or 4000. Such are the British colonial possessions worth mentioning.

The retention of colonies is understood to serve two chief purposes. The import and export trade with them is said to be of great benefit to the mother country; and this traffic encourages the maritime profession, which is always associated with the welfare of this insular nation. The trade carried on betwixt Great Britain and some of its colonies is immense. In the year 1829 the imports from the British North American colonies amounted in value to L.1,088,622, and the exports thither to L.2,064,126. In the same year, 1609 ships arrived from the same colonies with a burden of 431,124 tons, while 1652 ships cleared outwards with a burden of 418,147 tons. The imports consist generally of timber, ashes, fish, oil, skins, and other raw produce. The exports consist of luxuries of every description, and all kinds of manufactured goods. The British West India colonies export three great articles, sugar, coffee, and rum. In the year 1830 there were about 4,000,000 of hundred weights of sugar imported from thence,

upwards of 27,000 of lbs. of coffee, and nearly 8,000,000 gallons of rum. From this vast importation of goods the government received in duties seven millions five hundred thousand pounds sterling, being between a seventh and a sixth of the whole revenue of the British empire. The exports from this country to our West India colonies consist of coarse cottons, linens, checks, hats, and other articles of negro clothing; hardware and earthenware; staves, hoops, coal, lime, provisions, fish, furniture, &c. The total amount of imports from the West India colonies in the year 1829 was L.9,087,914, while the total of exports in the same year was L.5,521,169, of which Jamaica itself had about L.2,000,000. The number of ships which arrived was 968, having a burden of 263,338 tons; the number outwards was 918, with a burden of 252,292 tons. The prices of all kinds of West India produce have greatly fallen, on account of the cultivation of the same articles being now carried on in new countries not formerly taking part in this trade. The British possessions in the Bay of Honduras afford means of obtaining abundant supplies of mahogany, and serve as an *entrepôt* for the supply of Guatemala with English goods. The trade with the remaining colonies is of inferior value. Mauritius exports nearly 500,000 hundred weights of sugar annually; its coffee trade is declining; it exports tortoise-shell to the extent of L.9000 a-year. Provisions, machinery, clothing, &c. are largely imported. With regard to the Cape of Good Hope, it appears that that colony exports to Great Britain goods to the value of about L.200,000, on an average, annually, while the value of the exports thither amounts to upwards of double that sum.

TRADITIONS OF THE PLAGUE IN SCOTLAND.

[THE following notices of the Plague in Scotland were, like the Tale of the Plague in a former publication, written several years before any expectation was entertained of our being again visited by pestilence, and while, indeed, any apprehension of that kind would probably have been laughed at. They are now brought forward, on account of the temporary interest which they derive from the actual presence of a similar calamity amongst us. It is curious to know what impression remained at a late date on the minds of the common people, respecting the visitation with which their ancestors were afflicted two hundred years ago: it is the next thing to acquiring an idea of the actual feelings of the people under the calamity. We may thus be helped to draw a contrast, more or less correct, between the way in which the awful "plague of pestilence" was endured by a people rude and untutored like those of the seventeenth century, and the conduct of a generation certainly possessed of far more worldly knowledge, and in whose favour medical skill and general humanity are infinitely more on the alert.]

In numerous places throughout Scotland, spots are shown, where, according to the belief of the common people, "the plague was buried." It is now so long since this dreadful epidemic afflicted the country, that few know what is implied by this tradition, or even what the plague was. All that is generally to be learned from the populace upon the subject simply is, that within this mound, or beneath this stone, LIES THE PLAGUE; and no one would break the one or remove the other for any consideration short of life and death. How melancholy the reflection, that perhaps a century hence the same species of tradition may indicate the spot in our churchyards where the *cholera* lies interred!

Spots are pointed out as the burial places of the plague at Nether Minzies, in Tweedsmuir, where the shepherds are scrupulous to prevent their sheep from feeding within the little circle which encloses the tomb of plague: and near Prestwick in Ayrshire, where are also shewn the ruins of a house, built by Robert Bruce for the reception of lepers, still called King Case. In order, moreover, to show that individual suffering was little considered in cases where the public welfare was endangered, it may be mentioned, as one of the rules of a leper house at Greenside, at the north base of the Calton Hill, Edinburgh, that the penalty imposed upon any inmate who should venture out of doors was no less than death; and that with a view at once to the prevention of such a misdeed, and its prompt punishment, a gallows stood constantly in readiness at the end of the house.

At Peebles a place is shown in the neighbourhood of the town where "the plague was buried." It is a low mound, like a grave, but much larger, situated in a marshy valley, called the Gytes. Children designate this place Sampson's Grave, probably on ac-

count of its appearing to be such a grave as would hold that scriptural hero, whose bulk is popularly supposed in Scotland to have been of a piece with his strength.

Amidst the ruins of the ancient collegiate church of Methven, in Perthshire, it is popularly believed that a vast treasure lies concealed. This, it is said, would not have been permitted to lie so long, had it not been understood that the plague was also buried in the same place, and would burst out if any excavations were attempted. Some excavations were attempted by the country people; but before they had got many feet beneath the surface, a suspicious-looking vapour arose, and, according to the account of the treasure-seekers, a low terrible voice was heard to vociferate, as from some remote recess of the ground, "Let sleeping dogs lie!" whereupon the shovels and mattocks were instantly abandoned by the adventurers, whose task no one has ever since thought of resuming.

The pestilence which afflicted Edinburgh and neighbourhood in 1645 appears to have been particularly fatal to the inhabitants of the village of Water of Leith, so much so, that all intercourse with that village was at that time strictly prohibited. At length, however, on the 15th May, the restriction was taken off in part. The register of the parish of that date bears the following entry:—"Thos in the southsyd of the Watter Leith being long inclosed ar liberat, on conditione they resave na clothes to washe." During that fatal period also, no large convivial parties were allowed to convene; nay, a fine of L.10 Scots was imposed on all who invited more than twelve persons to their marriage, or six when their child was baptised. From June till December, even the kirk session did not assemble; and none who died of the plague were allowed to be interred in the churchyard on Sabbath from sun-rise to sun-set.

Thomas the Rhymer prophesied to the monks of Aberbrothock,

From Sidlaw eastward to the sea
Plague nor pest shall ever be.

And it is very remarkable, that the great plague ravaged Dundee, Brechin, and Montrose, without ever touching Arbroath.

Few towns suffered so much by the plague as Brechin, the inhabitants of which place have inherited a salutary dread of its visitations. It attacked the town in the year 1647, at a time when it had not recovered from the effects of a general conflagration inflicted by Montrose, two years before. Its ravages are commemorated on a rude tablet in the churchyard, by an inscription in these words:—

1647.

Luna quater crescens
Sexinto, peste peremptos,
Disce mori, vidit.

Implying that in the month of April 1647, six hundred people were taken away by the plague: "Learn to die."

The most curious and superstitious tradition connected with the plague is one told by the people in Kincardineshire, who, like many others, are of belief that the plague had a bodily form, and flew through the air in the shape of fine threads, or minute flying serpents. On the farm of Mindynes, in the parish of Fordoun, and at no great distance from the banks of the river Bervie, stands in the middle of a ploughed field a large stone, underneath which the plague is said to have been buried. At the last occurrence of "the pest" in Scotland, say the peasantry, there dwelt in this district a benevolent warlock, who determined to free his country for ever from the terrible destroyer. By dint of spells he succeeded in drawing towards him the whole material of the plague, and winded it up round his fingers, as people wind thread. The clew reached the size of a man's head before every particle was collected. When completed, he took it in his hand to the spot mentioned, put it into the earth, and covered it with a large stone. All this was done by spells, the power of which ceased when the stone was laid down; so that, according to the popular belief, if that stone were to be removed, there is no saying what might be the direful consequences. At the very least, the ball would burst forth, explode, and the plague would again overspread the country!

EMIGRATION.—UPPER CANADA.

As this journal does not happen to be a newspaper, I do not find myself at liberty to detail the progress of emigration from Great Britain, and especially from Scotland, towards North America; but I cannot be prevented from giving my friendly advice to those who feel inclined to swell the flood of human beings pressing on towards the western settlements. From all that I have read on the important subject of emigration, I am induced, from many considerations, to give a decided preference to Upper Canada. This extensive territory has also its preferable places of settlement. That part of the province which stretches from Lake Simcoe and the rivers Trent and Severn, westward to Lake Huron and the St Clair River, and southward to Lake Erie and part of Lake Ontario, has a soil of extraordinary fertility, capable of producing the most luxurious crops of wheat, and every other sort of grain. The climate is so particularly salubrious, that epidemic diseases, either among men or cattle, are almost entirely unknown. Its influence on the fertility of the soil is more generally perceptible than it is in Lower Canada, and is supposed to be congenial to vegetation in a much superior degree. The winters are shorter, and not always marked with such rigour as in the latter. The duration of frost is always accompanied with a fine clear sky and a dry atmosphere. The spring opens, and the resumption of agricultural labours takes place, from six weeks to two months earlier than in the neighbourhood of Quebec. The summer heats rarely prevail to excess, and the autumns are usually very friendly to the harvests, and favourable for securing the late crops. What a splendid tract of land lies in the angle formed by Lakes Huron and St Clair on the west, and Lakes Erie and Ontario on the south! In some pleasant spot in this well watered and salubrious district I would purchase my farm and build my log-house. The lakes just mentioned communicate with the River St Lawrence, and give to this territory all the advantages of an extensive inland navigation, and serve as an outlet for exports. This tract of land, lying with its base on Lakes Ontario and Erie, as far west as the junction of the Thames with the St Clair Lake, is laid out in townships, and partly settled. But the population is so very thin, as not, on an average, to amount to more than sixteen persons to a square mile, in settled townships; while the fertility of the soil is such, that 120 persons to a square mile would not be a dense population. To the north of the river Thames, along the banks of the St Clair, and the shores of Lake Huron, round to the river Severn, and thence to the river that joins the Nipissing and Lake Huron, is a boundless extent of country that is entirely unoccupied. The interior of this space has hitherto been but imperfectly explored; but the banks of the St Clair, and the shores of Lake Huron, afford the finest situations for settlements. The soil is in many places of the greatest fertility, the river and lake teem with fish, and every variety of the best timber is found in the greatest profusion. In 1783, the settlers in Upper Canada were estimated at only 10,000; in 1825 they amounted to upwards of 157,000, and now amount to about 190,000—a miserably small population for a country that could easily support many millions of inhabitants in a state of the greatest comfort.

Having wound up your affairs in this country, and otherwise prepared yourself and your family for proceeding to the Land of Promise, it is recommended that you should take with you a box of tools, whether you be learned to use them or not. The tools should consist of an American axe, hand saw, wagger, pickaxe, spade, two gimlets, a hammer, iron wedge, three hoes, a kettle, frying pan, an iron pot, nails, and a small portable handmill for grinding corn; a gun and fishing nets will be of great service, if you have means to purchase them. You should also have good warm freeze coats and jackets, and worsted stockings and mittens for the winter; linen trousers and jacket for the summer, as many linen shirts as you can afford to take out (linen being dear in Canada), and a short flannel shirt, to be worn next the skin, both in summer and winter. Without caution as to clothing, the settler has a chance of being attacked with ague, which is the only complaint to be dreaded. You should also provide yourself with a small stock of simple medicines, to preserve the bowels in regularity. Every one ought to take a dose of medicine on landing. No bulky articles or furniture of any kind should be taken. Every thing should be packed in substantial handy trunks. Plain furniture can be bought at a cheap rate in the colony, or you can perhaps manage to make some useful articles for your new household. The bark of the bass tree, woven or laced across your bedstead, will support a mattress, and that mattress need consist of nothing more expensive than the boughs of the spruce fir, or dry beech leaves; a buffalo skin will answer for quilt and blankets. In sailing to Canada, Greenock is preferable to any port in Scotland, and vessels may nearly always be found there ready for departure.

In removing, many persons prefer to enter into arrangements with agents of the Canada Company in London, Edinburgh, or other places, making a small deposit in their hands. This seems an advisable plan. The Canada Company is a most respectable associa-

tion, possessing a large tract of land of that part of Canada above recommended. The agents of the Company, on the arrival of the emigrants at Quebec or Montreal, will convey, at the Company's expense, purchasers who pay a first instalment in this country of 2s. an acre upon not less than one hundred acres, to the head of Lake Ontario, which is in the vicinity of their choicest lands; and their agents in all parts of the Upper Province will give emigrants every information and assistance in their power. Should emigrants, on arrival, not settle on the Company's lands, the money paid them will be returned, deducting the actual expense of conveyance to York. The Canada Company sold upwards of eighty thousand acres of land in 1829, 1830, and 1831, in lots of various extent, at from 10s. to 14s. per acre. Much the same prices are now charged by the government for land; 10s. an acre being the average price, of which 2s. must be paid on purchasing, and the remainder in annual instalments, with interest, which an industrious settler would be able to pay out of the crops. There are always a number of half-cleared lands in the market for sale; and when the emigrant has a little capital, and is not very well adapted to commence the operation of clearing, these are particularly worthy of his attention. At York, Upper Canada, every information is to be had regarding cleared and uncleared lands; and such is the choice, that no time may be lost in making a selection. The expense of clearing the land ready for seed is from L.2, 10s. to L.3, 10s. per acre, if paid in money. To a person who is about to settle on an entire woodland, I would recommend the following system:—Clear well a few acres in the immediate vicinity, and all around the site on which the house is intended to be built, that the trees left standing may be at a sufficient distance to be out of danger falling on it, and let a small piece be fenced off for cattle to lie in at night, out of the same danger, in windy weather; then cut down, on ten or fifteen acres, the small and decayed trees and under-brush; burn them, and girdle or notch round the remainder of the trees; sow this ground with wheat early in the fall (autumn), or part of it with oats in the spring, and with them clover and a small quantity of grass seeds mixed; the clover and grass to be mowed the first year or two, and grazed afterwards. Do the same next year with a still further quantity, for six or seven years in succession, and likewise clear a small piece quite off for corn and potatoes, cabbage, &c., in front of the house, and next to the road. In about six or seven years the roots of the trees will be rotten, and some of the girdled ones fallen; then begin and chop down ten or fifteen acres of these girdled trees yearly, in a dry time, felling them across each other to break them in pieces; put fire into them in various parts of the field, and it will burn most of them up; what little may be left unconsumed must be collected into heaps, and burned. It is necessary to keep a watch over the fences while this is going on, that they do not take fire. After this you may plough and plant what you please, as generally the ground will be in pretty good condition. The mode of sowing wheat for the first two years on new land is very simple—merely harrowing in the seed; for the soil is so rich that it requires no artificial dressing. Wheat is sown in the fall; oats are sown in May or June. After clearing the land, potatoes and turnips answer remarkably well.

All the fruits and vegetables common to the English kitchen garden thrive well. Sugar, for domestic purposes, is made from the maple tree on the land. The soil and country possess every requisite for farming purposes, and comfortable settlement. The samples of Upper Canada wheat have not been exceeded in quality by any in the British market. With regard to the price of labour, it should be mentioned that it is expensive in Upper Canada, and that there is an absolute necessity for the emigrant and his family working with their own hands. Persons desirous of employment as agricultural labourers will receive from L.2 to L.3 per month, with board and lodging. At these wages there is a constant demand for labour in the neighbourhood of York. Working artizans, particularly blacksmiths, carpenters, bricklayers, masons, coopers, mill-wrights, and wheelwrights, get high wages. However, industrious men of every class may look forward with confidence to an improvement in their situation, as many save enough out of one season's work to buy land themselves in settled townships.

SCOTTISH AND ENGLISH PEASANTRY.

Two English gentlemen, about sixty years ago, happened to have a dispute respecting the character of the Scottish peasantry; one party maintaining the superiority of the natives of Scotland, as compared with those of England, in point of intellect and information, while the other espoused the contrary opinion—contending that, amongst the lowest class of bumpkins in any country, the degree of knowledge must be nearly on a par. A wager was the result; and, governed perhaps by a whim of visiting Scotland—a portion of the empire at that period very little known or thought of—more than by any other consideration, our two gentlemen, who, it seems, were men of considerable opulence, were not long in reaching Edinburgh; and thereafter, as a matter of course, found their way to Clirehugh's Tavern, in Wri-

ter's Court, as the most respectable house of entertainment which at that time graced the Scottish metropolis, although, in the present day, a house of such a bearing would be most decidedly and emphatically sneered at by any one having the slightest pretensions to *haut ton*. Our travellers, after having visited the few lions then worth seeing in the northern capital, bethought themselves of the main object of their trip; and no better means of coming to their point occurring, they resolved to impart the secret to their host, who, withal, appeared a shrewd, sensible fellow, and likely to aid them in the matter in hand.

Clirehugh instantly comprehended the affair; and after a pause, recollected, as it were accidentally, that *Coal John*, a Gilmerton carter, who served the house in the way of his calling, and whom he did not fail to describe as the most rustic clown extant within ten miles of the city, would be there, with a cartful of his commodity, early in the course of the morrow. It was therefore settled, that, as the said John was just the kind of man the gentlemen were in quest of, he should, by some means or other, be introduced to them on his arrival. In the mean time, Clirehugh, who had begun to get a good deal interested in the result of the wager, as a matter involving a point of national honour, had come to the resolution not to trust its issue to the "real Simon Pure," but to one who should personate John, and who could be more relied on.

The individual pitched upon by Mr Clirehugh was one admirably adapted to sustain the character—a true type of the genus *Driver*—a character at that time by no means uncommon in Edinburgh; a shabby subaltern of the law; one of those queer, reckless, drink-and-drown-care sort of fellows, whom a periodical acquaintance with toddy and oysters, when these could be got, and at least a diurnal acquaintance with the gill-stoup and small ale, in less propitious seasons—with the help, at all times, of a select jumbo of drouthy brother cronies—reconciled to the business of the day, without imparting much disquietude as to the cares of the morrow. Such was the individual who undertook the part of John the coalman; a wight of "shrewd parts and pregnant humour." At the appointed time, therefore, our hero betook himself to what might be styled the Rialto of the Carbonari; in other words, to that quarter of the city where the gentlemen of that profession were "wont most to congregate,"—namely, St Mary's Wynd, the thoroughfare by which the great bulk of the coal for the consumption of the city, at that time, was accustomed to pass. There, by virtue of a suitable parole and countersign, given to the *bona fide* John, who was soon spoke on that highway, he easily furnished himself with the appropriate costume and other adjuncts of the character, including, of course, the cart with its contents.

Endued, therefore, in one of the most conspicuous *habits de corps* of the coal fraternity—consisting, *inter alia*, of blue-ribbed stockings, shoes with soles rather thicker than what the Cockneys call Vauxhall slices, studded, moreover, with nails which might have served for the decoration of the postern gate of *Front de Bauff's* castle, corduroy jacket and trousers, with dubious-coloured plush vest and other *et ceteras*, not omitting a *quant. suff.* of coom on his face—the self-elected John wended his way up the High Street of Auld Reekie.

The shrill hilloo of Tom Pipes, when announcing to Tunley, the landlord, the august approach of the naval duumvirate, Truncheon and Hatchway, could not be more astounding than the intimation given to Mr Clirehugh's establishment of the arrival of the coals—said intimation conveyed, of course, in the choicest and most prolonged cadence of Gilmerton—a *patois*, by the way, it may safely be said, which is, of all other Doric dialects, the most offensive to an English ear: "Hollo, the coals!"

The inmates of the house were of course advertised beforehand; and the next question was, to drag John into the presence of the two English gentlemen. In suffering himself to be hauled along, he protested, with abundance of noise and vociferation, that it was impossible the gentlemen could have any thing to say to him; while the Englishmen themselves, on the other hand, were encouraging John to come up by all means, professing they only wished to have a little conversation with him. At last our hero made his appearance at the landing-place; and here was another demur. "Such grand gentlemen," with well-feigned awe and astonishment, he declared, "could never hae any thing to say till the like o' him." At last, however, being urged and entreated by the gentlemen, on the one hand, and jogged on by Clirehugh at his elbow, on the other, John did venture into the "presence;" but first stooped down for a hold of the flap of the carpet, which he forthwith began, with much deliberation and humility, to roll before him. "The deuce take the fellow!" exclaimed one of the Englishmen to Clirehugh, on observing this proceeding; "although we wished you to procure us an interview with one of the clowns of your country, we did not intend you should introduce to us an absolute fool." "Dear sir, I'm nae better than a fule, as ye may say; but, anent the carpet, wad ye hae me come into so grand a chaumer, without either rowin' up the claiter, or casting aff my shoon?" "Well, well, John, we won't quarrel with you on that matter; only just sit down now and take a glass of something." This proposal, we may suppose, was to the point, whether addressed to John *in propria persona* or quoad his fictitious character. At last, after some general and desultory conversation, in all of which our hero acquitted himself *à merveille*, and when John was supposed to be, by the aid of an elevating glass, considerably more at his ease, the question was propounded which was to decide the bet; and after an introduction as to what they had heard of the superior education of John's countrymen, it came out in this shape—"Pray, John, can you tell us who was Adam's father?" "Adam's father?" said John, "en, ay; let's see;" then recollecting the catechetical tale he had

learned at school, after a short pause—"Ou, ay; Noah was the son of Lamech, who was the son of Methuselah, who was the son of Enoch, who was the son of Jared, who was the son of Mahalaleel, who was the son of Cainan, who was the son of Enos, who was the son of Seth, who was the son of Adam, who was the son of God."—"Well done!" exclaimed the Englishman; "John, you are a clever fellow, and have gained the bet;" which was perfectly acquiesced in by the other party; neither of whom, by the bye, had any idea of the logical ratiocination which John had brought to bear on the question.

This matter being settled, after the glass had been pushed round pretty swiftly, and our hero had treated the strangers with a great many jokes and shrewd remarks, which raised him still higher in their estimation, he said, "Weel, gentlemen, I dinna ken weel what to say to you for your extraordinary kindness, or how to thank ye; and I maun now be steppin'." But as I hae gotten a gowd guinea frae ye, for answering the bit question ye speird, wad ye no tak it amiss, if I was to speir ane at you, which will no be muckle langer than yer ain; and, as I maun say, ye hae been sae very frank, and haena taen amiss my want o' havins, if ye like I'll pit down my guinea again, for a wad against yours." "Oh, most certainly, John; most certainly; we shall be very glad to answer your question, in place of taking it amiss." "Then," says John, "can ye tell me wha my father was?" "Confound the fellow!" exclaimed both the Englishmen; and it is almost needless to add, that John was permitted to withdraw himself as quickly as he chose, with his three guineas, without being troubled, for that time, with any more questions.—*Scottish Jest and Anecdotes.*

REAL STORY OF JEANY CAMERON.

Mrs JEAN, or as the English insist upon styling her, Mrs Jenny Cameron, is a name of some celebrity, or rather, perhaps, notoriety. She has been the subject of much discourse, both in her own time and in ours. The pamphlets published at the time of the insurrection of 1745 were full of her; nay, we have even seen a kind of novel, in one volume, which had apparently been got up by some gentleman of Grub Street, on that occasion, and in which she acted as the heroine. The generally received notion, both at the time and since, has been, that she accompanied Prince Charles, as his mistress, during the whole of his expedition; and it is on this understanding that Fielding causes his heroine, Sophia, to be mistaken for her at Gloucester. Of late times, another idea has got abroad, namely, that she survived to old age, and went about begging in men's clothes, with a wooden leg; till at length she died in the Edinburgh Infirmary, of an accident which had befallen her on the street. Now, it is very strange, but very true, that Mrs Jean Cameron never saw Prince Charles Stuart in her life, and that she spent the whole of her life in circumstances perfectly respectable.

The real history of this lady is, in its way, a desideratum, and we therefore have no little pleasure in giving it, in the following terms, upon the credit of the late Sir Ewen Cameron of Fassefern (nephew of the gallant Lochiel, and father of the equally gallant Colonel Cameron of the 42d, who fell on the field of Waterloo), who died within the last three years, at the age of ninety.

She was the daughter of Cameron of Glendessery, in Lochaber, who generally resided in Morven, where he had another estate. She was married in early life to an Irish gentleman named O'Neal, and she lived with him for some years in Ireland, till his brutal usage necessitated her to divorce him. She then returned to her own country, and was distinguished by the appellation of Mrs Jean, and sometimes Lady Jean Cameron. At the time of the insurrection she resided in Strontian, where she managed the extensive estates of her brother, Cameron of Dungalton, while he served Prince Charles as an officer. Many more of her relations were engaged in this enterprise, together with about eight hundred petty men who bore her name. No clan, indeed, of equal extent, went so heartily into this adventure as the Camerons. Mrs Jean did what she could for the cause, by sending a large present of cattle to Prince Charles at the time of his raising his standard in Glenfinnan. It is also acknowledged that she made several attempts to see him; but she never was successful. During the whole period of the insurrection she did not leave her own residence in the Highlands. She was a woman of beauty and fashion, of good manners, and possessed a masculine understanding. Her death took place in the year 1774, at her house of Mount Cameron, in Lanarkshire. All these facts we give with the most perfect assurance of their historic truth.

The whole rumour as to this lady having been the mistress of Prince Charles appears to have arisen from some misapprehension. Nothing can be more certain, however, than that the idea was thoroughly rivetted in the public mind. Just about the time when the Highland army was returning into Scotland, a lady who visited Stirling in a coach, was seized by the garrison there as the noted Jean Cameron. It was soon discovered that the lady was a respectable mili-

ner, or mantuamaker, in Edinburgh, who was only at Stirling on a visit, and who had nothing in common with the Prince's supposed mistress except the name. This fact is stated in all the newspapers and magazines of the day. Mrs Cameron herself was one day walking on the High Street of Edinburgh, along with some friends, waiting for a coach, when a boy came up with a lot of loose papers over his arm, which he was proclaiming as a full, true, and particular account of the adventures of Jeany Cameron and Prince Charles Stuart; whereupon she mildly remarked to her friends, what an extraordinary fate hers had been, to be thus universally famed as the mistress of a man whom she had never once seen. As for the one-legged woman in male attire, who latterly affected to be Jeany Cameron, we have ascertained that she was a mere maniac, crazed through Jacobitism, and proud to be considered even the mistress of so glorious a being as the rightful heir of these three kingdoms.

AN INDIAN PAGODA.

A description of a pagoda, or temple of the large class, may not be uninteresting. A high solid wall incloses a large area in the form of an oblong square; at one end is the gateway, above which is raised a large pyramidal tower; its breadth at the base and height proportioned to the magnitude of the pagoda. This tower is ascended by steps in the inside, and divided into stories; the central spaces on each are open, and smaller as the tower rises. The light is seen directly through them, producing at times a very beautiful effect, as when a fine sky or trees form the back-ground. The front, sides, and top of this gateway and tower, are crowded with sculpture; elaborate, but tasteless. A few yards from the gate, on the outside, you often see a lofty octagonal stone pillar, or a square open building, supported by tall columns of stone, with a figure of a bull couchant, sculptured as large, or much larger than life, beneath it. Entering the gateway, you pass into a spacious paved court, in the centre of which stands the inner temple, raised about three feet from the ground, open and supported by numerous stone pillars. An inclosed sanctuary at the far end of this central building contains the idol. Round the whole court runs a large deep verandah, also supported by columns of stone, the front rows of which are often shaped by the sculpture into various sacred animals rampant, ridden by their respective deities. All the other parts of the pagoda, walls, basements, entablatures, are covered with imaginary and ornament of all sizes, in alto or demi-relievo. Here you may see faithfully represented in black granite all the incarnations of Vishnu the Preserver; here Siva the Destroyer, riding on his bull, with a snake twisted round his neck, and a crescent on his head; Krishen, their Apollo, with his flute; Kawadeva, their Cupid, riding on a parrot, with his bow of sugar-cane, strung with flowers, or bees; Ganesa, the god of prudence, with his elephant-head; Surya, the sun, drawn in his chariot by a seven-headed horse; Chandava, the moon, in a car drawn by antelopes; Agnee, the god of fire, riding on a ram; Varoona, the god of the seas, on a crocodile; many female deities and inferior nymphs presiding over seasons, instruments of music, &c., or crowds of warriors on horseback, and the fabulous actions of their superior gods portrayed in groups and pictures of demi-relief every where. Generally in front of the idol, and in other parts of the temple, you see lingaurs on their altars. Near every pagoda is kept a huge wooden car, or rather temple, on wheels. This, also, is curiously carved; but the scenes and figures represented are usually so indecent and unnatural as not to admit of description. At certain seasons, an idol, painted and adorned, is placed on it, and dragged by the united strength of hundreds in procession. Such, though but roughly, and, I fear, not very intelligibly sketched, is a pagoda. Here the worshippers daily resort with their humble offerings of rice and plantains; and, whether on high festivals, they crowd with flowers, fruit, incense, and money, to gaze on groups of dancing girls—beautiful in form, gaudy in attire, and voluptuous in every look and motion; or listen to the wild obscure fictions, sung by religious mendicants to the sound of strange and discordant music; or gather round self-torturing devotees, with frantic shouts of approbation.—*Sketches of India.*

STATE OF FRANCE.

According to Dupin, in his *Forces Productives et Commerciales de la France*, "the division of landed property which has taken place in France within the last thirty years, has produced a more general diffusion of prosperity; it has extended the means of comfort and of health to many families which did not before possess them. While the progress of industry has increased the demand for labour, and raised wages, the improvements made in arts and manufactures have reduced the price of a multitude of useful or agreeable productions, and thus a double melioration has taken place in the condition of the labourer. He is now able to procure better food, better clothes, and better lodging. In most of the provinces of France, those shapeless hovels which afflicted the eye of the traveller have been replaced by substantial houses, well built, well covered, and supplied with better furniture. Thirty years ago, there were in various parts of France a vast number of habitations which received no other light than by holes in the wall, which were either left entirely open, or stuffed with straw. At present there are few of these openings which have not been converted into sashed and glazed windows; and the more constant supply of light thus obtained has contributed to cleanliness, and, of course, to health."

WINES.

Omnia vastatis ergo quum cerneret arvis
Desolata Deus: nobis felicia vini
Dona dedit; tristes hominum quo munere fovit
Reliquias, mundi solatus vite ruinam!

Venerii Præd. Rusticum, lib. xl.

"Drink no longer water, but use a little wine for thy stomach's sake, and thine often infirmities."—*St Paul's First Ep. Tim. v. 23.*

No species of beverage has obtained so respectable an antiquity, and been of such universal appreciation among mankind, as *WINE*. The use of this liquor can indeed be traced up to the earliest ages of the world. We find from the sacred writings that Noah planted a vineyard shortly after the deluge; and a modern Latin poet, exalting the origin of wine in the above quatrain, ingeniously represents the vine as a gift from Heaven, to console mankind for the miseries entailed upon them by that grand catastrophe. I hope my readers will allow me to present them with a brief account of the most celebrated ancient and modern wines, gleaned for their amusement from the best authorities on the subject.

This generous liquor, as is well known, is an expression of the grape, the fruit of the vine, a shrub indigenous to Persia and the Levant, but now found in most temperate regions. From Asia the vine was introduced into Greece, and thence into Italy. The Phœceans, who founded Marseilles, carried the vine into France, in which country and in Portugal it is at present in the most extensive cultivation. There are a great variety of vines; and this circumstance, combined with difference of soil, climate, mode of preparation, &c., has occasioned an extreme variety in the different species of wine. But even between places immediately contiguous to each other, and where a cursory observer would hardly remark any difference, the qualities of the wines, though produced by the same species of grape, and treated in the same way, are often very different. A great deal evidently depends on the aspect of the vineyard; and it is probable that a good deal depends on the peculiarities of soil, while not a little also depends on the management of the vintage. Thus, for a brisk wine, the grapes are gathered before they are perfectly ripe; for a dry, as soon as they have acquired their proper maturity; and if a sweet wine be desired, the gathering is postponed to the latest period. Dry and clear weather is generally chosen for the vintage; but the best brisk Champagne is made from the grapes that are collected during a fog or before the dew that has settled on the vines is dispersed. Thoroughness of wines depends, in some degree, on the circumstance of the stalks of the grapes being added or excluded. In the preparation of port, I believe, they are always used, but in the manufacture of the more delicate red wines of Bourdeaux they are generally excluded. With regard to colour, this is derived from the skin of the grape; for the juice of red or black grapes, with the exception of the *Tantilla* grape, the pulp of which is coloured, yields as colourless a wine as that procured from white grapes, when it is fermented without the hulls.

The earliest of the Greek wines was the Maronean, a sweet black wine, which Homer describes as "rich, unadulterate, and fit for the gods," and as so potent, that it was usually mixed with twenty measures of water. Nearly of equal antiquity was the Pramnian, a strong, hard, astringent, red wine, from the island of Icarus. It resembled our port wine, like which also it was often used medicinally, and on that account was sometimes called *pharmaceutic*. The best Greek wines, however, and those in which they surpassed all other nations, were the luscious sweet wines, the products of the Ionian and Ægean seas, particularly Lesbos, Chios, and Thasos. They were wines of a pale amber colour, with much odour and a high flavour. The Phœnean, which is extolled by Virgil as the king of wines, was from Chios. The lighter wines were the Mendean, the Argitis, and the Omphacites; but the Greeks were also acquainted with the African and Asiatic wines, several of which were in high reputation. The Buthnian wines were of the choicest quality; the wines of Byblos, in Phœnicia, on the other hand, vied in fragrance with the Lesbian; and if confidence is to be placed in the report of Athenæus, the white wines of Marceitis and Tania in Lower Egypt, were of almost unrivalled excellence. The former, which was sometimes called the Alexandrian, from the neighbouring territory, was a light, sweetish, white wine, with a delicate perfume, of easy digestion, and not apt to affect the head; though the allusion of Horace, to its influence on the mind of Cleopatra, would seem to imply that it had not always preserved its innocuous quality. The wine of Merôe, however, which was produced at the feast given to Cæsar by that voluptuous female, would appear to have been in still higher estimation.

The wines of ancient Italy were more celebrated than those of Greece. The choicest of the Roman wines were the Massic and Falernian, besides which there were many wines of an inferior quality, but in all of which the Roman citizens in the upper ranks indulged with great freedom at their expensive public and private feasts. No wine has ever acquired such extensive celebrity as the Falernian, or more truly merited the name of 'immortal,' which classic writers have conferred upon it. All writers agree in describing the Falernian wine as very strong and durable, and so rough in its recent state, that it could not be drunk with pleasure, but required to be kept a great number of years before it was sufficiently mellow. Horace terms it a 'fiery' wine, and calls for water from the spring to moderate its strength. From Galen's account, it appears to have been in best condition from the tenth to the twentieth year; and afterwards it was apt to contract an unpleasant bitterness, especially if not preserved in glass bottles. Horace, who was a lover of old wine, proposes, in a well-known Ode, to broach an amphora, or jar, which was coeval with himself, and which, therefore, was probably not less than thirty-six years old. It will be remembered by some of my readers, that on one occasion Cicero having supped with Damasippus, he had some indifferent wine presented to him, which he was pressed to drink, as being Falernian, forty years old; and that, on tasting it, he pleasantly observed, that it bore its age uncommonly well! It is the opinion of Dr Henderson, who has written a history of wines, that Xeres and Madeira wines may be fixed upon as the two to which the Falernian offers the most distinct features of resemblance. Both are straw-coloured wines, assuming a deeper tint from age, or from particular circumstances in the quality or management of the vintage. Both of them present the several varieties of dry, sweet, and light. Both of them are exceedingly strong and durable wines; being,

when new, very rough, harsh, and fiery, and requiring to be kept about the same length of time as the Falernian, before they attain a due degree of mellowness. This celebrated Roman wine was the produce of the Campagna Felice, which possesses a soil analogous to that of the island of Madeira. In preparing their wines, the ancients often inspissated them till they became of the consistence of honey, or even thicker. These were diluted with water previously to their being drunk; and indeed the habit of mixing wine with water seems to have prevailed much more in antiquity than in modern times.

The best wines of France are those produced in Champagne, Burgundy, Dauphiny, and the Bordelais; Languedoc and Roussillon also produce wines in considerable quantity, but they are reckoned inferior. The wines of Champagne are commonly divided, following a distinction occurring as early as the ninth century, into River wines—*Vins de la Rivièrre de Marne*, which are for the most part white; and Mountain wines—*Vins de la Montagne de Reims*, which are red. The former are mostly brisk or sparkling wines, and distinguished by their delicate flavour and aroma. But the brisk wines are not always the best; and unless they are very strong, much of the alcohol is carried off with the carbonic acid gas which occasions the froth. Hence the slightly frothing wines—*cremans*, or *demi-mousseux*, are preferred by persons of *haut goût*. Sillery, which has obtained its name from the vineyards which yield it, holds the first rank among the white wines of Champagne. It was brought into vogue by the peculiar care bestowed on the manufacture of it by the *Marchale d'Estrees*, and was long known by the name of *Vin de la Marchale*; and has always been much in request in England. The most celebrated of the river wines, strictly so called, is that of Ay. Of the Reims mountain wines, those of Verzy, Verzenay, Mailly, Bouzy and St Basle, are most esteemed. But the Clos St Thierry furnishes the only red wine that can be said to unite the rich colour and aroma of Burgundy with the delicate lightness of Champagne.

The choicest of the Burgundy wines—for which the Dukes of Burgundy deservedly merit their ancient designation of "*princes des bons vins*"—is that of Romanée-Conti, a wine scarcely known in England, and produced in small quantities only; the vineyard being not more than six and a half English acres in extent. Chambertin, another Burgundy wine, almost rivals Romanée-Conti. It was the favourite wine of Louis XIV., and of Napoleon. It is the produce of a vineyard of that name, situated seven miles to the south of Dijon, and furnishing each year from 130 to 150 puncheons, from an extent of about 65 acres. Chambertin wine is of a full body and colour. The next was that of the Clos Vougeot, when that small domain was the property of the Church; but it is now considered as the third or fourth growth, and is surpassed by those of Romanée de St Vivant, Mosigny, Clos de Premeau, and some others. Under the name Mâcon, which is the red Burgundy best known in England, are comprehended not only the growths of the Mâconnaise, but also the chief wines of the Beaujolais, forming part of the department of the Rhone. These wines are all red; but the white wines of Burgundy, although less known than the red, maintain the highest rank among the French white wines. The best is the Mont Rachet wine, famous for its high perfume and agreeable nutty flavour; but there are three varieties of it, *ami*, *chevalier*, and *bataud Mont Rachet*, the last of which sells, or used to sell, for only one-third of the price of the first.

The wines of Dauphiny are among the most ancient in France; but the celebrity of some of them, the Condrieux, the Hermitage, and the Côte Rotie, is of very ancient date. The hermitage, which derives its name from the ruins of a hermitage on the rock on which the vineyard is situated, is both red and white; the former being the production of the *siras* and the latter that of the *marcasse* and *rousanne* grapes. The Côte Rotie resembles the hermitage in flavour and perfume; and the department of Vaucluse furnishes a few growths analogous to both, but inferior in quality. Dauphiny yields also a luscious wine, resembling the best Constantia. It is made from the richest grapes, which are hung up or spread upon straw for six or eight weeks, or until they become half-dried, from which circumstance the liquor obtained from them is named "Straw Wine," or *Vin de paille*.

The wines of Languedoc, Provence, and Roussillon, are superior only in the class of sweet wines. The wines of Travel, Chuzclan, St Geniez, Lirac, and St Laurence, are the best of the red wines of Languedoc. They have a bright rose tint. The red wines of Roussillon are the strongest and most durable that France produces; the choicest are those of Bagnols, Cosperou, and Colloure. The wines of Provence are of very ordinary quality. Among the dry white wines of these districts are the Rivesaltes and the Frontignac. The wines of Gascony and Guienne are better known by name in England than any other of those of the French vineyards; the names Lafite, Grave, Château, Margaux, Sauterne, and Barsac, being familiar to most ears on this side of the Channel; yet these wines are understood to be seldom seen on the table in this country, owing to the various processes to which they are subjected by the merchants of Bourdeaux, in adapting them for the English market. Thus we drink an artificial wine called *Claret*, which is made up by adding to each hoghead of Bourdeaux wine three or four gallons of Alicante, or Benicarlo, half a gallon of stum wine, and sometimes a small quantity of hermitage. This mixture undergoes a slight fermentation; and when the whole is sufficiently fretted in, it is exported under the name of claret.

The wines of Spain are distinguished by high flavour, aroma, strength, and durability; but, from the mismanagement of the fermentation, the red wines in particular are dull and heavy on the palate; and, except in dry white wines, none of the Spanish wines will bear comparison with the more delicate growths of France. The most perfect are the produce of Xeres, from which our *Sherry* takes its name. The Spanish wines, when not exported, are stored in skins smeared with pitch, which gives them a peculiar and disagreeable taste, called the *oler de bota*, and renders them more liable to become muddy. The principal vineyards at Xeres are in the hands of British and French settlers, and to these the great improvement, of late years, in the manufacture of sherry, is attributed. In making this wine, red and white grapes are used indiscriminately, and dried to a certain extent before they are pressed. The fermentation is allowed to be continued from October till the middle of December, before it is racked from the lees; and that intended for exportation receives a certain proportion of brandy, which seldom exceeds three or four gallons to the butt. The nutty flavour, so highly prized in this country, is produced by infusing bitter almonds in the wine. Good sherry is of a deep amber colour,

and has a fine aromatic odour; its taste is warm, with some degree of agreeable bitterness. When new, it tastes harsh and fiery; it is mellowed by being allowed to remain four or five years or longer in the wood; but it does not attain to its full flavour and perfection until it is kept fifteen or twenty years. It is a very strong wine, containing about 19 per cent. of alcohol. Perhaps no wine is so much adulterated as sherry. Its consumption is very large, amounting to above 2,000,000 of imperial gallons.

In Portugal, the principal wine district is the province of Upper Douro, in which port wine is grown to a great extent, and shipped at Oporto, whence its name. Besides the Douro, other districts in Portugal supply wine. The growths of Alenquer, Torres Vedras, Lamego, and Mogaon, furnish wines resembling the second growths of the Bordelais. The Colares port, which is grown near Cintra, is the only one which has found its way to this country. Bucellas, Setuval, and Carcavellos, are the best of the Portuguese white wines. To return to port. When this respectable and substantial liquor arrives in this country, it is of a dark purple or inky colour, has a full rough body, with an astringent bitter sweet taste, and a strong flavour or odour of brandy. After it has remained some years longer in the wood, the sweetness, roughness, and astringency of the flavour abate; but it is only after it has been kept ten or twelve years in bottle, that the odour of the brandy is completely subdued, and the genuine aroma of the wine developed. When kept to too great an age, it becomes tawny, and loses its peculiar flavour. During the process of mellioration, a considerable portion of the extractive and colouring matter is precipitated on the sides of the vessels in the form of crust. In some wines this change occurs much earlier than in others. A large quantity of brandy is always mixed with the wine shipped from Oporto to England. Genuine unmixed port wine is very rarely met with in this country. We have been so long accustomed to the compounded article, that, were it possible to procure it unmixed, it is doubtful whether it would be at all suited to our taste. According to Mr Brande's analysis, port wine, as used in England, contains about 23 per cent. of alcohol; consequently, nearly the fourth part of every glassful is pure spirit. It should, however, be observed, that this proportion of spirit is not injurious, as the other matter in the wine neutralizes its effects. In purchasing good port, as in other liquors, a very great deal depends on the respectability of character of the merchant. The quality is understood to be injured previous to its shipment, in consequence of a monopoly long enjoyed by an association, called the Oporto Wine Company, under the auspices of the Portuguese government. The quantity of port shipped annually from Oporto to Britain, amounts to above 20,000 pipes, or above 2,300,000 imperial gallons, being about the same quantity that is used of sherry.

The wines of Italy and Greece are but little imported into England. They are, without a single exception, in all respects very inferior to those of France. The natives of Italy bestow no care upon the culture of the vine; and their ignorance, obstinacy, and want of skill in the preparation of wine, are said to be almost incredible. In some districts the art is, no doubt, better understood than in others; but had the Falernian, Cecuban, and other famous ancient wines, not been incomparably better than the best of those that are now produced, they never would have elicited the glowing panegyrics of Horace.

Madiera wines, the produce of the island of that name, have long been in extensive use in this country. There is a considerable difference in the flavour and other qualities of the wines of Madeira. The best are produced on the south side of the island. Though naturally strong, they receive an addition of brandy when racked from the vessel in which they have been fermented, and another portion is thrown in previously to their exportation. This is said to be required to sustain the wine in high temperature, to which it is subjected in its passage to and from India and China, to which large quantities of it are sent; it being found that it is mellowed, and its flavour materially improved, by the voyage. Madeira wines may be kept for a very long period. Indeed, they cannot be pronounced in condition until they have been kept ten years in the wood, and afterwards allowed to mellow nearly twice that time in bottle; and even then they will hardly have reached the utmost perfection of which they are susceptible. The Madeira wines unite great strength and richness of flavour with an exceedingly fragrant and diffusible aroma; they have latterly fallen into disrepute in England. The growth of the island is very limited, not exceeding 20,000 pipes, of which a considerable quantity goes to the West Indies and America. Hence, every sort of deception was practised with respect to it, and large quantities of spurious trash were disposed of for the genuine vintage of the island. This naturally brought the wine into discredit; so that sherry has for several years been the fashionable white wine. Malmsey, a very rich luscious species of the Madeira, is made from grapes grown on the rocky grounds exposed to the full influence of the sun's rays, and allowed to remain in the vine till they are over ripe.

Teneriffe wine, the produce of the island of Teneriffe, is used to a moderate extent in England. It resembles Madeira, and is not unfrequently substituted in its place; but it wants the full body and rich flavour of the best growths of Madeira.

The wines of Germany imported into England are principally produced on the banks of the Rhine and the Moselle. The Rhine wines constitute a distinct order of themselves. They are drier than the French white wines, and are characterised by a delicate flavour and aroma, quite peculiar, and which would be reckoned *sourness* by the uninitiated. The vineyards of Johannisberg, Steinberg, and Grafenberg, yield the choicest vintage on the Rhine. The hock, or hocheimer, is a Mayn wine. In the Austrian states, the wines are almost all of an inferior quality, being sharp and often entirely acid. Tokay is a Hungarian wine, and is merely the juice which exudes from the half-dried grapes by the pressure of their own weight. It is luscious, and at the same time possessing a high degree of flavour and aroma.

Of the remaining wines imported into England, those of the Cape of Good Hope form the largest proportion; the quantity annually entered for home consumption being about 540,000 imperial gallons. The famous Constantia wine is the produce of two contiguous farms of that name, at the base of the Table Mountain, between eight and nine miles from Cape Town. Cape wines are all inferior in quality to those produced in Europe; some are indeed execrable, but being admitted at half the duty of other wines, they are largely imported as a menstruum for adulterating and degrading sherry, to which they bear

a resemblance. In cookery, Cape wines, from their cheapness, are also sometimes used instead of sherry.

The total amount of wines of every description used annually in the United Kingdom, is about 7,000,000 of imperial gallons, from which the government derives a duty of about £1,500,000.

In former times the chief and most fashionable wine drunk in 'Merry England' seems to have been Canary, a "stoup" of which cheering liquor mingles in all our descriptions of the "olden time." Canary wine, the produce of the Canary Islands, is now little heard of, being almost as obsolete as Sack. With regard to the last-mentioned wine, which has been immortalised by Shakespeare, little is satisfactorily known. It has been ascertained that the wines called Sacks were imported from Spain, and that the name is derived from *sec*, signifying dry. We are informed by Venner that "Sacke is completely hot in the third degree, and of thin parts, and therefore it doth vehemently and quickly heat the body." This description accords with the epithet "sprightly," usually bestowed on it by the old writers, some of whom extol it as "the elixir of wines." Falstaff complained that there was time in his Sack, which has been thought to allude merely to the adulteration of Sack by the vintners, but, in fact, it throws much light on its genuine qualities, and proves it to be of the same nature as the wines still manufactured in Spain and other countries, from the ripest grapes, which receive a sprinkling of gypsum, or burnt lime, before they are pressed and introduced into the vat. Of Sacks there were different species, as Canary-sack, Palm-sack, and Malaga-sack, &c. Sacks of all kinds are now among the liquors which have been; and, alas, "we ne'er shall look upon their like again."

THE BLUFF MUTTONEER.

Tantus amor ovio, atque gloria!

VIRGIL.

Definition.—MUTTONEER is a term founded upon the word BUCCANEER, and is used to denote a man who is constantly going about seeking what he may devour in the way of good mutton; pursuing this end with all the pertinacity and eagerness with which a buccaneer follows the small craft which he makes his prey, and scarcely to be turned aside from his purpose by any ordinary obstruction.

You may talk of your dandies, your bloods, and fine fellows,
And of all the gay creatures of Princes' Street tell us;
But in my estimation there's none that can peer
With that jolly good fellow, the Bluff Muttoneer.

Derry down, down, down derry down.

The Bluff Muttoneer! would you have him before ye,
In all his majestic proportions and glory?
Do you wish that the genuine man should appear?
Then look, and I'll show you the Bluff Muttoneer.

Derry down, &c.

More sturdy than tall, to the fat just inclining;
A belly whose jet shows some good capon lined;
A swell arriere, over which dangle clear
The gauzy coat-tails of the Bluff Muttoneer

Derry down, &c.

A visage as broad and as bright as the moon,
When she rises in autumn nine nights alike soon;
And like her when half-risen, half-hid, you would swear,
In the web round the neck of the Bluff Muttoneer.

Derry down, &c.

A hat o'er this visage cocks somewhat aje,
As it was in the year eighteen hundred and three;
A mouth for a jeer and an eye for a leer,
And a cane in the hand of the Bluff Muttoneer.

Derry down, &c.

And then of the causeway he walks on the crown,
With a sough on the air, would knock any man down;
My faith, ye had better take care how ye steer,
When ye come near the track of the Bluff Muttoneer.

Derry down, &c.

For every thing's big 'bout this wonderful blade,
His look is a stare, and his voice a cascade;
Ye had better shake hands wi' a Spitzbergen bear,
Or with a smith's vice, than a Bluff Muttoneer.

Derry down, &c.

Yet the Bluff Muttoneer has his softnesses too;
To the friends of his heart he's both kindly and true;
And good wether mutton he holds very dear,
And he's had his attachments—the Bluff Muttoneer.

Derry down, &c.

On port, now, and mutton, are placed his affections,
And for meaner things he has few predilections;
That he still "likes the gals," he sometimes will swear,
But it's all to no good with the Bluff Muttoneer,

Derry down, &c.

Should you ask him to dine, yet, forgetting his taste,
Give him only some kickshaws surrounded with paste;
Alas, my good friend, they'd be viewed with a sneer,
Being nought in the hands of a Bluff Muttoneer,

Derry down, &c.

In case such an error you e'er should commit,
I'll tell you what things will his appetite hit,
So that you may invite him without any fear
Of affronting—and starving the Bluff Muttoneer.

Derry down, &c.

First have a good jigot—be sure it's a wether—
Five-year-old—Teviot-fed—and a smack of the heather
A glass of good sherry—a glass of good beer—
Then port, at the will of the Bluff Muttoneer,

Derry down, &c.

See him planted at table with knife and with fork,
With what practised adroitness he gets through his work!
How he knows when the moment of gorging is near,
And fills to a hair-breadth—the Bluff Muttoneer.

Derry down, &c.

With what constitutional horror he sees
Fellows keeping a corner for pancakes or cheese!
Such vile disregard of the principal cheer
Seems treason—or worse—to the Bluff Muttoneer.

Derry down, &c.

After dinner he talks of some Jockey Club case,
Or what yesternight at the *Shakie** took place!
Or he sings them a song with his whistle so clear,
"If they'll join in the chorus"—the Bluff Muttoneer.

Derry down, &c.

His songs are the songs of his own early day,
"Dear Tom, this brown jug," or, "In Trafalgar Bay,"
Such things as "Young Love," or the "Calm Bendemeer,"
Are all to de rol with the Bluff Muttoneer.

Derry down, &c.

When at nine the young men make a move from their chairs,
And say something 'bout joining the ladies up stairs,
He gives them a look that their livers might spear,
And "the more I won't come," thinks the Bluff Muttoneer.

Derry down, &c.

At length when the time has roll'd on to eleven,
He ends with a glee—"To Anacore in Heaven!"
And beginning to feel rather muzzy and queer,
Home staggers in glory the Bluff Muttoneer!

Derry down, &c.

* A house which formerly existed under the name of Shakespeare's Tavern, near the Theatre-Royal, Edinburgh—a great house

—"in the year eighteen hundred and three."

THE VENETIAN OLIGARCHY.

The senate of Venice, which made it a rule never to defend the republic but by foreign arms—never to enlist its citizens under its banners either as generals or soldiers—further observed that of governing with extreme rigour those foreign adventurers of whom its armies were composed, and of never believing in the virtue of men who trafficked in their own blood. The Venetians distrusted them: they supposed them ever disposed to treachery; and if they were unfortunate, though only from imprudence, they rendered them responsible. The condottieri were made fully to understand that they were not to lose the armies of the republic without answering for the event with their lives. The senate joined to this rigorous the perfidy and mystery which characterise an aristocracy. Having decided on punishing Carmagnola for the late disasters, it began by deceiving him. He was loaded with marks of deference and confidence: he was invited to come to Venice in the month of April 1432, to fix with the signoria the plan of the ensuing campaign. The most distinguished senators went to meet him, and conduct him to the palace of the doge. Carmagnola, introduced into the senate, was placed in the chair of honour: he was pressed to speak, and his discourse applauded. The day began to close; lights were not yet called for, and the General could no longer distinguish the face of those who surrounded him; when suddenly the *Sbirri*, or soldiers of police, threw themselves on him, loaded him with chains, and dragged him to the prison of the palace. He was next day put to the torture, rendered still more painful by the wounds which he had received in the service of this ungrateful republic. Both the accusations made against him, and the answers he made to the questions, are buried in the profound secrecy with which the Venetian senate covered all its acts. On the 5th of May 1432, Francesco Carmagnola, twenty days after his arrest, was led out, his mouth gagged, to prevent any protestation of innocence, and placed between the two columns on the square of St Mark: he was there beheaded, amidst a trembling people, whom the senate of Venice was resolved to govern only by terror.—*Sismondi*.

BEAVERS.

Such is the sagacity of the beavers, that a tribe of American Indians consider them as a fallen race of human beings, who, in consequence of their wickedness, vexed the Good spirit, and were condemned by him to their present shape, but that in due time they will be restored to their humanity. They allege that the beavers have the power of speech, and that they have heard them talk with each other, and seen them sitting in council on an offending member. The lovers of natural history are already well acquainted with the surprising sagacity of these wonderful animals, with their dexterity in cutting down trees, their skill in constructing their houses, and their foresight in collecting and storing provisions sufficient to last them during the winter months; but few are aware I should imagine, of a remarkable custom among them, which, more than any other, confirms the Indians in believing them a fallen race. Towards the latter end of autumn, a certain number, varying from twenty to thirty, assemble for the purpose of building their winter habitations. They immediately commence cutting down trees; and nothing can be more wonderful than the skill and patience which they manifest in this laborious undertaking. To see them anxiously coking up, watching the leaning of the tree when the trunk is nearly severed, and when its creaking announces its approaching fall, to observe them scampering off in all directions to avoid being crushed. When the tree is prostrate, they quickly strip it of its branches; after which, with their dental chisels, they divide the trunk into several pieces of equal lengths, which they roll to the rivulet across which they intend to erect their house. Two or three old ones generally superintend the others, and it is no unusual sight to see them beating those who exhibit any symptoms of laziness; should, however, any fellow be incorrigible, and persist in refusing to work, he is driven unanimously by the whole tribe to seek shelter and provisions elsewhere. These outlaws are, therefore, obliged to pass a miserable winter, half-starved in a burrow on the banks of some stream, where they are easily trapped. The Indians call them "lazy beaver," and their fur is not half so valuable as that of the other animals, whose persevering industry and *prévoyance* secure them provisions and a comfortable shelter during the winter.—*Rose Cor's Colombia*.

GARDENING.—MAY.

FRUIT GARDEN.—Thin out the young fruit of apricots, leaving double the quantity intended for the crop. Disbud all sorts of fruit trees against walls, except figs, from forenoon and side shoots, which are not required, and, where long enough, train the rest to the wall. Espalier trees must be looked over in the same manner. All curled and blistered leaves of peaches and nectarines should be picked off and burned, without suffering them to fall on the ground, and the trees washed over by the engine after the middle of the day, but not so late as to prevent the trees getting dry before sunset. If the trees are much infected with insects, and mildew appear, dust the young shoots and leaves with flour of sulphur. Strawberry buds should now be covered between the plants with short grass or straw, in order to keep the surface moist, and the fruit from being soiled by heavy rains. Thin grapes in the stove forcing house, or vinery.

KITCHEN-GARDEN.—Continue hot-beds for cucumbers and melons. Sow seeds of cucumbers under hand-glasses, and ridge out those which were sown last month, to come in for the first hand-glass crop. Sow Cape broccoli, garden and kidney beans, lettuces, peas, spinach, and turnips. Plant out love-apples against walls, poles, or banks; prick out celery, and thin out cardoons. Hoe out carrots, leeks, onions, parsnips, and turnips. Transplant cauliflowers from frames and hand-glasses, and plant out winter greens.—*Lindley's Guide*.

PARENTAGE OF ROBERT BRUCE.

This great man—the saviour of Scottish independence at a most dangerous crisis—was the son of Bruce, Lord of Annandale, by a lady who was Countess of Carrick in her own right. It appears that the first acquaintance of his parents and their subsequent marriage took place through fortuitous circumstances, so that his existence, and consequently the independence of his country, may be said to have depended upon mere accident. The particulars are thus related by Mr P. F. Tytler, in his late work entitled "Scottish Worthies," published as part of Murray's Family Library:—"It appears that a short time after his return from the crusade, Bruce was riding through the beautiful domains of Turnberry Castle, the property of the widowed Countess of Carrick, who, in consequence of the death of her husband, had become a ward of the crown. The noble baron, however, if we may believe an ancient historian, cannot be accused of having visited Turnberry with any view of throwing himself in the way of the Countess of Carrick; and, indeed, any such idea in those days of jealous wardship would have been highly dangerous. It happened, however, that the lady herself, whose ardent and impetuous temper was not much in love with the seclusion of a feudal castle, had come out to take the diversion of the chase, accompanied by her women, huntsmen, and falconers; and this gay cavalcade came suddenly upon Bruce, as he pursued his way through the forest alone and unarmed. The Knight would have spurred his horse forward, and avoided the encounter, but he found himself surrounded by the attendants; and the Countess herself riding up, and, with gentle violence, taking hold of the horse's reins, reproached him in so sweet a tone for his want of gallantry in flying from a lady's castle, that Bruce, enamoured of her beauty, forgot the risk which he run, and suffered himself to be led away in a kind of triumph to Turnberry. He here remained for fifteen days, and the adventure concluded, as might have been anticipated, by his privately marrying the youthful countess, without having obtained the concurrence of the king or any of her relations. Alexander III., however, although at first indignant at this bold interference with the rights of the crown, was a benevolent prince, and on the payment of a large feudal fine, extended his forgiveness to Bruce. The eldest son of this marriage of sudden and romantic love was Robert Bruce the younger, Earl of Carrick, and afterwards King of Scotland. The second was Edward Bruce, Lord of Galloway, who was crowned king of Ireland in 1316; and besides this regal issue, the Countess of Carrick, who appears to have proved a faithful and affectionate wife, bore her husband three more sons and seven daughters."

A REVOLUTION ANECDOTE.

Gilbert Elliot of Craighend, and afterwards of Minto and Headshaw, ancestor to the ennobled family of Minto, was a "writer" in Edinburgh towards the end of the seventeenth century. In that capacity, he was of such service to the Rev. William Veitch, a persecuted Presbyterian clergyman, as to save his life. The eclat which he acquired by this event brought him into favour and practice. He afterwards became an advocate, and, subsequent to the revolution, was raised to the bench under the designation of Lord Minto. When Lord Minto visited Dumfries, of which Mr Veitch was minister after the revolution, he always spent some time with his old friend; and their conversation often turned on the perils of their former life. On these occasions his Lordship was accustomed facetiously to say, "Ah! Willie, Willie, had it not been for me the pyets had been picking your paw on the Nether-Bow Port;" to which Veitch replied, "Ah! Gibbie, Gibbie, had it not been for me, ye would hae been yet writing papers for a plack the page."

EDINBURGH CHAMBERS JOURNAL

PRICE THREE HALFPENCE.

CULTIVATIONS.

ALL men are not agriculturists, horticulturists, or arboriculturists; but yet almost all men are *cultivators*. By this it is meant that men in general cultivate, or coax, or unduly appreciate and fandle, some particular feature of their persons, or else, perhaps, some integument connected with their persons, to such a degree as to be rather conspicuous, while to every thing else they only give the ordinary degree of attention. There are many features of human nature which remain to be detected and described; and this is one—*Cultivations*. So far as I am aware, no one ever thought of pointing it out to mankind; the subject of cultivation has hitherto remained totally *uncultivated*. So it shall be no longer.

Hair, as the only part of the person which actually grows like a vegetable, is naturally a large subject of cultivation. The Cavaliers long ago cultivated love-locks, which they kept hanging down in graceful fashion from their temples. These locks, or curls, are now changed for tufts or bunches of hair, which the young men cultivate at the same place, and are ever shaking up and tedding, exactly as if it were a crop of hay instead of hair. Mark a modern beau as he walks along the street, and you will observe at one glance that the principal part of the man—the heart—the sensorium—the cynosure—the point from which all the rest evolves—the root of the man, in short, is the tuft under the right rim of his hat. All the rest of him is a mere pendulum, vibrating from this axis. As he walks along, he hardly feels that any other part of him is in existence, besides that. But he feels his tuft most intensely. Thought, feeling, every thing, lies concentrated in that; head, body, and limbs, are all alike mere members devolved from it. If you were to cut off the side-bunch of a modern beau in his sleep, he would, for the time, be utterly ruined. If would be like the polypus, deprived of every thing but a single leg; and he would require several months of dormant-existence—that is, retirement from the streets—to let the better part of him grow out again from the worse, which had remained behind. Let not the demure Puritan, however, think that the joke lies all against the gay cavalier or beau. There may be as much of the sin of cultivation in the stroked and glossy hair of the Roundhead or *plain man*, as in the love-locks and bunches of their antipodes in sentiment. I have seen some men, who affected to be very unaffected, cultivate a peak on the top and centre of their brows as sedulously, and with as much inward gratulation on account of it, as ever I saw a dandy cultivate a tuft, or train a side-curl. It must be understood that there are cultivations of a negative character, as well as of a positive, and he who is guiltless of cultivation in his heart is alone guiltless. Next to curls stand whiskers. What a field of cultivation have we there! The whisker is a bounty of nature, which man does not like to refuse taking advantage of. The thing presses upon him—it is *there*; and to put it altogether aside, except upon the demand of temporary fashion, is scarcely to be thought of. Some men, however, are more able to resist the demon of whiskers than others. There are some men so prone to the temptations of this fiend, that they enlarge and enlarge their field of cultivation, by small and imperceptible degrees, till at length the whole chin falls a prey, excepting, perhaps, a small bit about the mouth, just enough to preserve the cultivator within the pale of the Christian church. Sometimes the Whisker Fiend makes an insidious advance or sally up towards the corners of the mouth;

and there—in those small creeks or promontories—does the sin of cultivation invariably flourish more proud and rampant than anywhere else. The whisker of the cheek is a broad, honest, candid, downright cultivation; but that down about the corners of the mouth is a sly and most impish one—a little pet sin, apt to beset its cultivator in a far less resistible fashion than any other; and it may, indeed, be said that he who has given himself fairly up to this crime is almost beyond redemption.

There are some men who cultivate white hands, with long fair nails. For nothing else do they care very particularly—all is well, if only their hands be neat. There is even a ridiculous notion that elegant hands are the most unequivocal test of what is called good birth. I can say, for my own part, that the finest hands I ever saw belonged to a woman who kept a butcher's shop in Musselburgh. So much for the nonsense about fine hands. Then there is a set of people who cultivate a ring on a particular finger—evidently regretting, from their manner of managing it, that the South Sea fashion of wearing such ornaments in the nose has not ever come into this country. Some men cultivate neat ebony canes with golden heads, which, they tell you, cost a guinea. Some cultivate a lip. A few, who fall under the denomination of stout gentlemen, rejoice in a respectable swell of the haunch, with three wrinkles of the coat lying upon it in majestic repose. Some cultivate a neckcloth—some a shirt breast—some a jewelled pin, with a lesser pin at a little distance, which serves to it as a kind of anchor. There has also of late been a great fashion of cultivating chains about the waistcoat. Some only show about two inches of a gold or silver one between the buttons and the pocket; others, less modest, have themselves almost laced round and round with this kind of tracery. There is also to be detected, occasionally, a small patch of cultivation in the shape of a curious watch-key or seal, which depends from part of the chain, and is evidently a great pet. A not uncommon subject of cultivation is a gold watch.

In our time we have known some men whose taste for cultivation descended so low as the very foot: they took a pleasure in a particular jet of the trouser at the bottom, where it joined the shoe. Then there is a class who cultivate silk umbrellas. It is a prevalent idea among many men that a silk umbrella is an exceedingly *genteel* thing. They therefore have an article of this kind, which they are always carrying in a neat careful manner, so as to show that it is silk. They seem to feel as if they thought all right when they have their silk umbrella in their hand: it is a kind of patent of respectability. With a silk umbrella, they could meet the highest personages in the land and not be abashed. A silk umbrella is, indeed, a thing of such vast effect, that they would be content to go in humble guise in every other respect, provided they only had this saving clause to protect them. Nay, it is not too much to suppose them entertaining this belief—that five-and-twenty shillings put forth on a good silk umbrella produces as much value, in dignity, as five pounds spent upon good broad cloth. How some men do fondle and cultivate silk umbrellas!

There is a species of cultivators who may, in some cases, be very respectable, and entitled to our forbearance, but are, in others, worthy of a little ridicule. I mean the health-seekers; the men who go out at five in the morning to cultivate an appetite, and regularly chill every sharp-set evening party they attend, by sitting like Melancholy retired, ostentatiously insisting that they "never take supper." When a health-seeker takes a walk, he keeps his coat wide open, his

vest half open—seems, in short, to woo the contact of the air—and evidently regrets very much that he cannot enjoy it in the manner of a bath. As he proceeds, he consumes air, as a steam-boat consumes coal; insomuch that, when he leaves the place, you would actually think the atmosphere has a fatigued and exhausted look, as if the whole oxygen had been absorbed to supply his individual necessities. Wherever this man goes, the wind rises behind him, by reason of the vacuum which he has produced. He puffs, pants, fights, strives, struggles for health. When he returns from his morning walk, he first looks in the glass, to congratulate himself on the bloom which he has been cultivating in his cheek, and thereafter sits down to solace the appetite which he finds he has nursed into a kind of fury. At any ordinary time, he could spring from his bed at nine o'clock, and devour four cups of tea, with bread, ham, eggs, and haddocks, beyond reckoning. But he thinks it necessary to walk four hours, for the purpose of enabling himself to take eight cups, and a still more unconscionable proportion of bread, ham, eggs, and haddocks. He may be compared, in some measure, to the fat oxen which are sometimes shewn about as wonders, though apparently there is nothing less wonderful, the obvious natural means being taken. These oxen, if left to themselves in a good park, would become very respectable oxen—a little *en-bon-point*, perhaps, but no more. But, being treated otherwise, they are rendered unnecessarily fat and unwieldy; and so it is with the appetite of the health cultivator.

CULTIVATIONS, it will thus be observed, is a subject of vast extent, and of great importance, not only to the landed interest, but to all the other interests of the country. I should be glad to treat it at full length in a separate volume, for which, I doubt not, ample materials might be found. But I must content myself with giving it in the mean time only a kind of *topping*, as the farmers say; and perhaps I may return to it next *harvest*.

VICISSITUDES OF THE EARTH.

No study can be more universally interesting than that which leads us to an acquaintance with the changes our earth has undergone in past ages. If it be possible to ascertain the order of those changes, and the probable periods in which they were effected, it is clear that we may form a complete history of the planet we inhabit, for the entire period necessary to produce the appearances within reach of examination, as well as to infer, with something like certainty, the course of future revolutions. With respect to the origin of the materials composing the globe, science and observation can give us no information. But the vicissitudes to which they have been subjected, and the agents which have been most energetic in operating these vicissitudes, we can easily explore, with the certainty of acquiring information more and more accurate as we prosecute the investigation.

The science which employs itself in this task is called GEOLOGY, or the study of the structure of the earth. A system, which would account for the original birth and organization of the globe, is called *Cosmogony*; but no system of this nature can be more than a series of guesses strung together in some plausible order, or an hypothesis, since nature, though she offers us abundance of signs by which we may learn the changes to which she has been subjected, gives us no indication of a period when she began to exist, or of the mode in which the material universe was brought into being.

Now, the first idea which must strike any one who looks, even in the most superficial manner, on the natural objects by which he is surrounded, is, that every portion of the earth has undergone total, and, until they are accounted for, stupendous changes. If he dig a hole in a peat-moss, he finds huge trees rooted in spots where now there is only a shrubless morass; if he cut through the soil of a verdant meadow, he may find a bed of peat enclosing the trunks of trees; if he go still lower, he discovers a bed of clay, including the beds of fresh water fish; still lower, the shells of sea-fish will be intermingled; while below this last layer, or stratum, the shells of salt water shell fish, or, as a naturalist would call them, marine testacea, which have no river or fluviatile species mixed with them. Again, a mountain stream, the sudden melting of ice, or an unusual frost, detaches a fragment from the side of a hill; and behold, similar layers of buried trees, and shells, and bones, are suddenly exposed to view on the elevated mountain precipice! The native of the district collects some of these shells; he has never seen any like them before; no such fish inhabit the neighbouring lakes, or rivers, or ocean, and he pre-erves them in silent and ignorant amazement. At length a traveller arrives; to him the unknown curiosities are shown; and he redoubles the perplexity of the possessor by informing him that he has frequently collected similar shells inhabited by living fish on the shores of the Indian Ocean, or the banks of some distant river. Ten thousand conflicting ideas now crowd upon the collector's mind. Curiosity so startlingly awakened cannot slumber until some satisfaction has been given to its restless spirit. Did these very objects before me once inhabit those distant climes where their brethren now reside? Were they swept from their original seat by the resistless force of some mighty deluge, and left to perish in these ungenial climes? He looks at the hill-side, and the regular order in which he sees layer after layer deposited, checks this conjecture. Surely, had such been the cause of their transportation, masses would have been heaped upon each other in wild confusion. Can they then have once made this their home and dwelling place? Was this once an expanse of waters fitted for the reception and support of creatures which require the heat of a tropical sun? If so, how can the climate have undergone so miraculous a change? Has the sun changed his course? Such are his probable reflections, until he puts an end to his perplexities in one of those ways, according to the character of his mind. If his intellect be restless, impatient, and feeble, after revolving the matter once or twice, and "finding no end in wandering mazes lost," he discards it altogether from his thoughts as impracticable and useless; if he be a pert, conceited, reasoning thing, ever skipping from conclusion to conclusion, with a sneer for all who do not imitate his agility, he straightway forms an hypothesis, quits his single trace of facts, and flits away to some new topic. Should another traveller pay him a visit, and detail new facts inconsistent with his theory, he gives himself no trouble about that. Ignorance and self-conceit have a ready balm for such wounds, and he contents himself with thinking, if he does not absolutely remark, with the Frenchman, that it is "so much the worse for the facts." But if he has a patient, reflecting spirit, a true desire for knowledge, and a proper sense of the united extent of his information—if, in short, he is by nature and by habit a philosopher in the true sense of the word, he treasures up his acquired knowledge, and sets diligently to work to add to his store. He digs new holes, cuts the face of other hills, carefully observes the appearances offered to his view, and procures all the information in his power from those whose observations have been more extensive than his own, or carried on in another direction. Thus he may hope in time to acquire sufficient information to enable him to form some just idea of the causes of the various and apparently inconsistent appearances he has noticed. The first of these classes are evidently incapable of inquiring with effect into any subject. Numbers of the second, and a few of the third and rarest class, have occupied themselves in geology. Among those, incomparably the most distinguished is Professor Lyell, the Newton of the science, whose views I shall now proceed to explain in as simple and as clear a manner as I can. Indeed, it would be difficult to state Professor Lyell's views of the great law which governs the changes to which the structure of the earth is liable, otherwise than simply and clearly; for simplicity is the characteristic of all the great laws of nature; and when once elucidated, they appear to have been, from the first, a most obvious solution of the phenomena or appearances.

Like all other great philosophers, or men who have been remarkably successful in developing the laws of nature, Professor Lyell has constructed his simple hypothesis upon an almost boundless accumulation of facts. In the industry with which he has amassed information respecting the state of the globe, and the cautious use he has made of his materials, he has no superior except the great master of human knowledge, Aristotle, and the reviser of the true Aristotelian mode of philosophising, Lord Bacon.

Before proceeding to explain Lyell's system, it is necessary to point out some of the errors he has to

combat. Hitherto geologists, when at a loss to account for the traces every where left on the face of the earth of gigantic change, have called in to their aid the unbridled violence of the elements. They have supposed the earth at some past eras to have been seized with convulsive paroxysms, which have dislocated all its parts, and shattered its very frame-work. That after these chaotic agitations, it has again settled down into a comparatively quiescent state. In one of these happy intervals we at present exist, warned only of the lurking energies which have wrought these tremendous results, and which may again probably annihilate, in one vast explosion, the present order of things, by the low growl of some insignificant volcano, the slight tremor of a local earthquake, or the ravages of a partial inundation. These philosophers wielded the powers of nature much in the same way as the pre-Newtonian astronomers did the frame-work of the heavens. As the latter lavished upon the celestial architecture, spheres, cycles, and epicycles, without end, "to save the phenomena," so have the former discharged the earthquake, the volcano, and the deluge, with remorseless fury over the fair face of creation. Were they at a loss to account for the elevation of a mountain ridge? Straightway the subterranean mines were charged, and an explosion which would shake creation to the centre shot the Andes up into the regions of air. Were they perplexed by the remains of marine animals on the summits of lofty mountains? Some sudden inversion of the planet hurled an ocean over the heights, and transported thither fragments and relics from the most opposite and distant regions. Such was the recent state of the science of geology. The entire theory of paroxysms and convulsions was as completely a tissue of inventions, supported by no analogy in nature to account for appearances, as the cycles and epicycles of the astronomers. However, Newton arose, and, by the announcement of the simple law of gravity, put an end for ever to the din of conflicting spheres, and the dizzy maze of centric and eccentric orbs. The simple fact announced by Professor Lyell, as the result of extensive observation and calculation, which is to dispense with these periodical returns of agitation, is, that the operations of nature, as seen around us from day to day, are fully adequate to the production of every change which we can ascertain to have taken place in the structure of the globe. He tells us that we may daily see processes going on, which, though insignificant to our limited and brief opportunities of observation, are yet sufficient, by their ceaseless operation, to level the loftiest mountains, fill the profoundest depths, dissipate existing continents, and elevate into their place the "oase and sunken bottom" of the present ocean.

To do justice to his theory, we must consider it under two divisions—the agencies by which these changes are to be effected, and the most probable popular objections to which it may be liable. These agencies are divided into two principal classes—inorganic and organic; that is to say, agents not endowed with life, and those endowed with life, or vegetables and animals. The inorganic causes of change are again subdivided into aqueous and igneous. The aqueous are streams, springs, tides, and currents. The igneous are the earthquake and volcano. These causes, incessant in their operation, are sufficient, according to Lyell, "to produce every change which can be traced in the structure of the earth, and in the distribution of sea and land. To establish this theory, he has collected an astonishing multitude of facts, comprehending almost all the remarkable earthquakes, eruptions, landslips, and floods, recorded in the annals of time. He shows us how the rivers are incessantly wearing down the hills from which they spring, and the soil through which they flow, and conveying the materials to the ocean; how tides are continually filling up arms of the sea, and conflicting currents excavating the floor of the ocean in one place, and heaping up huge accumulations in others. He tells us how earthquakes have occasioned the sudden subsidence or sinking of land in some quarters, and volcanoes have raised new mountains and islands in others. These changes have actually been effected during the very brief period of which we have any records. Now, then, if the same causes continue to operate through an indefinite series of ages, they are obviously sufficient to produce a revolution in the aspect of the globe, and, in the lapse of time, to restore it again to its present condition. Thus we can ascertain, that, within the last two thousand years, the upper part of the Adriatic has received accessions of land of many miles in extent from the deposits left in it by the Po, the Adige, and other rivers descending from the Alps. How can we, therefore, avoid the conclusion, that, in process of time, that gulf must become an alluvial valley, bounded by the Apennines on the west, and its present mountainous shores on the east, and irrigated by the lengthened Po wandering through the centre? Having once pictured such a result in our imagination, as the certain consequence of causes now in operation, we have only to turn our eyes to the great valleys through which many existing rivers flow, to recognise at once the process of their formation.

A recent intelligent traveller in the Highlands and

* Principles of Geology. By Charles Lyell, Esq. F.R.S.
2 Vols. 8vo.

Islands of Scotland describes to us his astonishment and delight in discovering the seas on the west coast filled with living creatures, all of which were engaged in the process of forming land. He perceived that the sea, from Shetland to the Mull of Cantyre, was filled with animals like glittering sand, each of which, on inspection, was found to consist of a minute spiral, resembling the worm of a ramrod, but not the hundredth of an inch in diameter. So numerous were these, that the water seemed muddy with their presence; and he calculates, that if all the hairs on the heads of the men, women, and children, born since the beginning of the world, were enumerated, and all their separate hairs were lives, these would not amount to one generation of this spiral people, born on Monday morning to die on Wednesday night, and so on for ever and ever. Such an infinity of number is absolutely appalling. But even this is nothing, when it is found that the intervals between these are filled by fifty different kinds of creatures, each of them fifty times smaller, and all engaged in the same endless occupation. The invisible, insensible toils of these ephemeral points, conspiring with others in one great design, working unseen, unheard for ever, guided by one volition, by that One Volition which cannot err, converts the liquid water into the solid rock; their bodies die, sink, and concrete; the bottom of the ocean, and the shores of islands, are gradually elevated by the morbid deposit; the deep ocean is at length converted by them into dry land, and extends the dominion of man, who sees it not, and knows it not, over regions which even his ships had scarcely traversed. Thus the Great Pacific, by other means than that of the alluvium of inflowing rivers, is destined, at some future day, to be a new continent.

Facts like these are enough, in my estimation, to indicate the principle of Professor Lyell's theory—a principle which was in fact recognised by some of the ancient philosophers. Indeed it is not to natural objects alone that the great principle of revolution, of decay, and reproduction, is applicable. Every succeeding addition to our knowledge appears to bring us back more and more directly to the views of the leading ancient philosophers, as though science, as well as the material world, had its periods of use, decay, and restoration. Every successive discovery of modern times appears to point more plainly to the principles of the ancients, as though all that we know had been known before, all that we discover discovered before, and the results only to have survived. The process by which the early philosophers arrived at those results has perished; hence doubt and contempt have been thrown upon them by conceited ignorance, until philosophy, after re-exploring the arcana of nature, appears to be finding her way once more to her original resting places. So true is it that there is nothing new under the sun.

In a limited sketch like this it is impossible to do more than indicate the line of argument followed in Professor Lyell's work. For the ample details of facts calculated to establish its truth, I must refer to the work itself.

Let us, however, consider one or two of the objections most likely to occur to plain people when the theory is first explained to them. Many persons are very ready to follow reasoning to a certain extent, who, when a more startling result is presented to them, find it impossible to assent; although it may be quite as fair a deduction as the former. For example, a man may say, "I can easily believe you, when you tell me that a peat-moss was once a forest, and that it was so less than two thousand years ago, when, in addition to the undeniable remains of trees, many of them still rooted in the ground, which I observe, I find beneath it the traces of a Roman road, and hear that the historians of that people mention the spot as a wood; but when I see a bed of coal of prodigious thickness extending quite across the bed of the Forth, at a considerable depth, and you call on me to believe that that too was once vegetable matter, I am staggered, I cannot go along with you." The only way to meet such persons is to show them some equal, or greater, wonder going on before their eyes in a manner which they cannot deny. Detail to him then what is now going on at the mouth of the Mississippi, and his incredulity must give way. In addition to the incalculable quantity of loose drift timber annually carried down and embedded in the Gulf of Mexico by that enormous stream, there is a single raft formed of torn-up trees, ten miles long, two hundred and twenty yards wide, and eight feet deep, the whole of which has been accumulated, in consequence of some accidental obstruction, in thirty-eight years. How insignificant, then, must this mass of timber, enormous as it is, be, when compared to what must have accumulated in the course of centuries at the mouth of the river! When the progress daily making by the river in shallowing the gulf is ascertained, it requires no distant geological view to look forward to a time when that expanse of water will be converted into a vast alluvial plain, through the centre of which the mighty stream will roll its extended course towards "the bated and retiring waters" of the Atlantic. Our objector will now at once perceive, that, whenever such a time shall come, there must be found beneath the bed of the river strata of vegetable origin, more extensive than imagination can conceive.

There may be no analogy between the actual cases, but the one is not more wonderful than the other; and, on the other hand, they might have been similar. A single fact may sometimes occur so intelligible and undeniable, as to have greater weight with many minds than the most ample evidence collected from quarters less accessible and obvious. Thus, the tree lately found in Craigleith quarry, near Edinburgh, was enough to make a Lyellist of the most obstinate of misbelievers. There it was—no child could see it and doubt that it was a tree—the bark, the bend in the trunk, the spots whence branches had been rent, were all too plain to admit of a moment's mistake. Moreover, it lay embedded fifty or sixty feet in solid rock,

"How did it get there?" was the question. Plainly, the rock could not have been rock when the tree got into its bosom. What alterations of flood, earthquake, and volcano might have been brought into play for the purpose of inserting the hapless monarch of the antediluvian forest in the spot where it unquestionably was found, it is impossible to say. Fortunately, Captain Basil Hall had not long before published a volume of travels, in which occurred the following passage:—

"Some years ago," observes the Captain, "when the Mississippi was regularly surveyed, all its islands were numbered, from the confluence of the Missouri to the sea; but every season makes such revolutions, not only in the number but in the magnitude and situation of these islands, that this enumeration is now almost obsolete. Sometimes large islands are entirely melted away—at other places they have attached themselves to the main shore, or, which is the more correct statement, the interval has been filled up by myriads of logs, cemented together by mud and rubbish. When the Mississippi and many of its great tributaries overflow their banks, the waters, being no longer borne down by the main current, and becoming impeded amongst the trees and bushes, deposit the sediment of mud and sand with which they are abundantly charged. Islands arrest the progress of the floating trees, and they become in this manner reunited to the land; the rafts of trees, together with mud, constituting at length a solid mass. The coarser portion subsides first, and the most copious deposition is found near the banks where the soil is most sandy. Finer particles are found at the farthest distances from the river, where an impalpable mixture is deposited, forming a stiff unctuous black soil. Hence the alluvions of these rivers are highest directly on the banks, and slop back like a natural 'glacis' towards the rocky cliffs bounding the great valley. The Mississippi, therefore, by the continual shifting of its course, sweeps away, during a great portion of the year, considerable tracts of alluvium which were gradually accumulated by the overflow of former years, and the matter now left during the spring-floods will be at some future time removed. One of the most interesting features in this basin is 'the raft.' The dimensions of this mass of timber were given by Darby, in 1816, as ten miles in length, about two hundred and twenty yards wide, and eight feet deep, the whole of which had accumulated, in consequence of some obstruction, during about thirty-eight years, in an arm of the Mississippi called the Atchafalaya, which is supposed to have been at some past time a channel of the Red River, before it intermingled its waters with the main stream. This arm is in a direct line with the direction of the Mississippi, and it catches a large portion of the drift wood annually brought down. The mass of timber in the raft is continually increasing, and the whole rises and falls with the water. Although floating, it is covered with green bushes, like a tract of solid land, and its surface is enlivened in the autumn by a variety of beautiful flowers. Notwithstanding the astonishing number of cubic feet of timber collected here in so short a time, greater deposits have been in progress at the extremity of the Delta in the Bay of Mexico."

This settled the matter at once; nothing could be plainer; the rock was sand when the tree was swept down and embedded; its very position is described as exactly as though the Captain had had his eye upon it when writing. This rock, then, was once sand; and a river capable of sweeping down trees of such dimensions as this, held its way over the spot where I am standing. This is certainly evidence of gigantic change, of revolution, which it makes one giddy to contemplate; yet, after all, the very same process is going on at this very moment on the other side of the Atlantic. I may there see actually in progress operations, to the results of which this apparent wonder before me is the fac-simile. With many minds incapable of doing justice to cumulative evidence, one fact so obvious as this would be decisive.

There is another class of objectors, whose doubts I am peculiarly anxious to remove, because, although their hesitation arises purely from ignorance, yet their motives and feelings are entitled to respect. Persons of imperfect education, unaccustomed to the contemplation of philosophical subjects, too often derive their only notion of the formation of our earth from the account given in the first chapter of Genesis. As that account is very brief and general, it is totally impossible that such persons should acquire any but the most confused and imperfect ideas. Studied, indeed, by the light of philosophy, illuminated by knowledge drawn from that ampler revelation of his works, which the Divine Being has vouchsafed to all his creatures in the great volume of nature, its unexplained announcements are felt to be invested with the unalienable sublimity which belongs to the simple enunciation of mighty truths. The revealed Word of God, as contained in the Holy Scriptures, is one only of the manifestations which he has been pleased to make of himself. Its extent has hitherto been limited; its object is clearly defined, to inform man respecting his relation to his Maker, to unfold to him his immortal destiny, and to instruct him how he may become fit for future happiness. It is in no way intended to supply us with information upon natural philosophy. The great volume of nature is spread before us, on which we may see the history of the works of God traced in characters admitting neither of obliteration nor mistake. The incidental notices, therefore, of such topics, occurring in the written Word of God, must be explained and understood by a reference to the more explicit revelation granted for that purpose. The immeasurable spaces of time required by the geologist, especially under the system we are considering, to produce results which can be undeniably shown to have taken place, will appear to any who understand the usual account, in a certain sense inconsistent with its details. Though this error may, in the present day, be confined to very ill educated, or

childish persons, yet there was a time when it was dangerous for a philosopher to give an opinion on any natural phenomena inconsistent with the ordinary expression of sentiment. Galileo was consigned to a dungeon for asserting that the earth revolved round the sun, whereas it was argued that the sun came forth from the east, and ran his course to the west. Buffon was compelled, by the doctors of the Sorbonne, to recant his theory of the formation of the earth, because it was thought contradictory to the narrative of Moses; and in our country many philosophers, little more than a century ago, were exposed to obloquy, if not persecution, from the same propensity to adduce the authority of Scripture on topics foreign to its purposes.

Let none then fear that his religious belief can be endangered by the rational and unfettered study of nature. It is our duty to study God, in his works and in his Word, and to seek in each that peculiar instruction which they are generally intended to afford. Their lessons, if read aright, will infallibly be found to reflect mutual lustre; distinct, but not discordant; differing, indeed, in dignity, but each bearing the visible impress of the same divine origin.

ANNALS OF THE POOR.

No mistake could perhaps be greater than to suppose that we only can take an interest in the sorrows of very lofty and distinguished characters. Yet, upon the strength of this supposition, how exclusively, for many ages, have poets confined their efforts to the tragedies of high historic life! How inseparable is the idea of *dignity* with that of the *Tragic Muse*! No liberal person will deny that the majestic sorrows of even the remotest historical personages have a power over our sympathies; while the very remoteness of their period of existence, and their removal above the general sphere of life, give a scope for romantic sentiment and elevated poetical diction, which would in vain be sought for in the humble tales of the modern domestic world. I would contend, however, that there sometimes occur, in even "the short and simple annals of the poor," situations of more touching distress, more calculated to make the heart gush up to the mouth in a resistless tide of sympathy, than are to be found in almost the whole circle of tragic composition.

Some years ago there appeared in one of the Edinburgh newspapers an unpretending paragraph, respecting the death of a white mouse in the possession of a poor Italian boy. The incident occurred in George Square, in the south side of the town, upon a very cold day, immediately following a deep fall of snow. The boy was described as quite confounded with grief at the decease of the little animal, which had hitherto been the sole means of procuring his subsistence. A white mouse is perhaps but a poor wonder, and, intrinsically or otherwise, of very little value. But, trifling as it was, it was the poor boy's all. He had ventured from his Italian home, thus far into a less clement latitude, upon the strength of this little creature's life; it was his whole stock in trade; and now that he wanted it, he was reduced to utter poverty and desolation, and no hope remained for the future. The boy had sat down upon an outer stair, reckless of the cold, and the still-descending snow. He had taken the expiring creature from its unsheltered cage, and endeavoured to restore its declining strength by fondling it in his bosom. But it died in spite of all his efforts. Still unwilling to believe in the hardness of his fate, he hurried it back again into his bosom. When, at length, he could no longer doubt of the reality of death, he laid the animal upon his knee, and fixed upon it an eye, which, though filled with only one undropping tear, seemed to predicate a whole history of future sorrow. Now, this story, though not here related with the simple force of the original, is in itself superior to one-half of existing tragedies.

An incident somewhat akin took place still more recently. There is a poor old soldier who made a livelihood in Edinburgh by going about with a nondescript machine, which he employed in grinding knives and razors. The cry of this man, though probably intended to be nothing unusual, was given in such a broken-down voice as to be almost unintelligible. His wheel was employed both in moving the machine along, and in turning the stones upon which he professed to sharpen his knives. The whole was a perfect ruin, patched in all places—here with iron clasps, there with ropes, and even in some places with old rags. It would appear that a system of careful repairing will serve in such a case for a certain time; but it will not serve for ever. The machine got at length so clogged with its bandages, that, when attempted to be turned, it sometimes stood still altogether. One day, in George Street, while employed upon a boy's pen-knife, the fatal crisis arrived. The old man desperately plied the thing upon which his foot rested; but it would not do. He tried to put it to rights, when suddenly the whole engine fell to pieces, and presented only the appearance of a heap of old decayed wood, mingled with ropes and rags. Over this heap the veteran stood like a ruler Niobe. He for the first time found himself in perfect despair. His eye did not see alone that wretched pile of rubbish. It penetrated far beyond, and contemplated a home unprovided with the usual humble necessities, a wife in despair, and children who would cry for bread, and he have none to give them. For a moment there was to be seen upon that lordly street as expressive a picture of real woe as poet or painter could have conceived. Fortunately it was but for a moment. Opposite to the scene of distress lived Sir William Maxwell of Monreith, who, happening to be at the window at the time, observed the deplorable accident, and immediately came forth to the street. Sir William had himself been a soldier, and could sympathise with the sorrows of a brother in arms, however far beneath him in rank. He therefore immediately consoled the man by giving an order for a new machine. Thus, for the sum, I believe, of fifteen shil-

lings, did a man of rank purchase one of the most delightful and ennobling sensations which can warm a mortal bosom—the consciousness of having rescued a fellow-creature from undeserved misery. The last pillow of such a man cannot fail to be smooth.

Another tale of simple distress has been thus related by a country correspondent:—Jean Scott, a poor woman about seventy, lives in the neighbourhood of Hawick. She was the daughter of a small farmer, with whom she lived till her fiftieth year, as a servant. Being then left by him without any provision, she sunk into the condition of a field worker, at some such pittance as sixpence or eightpence a-day. At the age of fifty-seven, even this wretched source of subsistence failed her. She was seized with an universal rheumatism, which nearly deprived her of the use of her limbs. She was then compelled, much against her will, to accept of parochial relief, if relief it can be called, which in almost all cases in Scotland is only a weekly alms, a mere mockery of the wants of a human being. Jean lived in a small cottage in a secluded spot, and, though held in universal esteem on account of her humble goodness and piety, and in compassion for her unhappy fate, she was seldom visited. Almost the only company she could be said to enjoy was that of her cat, a large sensible-looking animal, which she had kept since it was a kitten. When the parish officers were first applied to on Jean's account, they represented that it was not proper for a pauper to support such an animal, as either it must take the bite from her own mouth, or from that of some other poor person. Jean was informed of this; but, humbled as she was, she would not hear of parting with her faithful Gibbie. "John Garlies," she said, "had little ado when he took notice she kept a cat. The poor beast had been mainly her only friend for mony a lang day; and if he were to leave her, what other friend or companion would she have? In reality," she added, "Gibbie needs nae 'parish support; he's sic a grand hunter that he can support himself; or, at maist, never expects any thing but his wee drop milk, that's neither here nor there. Part wi' Gibbie! na, ye may tell John Garlies that, rather than do that, I wad want his fourteen-pence a-week a'thegither." Jean carried the day by her energy. The relief was granted without any farther notice of the cat. At length, one severe winter, the friend who was in the habit of bringing her little weekly sum was prevented from doing so by the impossibility of making way through the snow to her secluded and remote abode. All the meal she had in the house was in time exhausted, and, as she had not many peats remaining, she thought it best to take refuge in her bed. There she lay down, with hardly any hope of being rescued from the most painful of all deaths. For a day and a night she lay thus without food. At length, on the second morning, what was her delight on seeing Gibbie come in with a hare in his mouth, which he laid down by her bed-side! It was an animal which some poacher had wounded, and which, in its subsequent distress, had fallen an easy prey to her favourite. Jean, after devoutly blessing her Maker for this supply, rose, and repairing to the burn for water to dress her meal, was now able to prepare a meal even much superior to her usual fare. She remarked to the person who first came to her in her loneliness, that it was evident that He who fed his favourite children with manna and with quails, was still able to provide food in the wilderness for the poorest of his servants. No meal, she said, was ever so delicious in her mouth, not only from the "savour" of the flesh, but from the taste of God's mercy and goodness which she enjoyed along with it.

As a conclusion to these little traits of the poor, I present the following verbatim as I have received it, from the pen of a lady:—

"As I was hurriedly crossing one of the streets of the New Town about a year ago, I was arrested by hearing a sigh, and, looking aside, I perceived an old man, who slightly touched his hat, when I paused a moment to look at him, as I was conscious the sigh had proceeded from him. I asked him if he was in distress. He spoke not, but took his hat from his head, and, with a piteous, heart-rending look, held it out to me. To my great distress, I happened not to have a farthing in my pocket that day, but I assured him that I would be owing him a penny, which I should pay the next time we should meet. I had frequently seen him before, but, from the circumstance of his never having stooped to ask alms, or attracting my attention in any other way, he had passed unheeded. About a week after this time I met him again. My heart smote me—I had no money in my pocket—I paused, and told him so—he burst into tears. I felt touched with pity, and inquired with earnestness into the cause of his distress. He shook his head mournfully, and replied, that his story was long; that I would not stay to hear the sum of his grief; that the rich were callous to the miseries of the poor—he had found it so. I said, he wronged me; that I had really intended to relieve him, but by an unfortunate chance, had no money both times. The old man saw I was serious, and immediately taking off his threadbare ragged hat, which exposed a snow-white head, told me that he was the son of gentleman, whom he had scarcely ever seen since his childhood; that he had never known his mother. He had been sent at the age of seven years to a seminary about twenty miles from Edinburgh, and had there received a liberal education. At the age of sixteen he was taken from school, and sent to the University of St Andrews. Thus, he was a gentleman and a scholar. He had always received remittances through an agent of his father, but now the agent sent for him to his house, and told him that his father had been nearly ten years in India; but as he was in ill-health, it was his wish to return to his native country for three years, and go out again; but previous to setting off, he intended to see his son fairly settled there, and begged that his departure might not be delayed. Every preparation was therefore speedily made, and he set out for India, where he arrived after a

tedious voyage of nine months. His hopes were high, but he met his father with uncertainty; he was yet a stranger to him; there was a mystery about his birth that he was never able exactly to comprehend, and into which he was almost afraid to inquire. His father received him kindly. He had a small property in India, besides a commission under the Company. He meant his son to take the management of his property in his absence, and told him that when he was in England, he would take measures to secure it to him as his successor. He then told him that he was a natural child, and an only one; his mother had died shortly after his birth. More he did not say, and more the son could not ask. It was enough. He felt the sting severely, but it would have been still more severe had he not already more than half feared the reality. After some months spent in daily occupations on the grounds, his father left him for England; but, alas! he was destined never more to see his native land—he died on his passage home. As soon as his death was reported to his friends, a nephew came forward as heir to his monies and estate. He went out to look after it himself. The poor unhappy son was despised and neglected; he had not a place whereon to lay his head. Thus do the errors of the guilty often bring punishment upon the innocent. After spending forty years in India, tossed up and down, enduring many hardships, and perils, and ill-health, he gathered as much together as enabled him to return to Scotland, where he had been wandering up and down without a friend to help him, or a relation that he knew of in the world, seeking what he could find, and occasionally making a little money by writing a few short sketches of his travels, and selling them to a country newspaper or magazine. From one thing to another he at last became a poor unhouseled wretch; and when I saw him, he had almost overcome, from mere want and destitution, all feelings of shame, and was just verging upon the condition of a common beggar. We know not half the hardships the poor go through, nor can we know, unless we make inquiry. I gave the old man my card, and begged him to come to my house, and receive some relief. He came, and regularly returned once a week, according to my desire, for two months. After that I heard nothing more of him for a long time, and I began to fear that he might be among the number of those unfortunate individuals who had lately lost their lives by the pestilence. My curiosity was strongly excited by reading in the newspapers, among other cases reported, that of an old man who died after twelve hours' illness. It was supposed he had caught the infection from going to a house where there had been three deaths the night before. I was strongly tempted to inquire into the case, and accordingly made every inquiry both from the medical man of the district, and others concerned. I was right; it was the same old man with the silver hair and dejected countenance; and I was told that when he was first aware that he was taking cholera, and they were preparing to convey him to an hospital, he made a singular confession. He had heard, he said, that persons who were suspected of having been at the houses of any who had died of cholera, were immediately taken up by the Police, and carried off to a quarantine hospital, where there was every comfort and accommodation; good meat and drink, warm fire and bed—in short, a paradise to what he had been accustomed to. This idea taking possession of his mind, he had at first wilfully visited an infected house, and then gone and surrendered himself to the Police. Alas! in seeking for a temporary haven of rest, he had rushed upon destruction. Ere he had been four-and-twenty hours in the hospital, the symptoms of the disease appeared upon his emaciated frame, and, being immediately removed to the sick hospital, he died after twelve hours of intense suffering."

OUR EAST INDIA POSSESSIONS.

THE colonies immediately dependent on Great Britain, and which are treated as provinces of the empire, however distant they may be, are all inferior in point of value and capabilities to the extensive territory of Hindostan, or the East Indies, as the place has been called. This region, which has fallen under the authority, and almost the proprietary, of a body of English merchants, in a manner immediately to be described, is situated at the southern extremity of Asia, and is principally peninsular in its form. On its northern or inland quarter it is bounded by the Himalaya Mountains, a lofty and extensive range, separating it from the Tartarian deserts. On the south it is everywhere washed by the ocean, and at its outer extremity lies the island of Ceylon. The extreme length of Hindostan has been computed to exceed 1900 miles; its extreme breadth has been taken at 1500; yet such is the irregularity of its form, that the total artificial area cannot be estimated at more than 1,280,000 English square miles. This district is marked out, as it were, by nature, into three grand divisions. The first and greatest of these, called Hindostan Proper, embraces all the provinces north of the Nerbuddah, from the river Indus in the east, to the borders of Chittagong. The second, called the Deccan, includes all within the Nerbuddah and the Kistna. The third, or India south of the Kistna, takes in the remainder of the country. The outermost, or narrowest portion of the peninsula, comprehends the districts called the Mysore and Carnatic.

Every geological feature of India is on a great scale. There are vast sandy deserts, many extensive morasses or jungles, and ranges of Ghauts or mountains of enormous proportions. There are thirteen rivers in the country of the first magnitude; the greatest of these waters being the Ganges. The seasons are periodical in India, and every degree of temperature

is to be found, from burning heat to perpetual frosts; but with the exception of an alpine tract among the northern mountains, the climate is strictly tropical; it promotes the growth of all congenial fruits, plants, and vegetables, in the most luxuriant profusion, but is generally injurious to the health of Europeans. The country is easily affected with pestilences from its hot jungles, and these carry off great numbers of the natives, who, according to one of their own writers, would soon increase to too great a number, but for the occasional destruction of life which thus takes place.

Hindostan has been, from a very remote period of history, in the possession of a race of men as singular in their moral and political habits as they are strongly marked by the peculiarity of their physical formation. Though belonging to a variety of petty principalities, the inhabitants, or Hindoos, bore a resemblance to each other; they were scrupulously divided into sects or castes, were simple but munificent in their mode of living, and were Pagans in their worship. Hindostan was overrun by hordes of Mahomedan invaders in the thirteenth and fourteenth centuries; and these being generally successful in gaining the mastery, quite a new and severe authority was established over India. This interesting country is found to have reached a high degree of refinement, and been engaged in commercial pursuits long before it was visited by Europeans for purposes of civilization. The Greeks and Romans procured from India, ivory, spices, precious stones, silks, and cotton piece goods, in exchange for woollen cloths of a light texture, linen in chequered work, glass, and other articles. It is ascertained that the Hindoos, at an early period, were so far masters of astronomy as to be able to calculate eclipses accurately, and upon sound principles, while numeration by decimals seems to have been indigenous to their country.

While the sovereignty of Hindostan passed from one foreigner to another, or became divided among a multitude of lesser usurpers, the productions of the country, both natural and manufactured, continued to be held in high estimation by nations in the west. The luxuries or manufactured goods of India were nevertheless introduced into Europe by a tedious and expensive route. They were conveyed by land by a march of eighty or a hundred days to the banks of the Oxus, on which they were embarked in vessels which bore them to the Caspian Sea, across which they passed, not without risk, and then ascending the river Cyrus, as far as it was navigable, they were transported over land by a five days' carriage to the Phasis. From the Phasis again they passed to the Black Sea, into which the Phasis falls, while from the Black Sea itself they were conveyed by an easy and well known course to Constantinople. The hazards attending the conveyance of goods were necessarily very great, for in their journey across the vast plain extending from Samarcand to the frontier of China, caravans were exposed to the assaults and depredations of the Tartars, the Huns, the Turks, and other roving tribes which infest the north-east of Asia. Yet the trade with the east was carried on, despite of all these disadvantages, with singular perseverance and ardour. Constantinople became in consequence a great mart of Indian productions.

The Venetians at length interfered in this lucrative traffic, and had the address to secure the most of its advantages. The envy of the other nations of Europe became excited; a thousand schemes were devised with a view of gaining a share in a commerce so profitable, which in the end were successful on the part of the Portuguese. Vasco de Gama, a man of rare talents and courage, succeeded in doubling the Cape of Good Hope on the 20th of November 1497, and pushing boldly across the Indian seas, arrived at Calicut, on the coast of Malabar, on the western side of the peninsula, on the 22d of May 1498.

The discovery of a road by sea to Hindostan produced an extensive traffic with Portugal for the period of a century, but led, as might have been expected, to the ultimate subjugation of the Indian powers by the Europeans. The English having fallen into the opinion that none but the Portuguese had a right to use the route by the Cape of Good Hope, they did not disturb their commerce; the spirit of the nation, however, was not dormant; it was attempted to discover new roads to India, and the adventurous voyages of Drake and Cavendish (1580-6) to Hindostan, by the Straits of Magellan, or the southernmost point of South America, in some measure laid the regions of the East open to British enterprise. In the meanwhile the Portuguese, though they added several valuable stations, particularly Bombay, to their Indian empire, were not left without a rival in the trade to the East, independent of the British. The Dutch penetrated the forbidden channel, and appeared to the dismay of the Portuguese, among the Moluccas. Here the sagacious Hollanders were not slow in supplanting their rivals in the spice trade, whilst they were very little scrupulous in the application of force, as soon as they saw ground to expect that it might be applied advantageously. After a brief but sharp struggle the Portuguese were wholly expelled from the Moluccas; establishments were next formed in Java and Sumatra; and rapid strides were made towards the erection of a new monopoly, which threatened to engross all the most valuable commerce of

these regions. Nor were the Dutch less careful in providing means for the protection of the trade, than industrious in securing the trade itself. They erected forts at convenient stations, which they filled with soldiers, while their armed fleets swept the bays and channels both of the Chinese and Pacific Oceans, with a force which even England would have found it a hard matter, at that time, adequately to oppose. It was no sooner known in London that the Dutch had penetrated beyond the Cape of Good Hope, than the English merchants determined, at all hazards, to keep pace with their rivals.

Now commences the history of the British power in India. In the year 1599, an association of merchants, consisting of a governor and twenty-four directors, was formed, and incorporated by a charter, dated 31st December 1600. The corporation was entitled "The Governor and Company of Merchants of London trading into the East Indies." They were empowered to make bye-laws; to inflict punishments, either corporal or pecuniary, provided such punishments were in accordance with the laws of England; to export all sorts of goods free of duty for four years; and to export foreign coin, or bullion, to the amount of £30,000 a-year, £6000 of the same being previously coined at the Mint; but they were obliged to return, six months after the completion of every voyage, except the first, the same quantity of silver, gold, and foreign coin that they had exported. The duration of the charter was limited to fifteen years, but with and under the condition that, if it were not found for the public advantage, it might be cancelled at any time, upon two years' notice being given. Such was the origin of the East India Company, the most celebrated commercial association either of ancient or modern times, and which has now extended its sway over the whole Mogul empire.

The first adventure of the Company was exceedingly fortunate. On the 13th of February 1601, five ships, loaded with bullion, iron, broadcloths, glass, cutlery, and other goods, set sail from England, and landed at Sumatra, in July 1602. Commercial treaties were entered into with some of the native powers; a valuable cargo of pepper and other produce was taken on board, and the vessels returned home, falling in with and capturing on the way a richly laden Portuguese vessel. The expeditions which immediately followed were not so profitable. But in 1612, Captain Best obtained from the court of Delhi, at that time one of the chief Indian powers, several considerable privileges, and amongst others, that of establishing a factory at Surat, which city was henceforth looked upon as the principal British station in the west of India, till the acquisition of Bombay.

It is curious to trace the steps now pursued to secure the sovereignty of this extensive and fair territory. In establishing factories in India, the English (says McCulloch, whose excellent condensed account of the East India Company I now quote from) only followed the example of the Portuguese and Dutch. It was contended that they were necessary to serve as depots for the goods collected in the country for exportation to Europe, as well as for those imported into India, in the event of their not meeting with a ready market on the arrival of the ships. Whatever weight may be attached to this statement, it is obvious that factories formed for such purposes could hardly fail of speedily degenerating into a species of forts. The security of the valuable property deposited in them furnished a specious pretext for putting them in a condition to withstand an attack, while the agents, clerks, warehousemen, &c. formed a sort of garrison. Possessing such strongholds, the Europeans were early emboldened to act in a manner quite inconsistent with their character as merchants; and but a very short time elapsed before they began to form schemes for monopolising the commerce of particular districts, and acquiring territorial dominion. A detail of the means employed by the East India Company to secure a footing in Hindostan, and its rise to its present enormous power, will form the subject of another paper.

SAILORS AND MARINES.

The words marine and mariner differ by one small letter only: but no two races of men, I had well nigh said no two animals, differ from one another more completely than the "Jollies" and the "Johnnies." The marines, as I have before mentioned, are enlisted for life, or for long periods, as in the regular army, and, when not employed afloat, are kept in the barracks, in such constant training, under the direction of their officers, that they are never released for one moment of their lives from the influence of strict discipline and habitual obedience. The sailors, on the contrary, when their ship is paid off, are turned adrift, and so completely scattered abroad, that they generally lose, in the riotous dissipation of a few weeks, or it may be days, all they have learned of good order during the previous three or four years. Even when both parties are placed on board ship, and the general discipline maintained in its fullest operation, the influence of regular order and exact subordination is at least twice as great over the marines as it ever can be over the sailors. Many, I may say most of their duties, are entirely different. It is true, both the marines and seamen pull and haul at certain ropes leading along the quarter-deck; both assist in scrubbing and washing the deck; both eat salt junk, and drink grog, sleep in hammocks, and keep watch at night; but in almost every other thing they differ. As far as the marines are concerned, the sails would never be let fall, or reefed, or rolled up. There is even a positive Admiralty order against their being made to go aloft.—*Basif Hall.*

Scottish Anecdotes.

DR WEBSTER.

THERE never, perhaps, was a man of higher convivial powers than the late Dr Webster, one of the ministers of Edinburgh. He, in the first place, could enjoy a plentiful and substantial dinner. Then, he could drink three, or even four, bottles of wine at a sitting, without injury to his constitution, or even to his senses, for the time. Lastly, his conversation, on all festive occasions, was a treat of the highest kind. In his time, the magistrates of Edinburgh used to hold frequent festivals in the Star and Garter Tavern, Writers' Court (the celebrated "Clirehugh's") and at all their meetings, they made it their endeavour to have Dr Webster. He was thus led oftener into company than the decency of his cloth could warrant; yet he was, withal, so worthy a man, and so eloquent a preacher, that it would have been a heinous fault indeed which was not forgiven him, both by his flock and by society at large. What rendered this the more remarkable was, that he not only stood high in the ranks of the orthodox, or rigid party, of the Scottish clergy, but was the pastor of a flock which had long been noted for its highflying doctrinal belief, as well as for the strictness of its moral conduct. Reader, he was the minister of that portion of St Giles's called the Tolbooth Kirk; and his congregation was commonly styled the Tolbooth Whigs, on account of their resemblance to the Covenanters of the seventeenth century. Frequent as were his indulgences, and stern as was his flock, Dr Webster lived and died respected, and almost venerated by them. He was a most noted illustration of a great truth—that sins for which ordinary men are condemned and punished with all due severity, are only smiled at, or even perhaps appreciated, in men who have acquired the good graces of the world by genius, or any other agreeable quality. There seemed actually to be a conspiracy among the citizens of Edinburgh to wink at the failings of this popular clergyman. Sometimes, when he was observed walking through the streets of the city, at two or three o'clock in the morning, the people would only observe, "Ah, there's Dr Webster, honest man! He's been ta'en out o' his warm bed, I see warrant, at this untimely hour o' night, to see some puir body. Worthy man!—zealous Christian!—he doesna weary in weel-doing, I trow. It maun be sair on the puir man's health, this night wark; but it will a' tell to his ain guid in the end o' the day."

On one particular occasion, when, rather later and rather more intoxicated than usual, he was stepping softly along the pavement, a friend who met him could not help remarking, "Ah, doctor, doctor, what wad the Tolbooth Whigs say if they saw ye just now?" "Deed," answered the doctor, with his wonted readiness of reply, "they just wadna believe their ain een;" that is to say, they were so prejudiced in his favour, that they would not trust the evidence of their own senses to condemn him.

The history of Dr Webster's marriage is romantic. When a young and unknown man, he was employed by a friend to act as go-between, or, as it is termed in Scotland, black-fit, or black-foot, in a correspondence which he was carrying on with a young lady of great beauty and accomplishment. Webster had not acted long in that character till the young lady, who had never entertained any affection for his constituent, fell deeply in love with himself. Her birth and expectations were better than his; and however much he might have been disposed to address her on his own behalf, he never could have thought of such a thing, so long as there was such a difference between their circumstances. The lady saw his difficulty, and resolved to overcome it, although at the expense of her own delicacy. At one of these interviews, when he was exerting all his eloquence in favour of his friend, she plainly told him that he would probably come far better speed if he were to speak for himself. He took the hint, and, in a word, was soon after married to her. He wrote upon the occasion an amorous lyric, which exhibits in warm colours the gratitude of a humble lover for the favour of a mistress of superior station, and which is perhaps as excellent altogether in its way as the finest compositions of the kind produced in either ancient or modern times. There is one particularly impassioned verse, in which, after describing a process of the imagination, by which, in gazing upon her, he comes to think her a creature of more than mortal nature, he says, that at length, unable to contain, he clasps her to his bosom and—

"Kissing her lips, she turns woman again;"

one of the finest amatory ideas ever committed to song.

As may be easily supposed, Mrs Webster was not by any means disposed, like the rest of the world, to regard her husband's convivial propensities with indulgence. On the contrary, she endeavoured, by all possible means, to prevent him from remaining abroad too late at night; never permitting him to get home on any of these occasions without questioning him very closely as to the where, the wherewithal, and the wherefore, he had been thus besotting himself. It is well known, that if wives will ask impertinent questions of that kind, husbands will tell dreadful lies, to avoid the wrath which they know must fall upon them in case of their divulging the truth. It was a frequent custom of the doctor to answer, that

he had "just been down calling for Dr Erskine [a brother clergyman,] and the doctor had insisted upon him staying to supper." Dr Erskine, who was a clergyman of great worth, but withal not averse to a joke, happened eventually to learn that his friend Webster was in the habit of making him his stalking-horse in this manner; and he resolved to expose the defaulter, in a good-humoured way, to his much-deceived wife. One night, therefore, when Dr Webster was actually in his house, in an accidental way, he made an excuse to retire, and, leaving Webster to sup with Mrs Erskine, went up to the Castle-hill to call for Mrs Webster. Dropping in, as if nothing unusual was in the wind, he consented to remain with Mrs Webster to supper; and thus the two clergymen mutually supped with each other's wife, and in each other's house, neither of the said wives being aware of the fact, and Webster equally ignorant of the plot laid against his character for veracity. Long before Webster's usual hour for retiring, Dr Erskine took leave of Mrs Webster, and returned to his own house, where he found the reverend object of the hoax as yet only as it were pushing off from the shore of sobriety. When his time was come, Webster went home, and being interrogated as usual, "Why," answered he, now at least speaking the truth, "I've just been down at Dr Erskine's." Let the reader conceive the torrent of indignant reproof, which, after having been restrained on a thousand occasions when it was deserved, at length burst forth upon the head of the unfortunate, and for once innocent doctor. The violence and copiousness of the torrent was such, that for some time the intellects of its devoted object were fairly swept away and buried beneath the inundation. When it had at length subsided, and left some points of dry land above the flood, the doctor discovered the hoax which had been played off upon him; and the whole affair was explained satisfactorily to both parties next day by Dr Erskine's confession. But Mrs Webster declared, that, from that time forth, for the security of both parties from such deceptions, she conceived it would be as well, when Dr Webster happened to be supping with Dr Erskine, that he should bring home with him a written affidavit, under the hand of the said Dr Erskine, testifying the fact.

THE LOST WIG.

While Lord Coalstown lived in a house in the Advocates' Close, Edinburgh, a strange accident one morning befell him. It was at that time the custom for advocates and judges to dress themselves in gowns, and wigs, and cravats, at their own houses, and walk to the Parliament House. They usually breakfasted early, and, when dressed, were in the habit of leaning over their parlour windows for a few minutes, before St Giles's bell started the sounding peal of a quarter to nine, enjoying the agreeable morning air, and perhaps discussing the news of the day. It so happened one morning, while Lord Coalstown was preparing to enjoy his matutinal treat, two girls, who lived in the second flat above, were amusing themselves with a kitten, which, in thoughtless sport, they had swung over the window, by a cord tied round its middle, and hoisted for some time up and down, till the creature was getting rather desperate with its exertions. His Lordship had just popped his head out of the window directly below that from which the kitten swung, little suspecting, good easy man, what a danger impended, like the sword of Damocles, over his head; when down came the exasperated animal at full career, directly upon his senatorial wig. No sooner did the girls perceive what sort of landing-place their kitten had found, than in terror or surprise they began to draw it up; but this measure was now too late, for, along with the animal, up also came the judge's wig, fixed full in its determined talons. His Lordship's surprise, on finding his wig lifted off his head, was ten thousand times redoubled, when, on looking up, he perceived it dangling in its way upwards, without any means visible to him by which its motion might be accounted for. The astonishment, the dread, the awe almost of the senator below—the half mirth, half terror, of the girls above—together with the fierce and retentive energy of puss between—altogether formed a scene to which language cannot do justice, but which George Cruikshank might perhaps embody with considerable effect. It was a joke soon explained and pardoned: but assuredly the perpetrators of it did afterwards get many a lengthened injunction from their parents never again to fish over the window with such a bait, for honest men's wigs.

RALPH ERSKINE, THE FATHER OF THE SCOTTISH SECESSION

The only amusement in which this celebrated man indulged was playing on the violin. He was so great a proficient on this instrument, and so often beguiled his leisure hours with it, that the people of Dunfermline believed he composed his sermons to its tones, as a poet writes a song to a particular air. They also told the following traditional anecdote connected with the subject:—A poor man, in one of the neighbouring parishes, having a child to baptize, resolved not to employ his own clergyman, with whom he was at issue on certain points of doctrine, but to have the office performed by some minister of whose tenets fame gave a better report. With the child in his arms, therefore, and attended by the full complement of old and young women who usually minister

on such occasions, he proceeded to the manse of —, some miles off (not that of Mr Erskine), where he inquired if the clergyman was at home. "Na; he's no at hame yeno," answered the servant lass; "he's down the burn fishing; but I can soon cry him in." "Ye needna gie yoursel the trouble," replied the man, quite shocked at this account of the minister's habits; "nane o' your fishin' ministers shall baptizee my bairn." Off he then trudged, followed by his whole train, to the residence of another parochial clergyman, at the distance of some miles. Here, on his inquiring if the minister was at home, the lass answered, "Deed, he's no at hame the day; he's been out since sax i' the morning at the shooting." Ye needna wait, neither; for he'll be sae made out (fatigued) when he comes back, that he'll no be able to say bo to a calf, let-a-be kirsan a wean!" "Wait, lassie!" cried the man, in a tone of indignant scorn; "wad I wait, d'ye think, to haud up my bairn before a minister that gangs out at six i' the morning to shoot God's creatures? I'll awa down to gude Mr Erskine at Dunfermline; and he'll be neither out at the fishing nor shooting, I think." The whole baptismal train then set off for Dunfermline, sure that the father of the secession, although not now a placed minister, would at least be engaged in no unclerical sports, to incapacitate him for performing the sacred ordinance in question. On their arriving, however, at the house of the clergyman, which they did not do till late in the evening, the man, on rapping at the door, anticipated that he would not be at home any more than his brethren, as he heard the strains of a fiddle proceeding from the upper chamber. "The minister will no be at hame," he said, with a sly smile, to the girl who came to the door, "or your lad (sweetheart) wadna be playing that gate t'ye on the fiddle." "The minister is at hame," quoth the girl, "mair by token it's himsell that's playing, honest man; he aye takes a tune at night, before gangin to bed. Faith, there's nae lad o' mine can play that gate: it wad be something to tell if ony o' them could." "That the minister playing!" cried the man, in a degree of astonishment and horror far transcending what he had expressed on either of the former occasions. "If he does this, what may the rest no do! Weel, I fairly gie them up a'thegither. I have travelled this hail day in search o' a godly minister, and never man met wi' mair disappointment in a day's journey. I'll tell ye what, gudewife," he added, turning to the disconsolate party behind, "we'll just awa back to our ain minister after a'! He's no a'thegither sound, it's true; but, let him be what he likes in doctrine, deil hae me if ever I kenned him fish, shoot, or play on the fiddle a' his days!" — From Chambers's Scottish Anecdotes.

PECULIARITIES OF AUTHORS.

The habits and peculiarities of authors in almost every branch of literature have, in many instances, been sufficiently ridiculous. Rousseau, for instance, could write only when dressed in the highest style of refinement, and with crow pens, on tinted or gilt paper. Dr Samuel Johnson was almost the only author of the last century who could write at any time and under any circumstances. In recent times, and in the present day, we find the greater proportion of authors free of the peculiarities which were fashionable among their predecessors; occupying half their time with some ordinary pursuit, and taking up the pen in most cases in the intervals of business. The chief composers of music were in general still more affected and impassioned in their feelings than the authors of last century, and were apparently unable to compose, unless under great excitement. It is seen from a recent article in the *Harmonicon*, a respectable musical periodical, that Gluck, in order to warm his imagination, and transport himself in idea to Aulis, or Sparta, was accustomed to place himself in the middle of a beautiful meadow. In this situation, with a piano before him, and a bottle of Champagne by his side, he wrote his two *Iphigenias*, his *Orpheus*, and other works. Sarti, on the contrary, required a spacious, dark room, dimly illuminated by a lamp suspended from the ceiling; and it was only in the most silent hours of night that he could summon musical ideas. Cimarosa, it seems, was fond of noise; he liked to have his friends about him when he composed. Frequently, in the course of a single night, he wrote the subjects of eight or ten charming airs, which he afterwards finished in the midst of his friends. Cherubini was also in the habit of composing when surrounded with company. If his ideas did not flow very freely, he would borrow a pack of playing cards from any party engaged with them, and fill up the *pips* with faces caricatured, and all kinds of humorous devices, for he was as ready with his pencil as his pen, though certainly not equally great with both. Sacchini could not write a passage except when his wife was at his side, and unless his cats, whose playfulness he admired, were gambolling about him. Paisiello composed in bed; and it was there that he planned *Il Barbiere di Siviglia*, *La Mohnara*, and other chefs-d'œuvre of ease and gracefulness. Zingarelli would dictate his music after reading a passage in one of the Fathers of the Church, or in some Latin classic. Haydn, who was lofty in his conceptions, required a peculiar, but a harmless species of excitement. Solitary and sober as Newton, putting on his finger the ring sent him by Frederick II., and which, he said, was necessary to inspire his imagination, he sat down to his piano, and in a few moments soared among the choirs. Nothing disturbed him at Eisenstadt, the seat of Prince Esterhazy; he lived wholly for his art, exempt from worldly cares, and often said that he always enjoyed himself most when he was at work.

BIOGRAPHIC SKETCHES.

THOMAS BLACKLOCK.

AMONG men who have distinguished themselves in literary pursuits, and been remarkable for the difficulties which they overcame in attaining a deserved eminence in society, none can be more worthy of being made known to my juvenile readers than the late amiable Dr Blacklock, a Scottish poet of the last century, and a person who, from his earliest youth, laboured under the irremediable calamity of total blindness.

Thomas Blacklock was born on the 10th of November 1721, at Annan, a town in Dumfries-shire; his parents were natives of Cumberland, his father a bricklayer, and his mother the daughter of Mr Richard Rae, an extensive cattle-dealer. Before he was six months old, he lost his sight in the small-pox, and was thus rendered incapable of learning a mechanical trade, while the poor circumstances to which a series of misfortunes had reduced his father, placed equally beyond his reach an education for any of those professions where the exercise of the mental faculties is principally required. His affectionate parent seems to have been aware, however, that the happiness of his son, shut out from so many of the enjoyments afforded by the external world, must mainly depend upon his intellectual resources; and, in order to form these, he devoted part of his leisure hours to such instruction as his poor blind boy was susceptible of;—he read to him at first the books adapted to the understanding of a child, and afterwards those fitted for a maturer capacity, such as Milton, Spenser, Prior, Pope, and Addison. His companions also, who pitied his want of sight, and loved him for his gentle disposition, lent their assistance in this task of kindness; and by their help he acquired some little knowledge of Latin. Thomson and Allan Ramsay were his favourite authors; and it was as early as his twelfth year that he evinced still more decidedly his love of the poetical art by the composition of an ode, addressed "To a little Girl whom I had offended"—a production not remarkable solely on account of the future celebrity of its author, but because it displays at once his mildness of temper and lively fancy.

Thus early did Blacklock show, that in the course of reading chosen for him, his father had not mistaken the bent of his inclination. But though, as I have mentioned, some of his comrades delighted to forward his favourite studies, and, by their assiduous attentions, to make him forget the deprivation under which he laboured, there were others who took pleasure in rendering him bitterly conscious of his misfortune, and exulted in the success of such practical jokes as it was easy to make him the subject of. It is but too obvious that his own experience at this period, when exposed to the insults of unfeeling boys, suggested the reflection introduced in the article "Blind," afterwards written by him for the *Encyclopædia Britannica*:—"Parents of middle or of higher ranks," he there remarks, "who are so unfortunate as to have blind children, ought by all possible means to keep them out of vulgar company. The herd of mankind have a wanton malignity which constantly impels them to impose upon the blind, and to enjoy the painful situation in which these impositions place them. This is a stricture upon the humanity of our species, which nothing but the love of truth and the dictates of benevolence could have extorted from us. But we have known some," he adds, evidently referring to himself, "who have suffered so much from this diabolical mirth in their own persons, that it is natural for us, by all the means in our power, to prevent others from becoming its victims." The very means taken to alleviate Blacklock's misfortune in some sort increased its force; for as his mind expanded, it taught him to feel with greater keenness his own dependent condition: familiar with some of the noblest flights of genius, and himself become a poet, he would probably have exchanged all his intellectual stores for the ability of earning his bread by handicraft labour. Lamenting his blindness, he thus closes an enumeration of the miseries it entailed upon him—

"Nor end my sorrows here: The sacred fane
Of knowledge, scarce accessible to me,
With heart-consuming anguish I behold;
Knowledge for which my soul insatiate burns
With ardent thirst. Nor can these useless hands,
Untutor'd in each life-sustaining art,
Nature this wretched being, and supply
Frail nature's wants, that short cessation know."

Alternately depressed by a sense of his own helplessness, and comforted by that piety with which he seems to have been from first to last most deeply imbued, Blacklock lived at home till his nineteenth year. A fresh misfortune then overtook him in the loss of his father, who was crushed to death by the fall of a malt-kiln, with eighty bushels of grain upon it, belonging to his son-in-law. Blacklock's affection for his parents must have exceeded that of other children; for that anxious solicitude about his safety and comfort, which other boys begin to forget when the business of the world removes them from its immediate influence, had been to him extended over those years when to the helplessness of a child he added the sense and feelings of a man. To his keenly susceptible mind this stroke must therefore have been peculiarly afflicting. And it was attended not only with regret on account of remembered benefits, but

also by the anticipation of future evils. A means of livelihood was indeed suggested by Blacklock's love of music. As he played well on the violin and flute, and even composed pieces with taste, it was proposed that he should follow this art as a profession. "But the unhappy situation in which he was then placed," says the authority upon which this statement is given, "made him dread consequences to which he could never reconcile his mind. The very thought that his time and talents should be prostrated to the forwarding of loose mirth and riot inspired him with an honest indignation." Unable to bring down his mind to this occupation—the only one which seemed within his reach—deprived of the stay on which he had hitherto leaned, blind and feeble, no wonder that the fate of a houseless beggar sometimes presented itself as what might possibly happen to himself. Burns occasionally indulged in similar forebodings; but when he depicts his unhappy fortune, and doggedly exclaims

"The last o't, the worst o't,
Is only but to beg!"

we must be excused for iron-heartedly recollecting that he was an able-bodied man, who, as his brother Gilbert records, never met with his match in mowing—the hardest of all rustic labour. A man so gifted, yet so complaining, meets with little sympathy, as he is entitled to none; but with poor Blacklock the dread of dying a houseless wanderer was more than a mere rhetorical flourish, or the indulgence of a groundless querulousness. While we read the lines in which he unfolds his fears, we perceive that anguish wrung his heart in writing them, and we know that his situation justified his apprehensions.

"Dejecting prospect! soon the hapless hour
May come—perhaps this moment it impends—
Which drives me forth to penury and cold,
Naked, and beat by all the storms of heaven,
Friendless and guideless, to explore my way;
Till on cold earth this poor unsheltered head
Reclining, vainly from the ruthless blast
Respite I beg, and in the shock expire."

Although gloomy anticipations like these sometimes intruded, Blacklock did not permit them to overwhelm him, but calming his fears, and resting with a pious confidence in the awards of a protecting Providence, he continued to live with his mother for a year after his father's death.

Some of his poems had by this time got abroad, and made him known beyond his own immediate circle of friends. I shall not pretend to deny that the circumstance of his blindness had some effect, in addition to the intrinsic merits of these productions, in making them be sought after and dispersed among literary persons. On account of their being the verses of a blind poet, they were no doubt read by many who were little able to appreciate their real excellences, and who, having gratified their curiosity, did not concern themselves about the condition of the author; but still by this means the fame of Blacklock's genius was extended; and at last it reached a gentleman, who to curiosity added benevolence of heart. This was Dr John Stevenson, a physician in Edinburgh, who, while on a professional visit in Dumfries, saw some of our author's pieces, and resolved to afford the young man's talents the opportunity of expanding in avocations and amid society more congenial to one so much restricted to pleasures of an intellectual kind. Accordingly, Blacklock was, in 1741, induced to remove to the metropolis, where he attended a grammar-school for some time, and afterwards entered as a student in the college, Dr Stevenson supplying him with the means necessary for the prosecution of his studies. To the friend who thus so efficaciously patronized him, he afterwards inscribed an imitation of the ode to Mæcenas, which occupies the first place in his poems as it does in those of Horace; and that he never forgot the benefits bestowed upon himself is manifested by the ready zeal which his future life at all times displayed for the encouragement of unnoticed genius.

Blacklock's studies were interrupted by the expedition of the Highlanders, in 1745; and during the distractions consequent upon that memorable campaign he resided in Dumfries with Mr M'Murdo, his brother-in-law. On the re-establishment of peace, he returned to college, and studied six years more. In this period he acquired a good knowledge of all those branches of education where he was not hindered by the want of sight, and became better skilled than was common in the French language, from being on habits of intimacy with the family of Provost Alexander, whose wife was a Parisian. It may well inspire wonder that latterly there was no science with which Blacklock had not made himself acquainted—no learned language which he did not master—and no modern tongue, of any acknowledged use to a man of general literature, with which he was not more or less familiar.

Amid the severer studies of classical learning, philosophy, and theology, his attachment to poetry was not forgotten. In 1746, a volume of his verses in 8vo. was published at Glasgow. A second edition followed at Edinburgh, in 1754; and two years afterwards, a quarto edition, with an account of his life by Mr Spence, Professor of Poetry at Oxford, came out by subscription in London.

Hume the historian was among the friends who early interested themselves in the fortunes of Blacklock, and was of considerable service in promoting the subscription to the London edition of his poems; but all intercourse between them was subsequently broken off.

The course of study followed by Blacklock at college was that usually gone through for the purpose of entering upon the ministry; but it was not till after the abandonment of a project (which he began to entertain in 1757, and from which he was dissuaded by Mr Hume, after making considerable preparations towards it) for delivering lectures on oratory, that he finally adopted the resolution of becoming a clergyman. Having applied himself for some time exclusively to the necessary studies, he was licensed as a preacher by the presbytery of Dumfries, in 1759. He soon acquired considerable reputation as a pulpit orator, and took great delight in composing sermons, a considerable number of which he left behind him; these it was at one time the intention of his friends to publish, but for some reason or other this has never been done.

I have already adverted to the unthinking insults to which his blindness exposed him while a boy, and it appears but too certain that many who had arrived at manhood in respect of their outward frame, did not treat him with greater tenderness in his maturer years. They did not, perhaps, decoy him to the edge of a ditch that they might have the satisfaction of seeing him flounder into it, or offer prickles to his grasp that they might be diverted by the contortions of countenance which the unexpected wounds occasioned; but they went to see the blind poet, and induced him to recite his verses, from the same kind of motive that takes people to witness the exhibition of a learned pig. Blacklock's position in regard to such visitors was peculiarly painful: he was in a great measure dependent upon his talents for support; and to have indignantly refused to display them, would have been to raise up obstacles to his own success. His feelings were at the same time the most nicely wrought, and even the triumphs of genius did not afford him perfect gratification; for he knew that his hearers were not carried away by his enthusiasm, but listened with a cold and critical attention, noting every peculiarity of tone, look, and gesture. He has himself told us how exquisitely painful was the consciousness of being the object of such unfeeling curiosity.

In 1762, the Earl of Selkirk procured from the Crown a presentation to the parish of Kirkcubright in favour of Mr Blacklock, who, having thus the prospect of a competent income, married Mrs Sarah Johnston, daughter of Mr Joseph Johnston, surgeon in Dumfries. But, though not disappointed in the happiness he expected to derive from this union, the gleam of fortune which seems to have induced him to form it, forsook him immediately after the step was taken. He was ordained a few days after his marriage; but the people of the parish refused, on account of his blindness, to acknowledge him as their pastor; and a lawsuit was commenced, which, after two years, was compromised by Blacklock retiring upon a moderate annuity. From the first moment of opposition, it had been his wish to make this arrangement, not from any conviction of incompetency to the duties of a parish minister, but because he saw it was needless to contend against a prejudice so strongly maintained.

In 1764, after the connection between him and the parish of Kirkcubright was dissolved in the manner just mentioned, Blacklock removed to Edinburgh, where he received boarders into his house, superintending the studies of those who chose to have such assistance. "In this occupation," says Mackenzie, "no teacher was perhaps ever more agreeable to his pupils, nor master of a family to its inmates, than Dr Blacklock. The gentleness of his manners, the benignity of his disposition, and that warm interest in the happiness of others which led him so constantly to promote it, were qualities that could not fail to procure him the love and regard of the young people committed to his charge; while the society which esteem and respect for his character and his genius often assembled at his house, afforded them an advantage rarely to be found in establishments of a similar kind. The writer of this account has frequently been a witness of the family scene at Dr Blacklock's; has seen the good man amidst the circle of his young friends, eager to do him all the little offices of kindness which he seemed so much to merit and to feel. In this society he appeared entirely to forget the privation of sight, and the melancholy, which, at other times, it might produce. He entered with the cheerful playfulness of a young man into all the sprightly narrative, the sportful fancy, the humorous jest, that rose around him. It was a sight highly gratifying to philanthropy to see how much a mind endowed with knowledge, kindled by genius, and, above all, lighted up with innocence and piety, like Blacklock's, could overcome the weight of its own calamity, and enjoy the content, the happiness, the gaiety of others. Several of those inmates of Dr Blacklock's house retained, in future life, all the warmth of that impression which his friendship at this early period had made upon them; and in various quarters of the world he had friends and correspondents, from whom no length of time, or distance of place, had ever estranged him."

In these hours of social relaxation, Blacklock found one of the greatest pleasures of his existence. Music also afforded him a lively gratification; for he sang with taste, and performed tolerably well on several instruments, particularly on the flute. He had learned to play on the flageolet in consequence of a dream in which he supposed himself to listen to the most enchanting melody, produced by a shepherd on a hill-side from that instrument; and he always carried one in his pocket, on which he was by no means averse from being asked to perform—"a natural feeling," says Mackenzie, "for a blind man, who thus adds a scene to the drama of his society."

Finding that his increasing years and infirmities required repose, Dr Blacklock discontinued the keeping of boarders in 1787. But though his bodily vigour began to fail, he experienced no diminution of that benevolence which had ever characterised him. His own genius having been greatly indebted to patronage, he was ready to acknowledge it in others, and especially to

cultivate and bring it into reputation where he found it struggling with obscurity. Nor were his efforts for this purpose confined to occasional acts of liberality—they were laborious and long-continued. He had taken a boy from a village near Carlisle to lead him, and perceiving in the youth a willingness to learn, taught him Latin, Greek, and French, and having thus fitted him for a situation superior to that in which he was born, procured for him the situation of secretary to Lord Milton, who was chief active manager of state affairs in Scotland for many years. This young man was Richard Hewitt, known to the admirers of Scottish song as the author of "Roslin Castle." Hewitt testified his gratitude to his instructor by a copy of complimentary verses, in every line of which may be traced the chief excellence of compositions of that description—sincerity; but he did not long enjoy his change of fortune, having died in 1764 from the fatigue of the office to which he had been elevated.

But we find a still more eminent example of Blacklock's solicitude to promote the interests of the sons of genius, in his being the first man among the literary circles of Edinburgh who appreciated the poetry of Burns (perhaps, indeed, because he had the earliest opportunity of becoming acquainted with it), and kindled in the author the ambition of a prize beyond that of provincial fame. The Rev. Mr Lawrie of Newmills had transmitted to Blacklock a copy of the Kilmarnock edition of Burns's Poems. It is not easy for a modern reader to understand with what wonder and delight Blacklock must have perused them. In our time, the pleasure felt from his most perfect pieces is damped by the recollection of their author's melancholy fate. What reflecting mind can turn from the perusal of the "Mountain Daisy," with any other feeling than that of sorrow that Burns was not a better and a happier man? But while his career was yet to run, with what enviable anticipations must such a perusal have inspired a generous heart! Here was poetry the purest and most genuine: he who produced it was of no note; but to what a high place in his country's esteem might he not rise! The world was then all before him; and he capable of attaining whatever fame the most ardent imagination could desire. With calmness, yet with energy, the enthusiastic Blacklock indicated his own admiration and the certainty of the poet's future fame:—"I had taken the last farewell of my few friends," says Burns; "my chest was on the road to Greenock; I had composed the last song I should ever measure in Scotland—"The gloomy night is gathering fast"—when a letter from Dr Blacklock to a friend of mine overthrew all my schemes, by opening new prospects to my poetic ambition. The Doctor belonged to a set of critics for whose applause I had not dared to hope. His opinion that I would meet with encouragement in Edinburgh for a second edition, fired me so much, that away I posted for that city, without a single acquaintance, or a single letter of introduction."—"Blacklock received him," says Dr Currie, "with all the ardour of affectionate admiration; he eagerly introduced him to the respectable circle of his friends; he consulted his interest; he emblazoned his fame; he lavished upon him all the kindness of a generous and feeling heart, into which nothing selfish or envious ever found admittance."

Besides the miscellaneous poems by which Dr Blacklock is best known as an author, he published several other works. In his latter years he was occasionally afflicted with deafness—in his case a double calamity, as at the period when it visited him, he was in a manner shut out from all communication with the external world. In this forlorn condition—old, blind, and sometimes deaf—it was more difficult for him than formerly to bear up against the depression of spirits to which he had always been more or less subject; but his gentleness of temper never forsook him, and though he could not altogether avoid complaint, he was not loath to discover and state some alleviating circumstance along with it. He died from fever, after a week's illness, on the 7th July 1791, and was buried in the ground of St Cuthbert's Chapel of Ease, where there is a tombstone erected to his memory, with an inscription by Dr Beattie.

It has been said of Dr Blacklock that "he never lost a friend nor made a foe;" and perhaps no literary man ever passed through life so perfectly free from envious feeling, and so entirely respected and beloved. His conversation was lively and entertaining; his wit was acknowledged, but it had no tinge of malice; his temper was gentle, his feelings warm—intense; his whole character was one to which may be applied the epithet of amiable, without any qualification.

To Dr Blacklock as a poet, the rank of first-rate excellence has not been assigned, and is not claimed; but his works possess solid merits, which will always repay a perusal. The thoughts are for the most part vigorous, seldom less than just; and they are conveyed with a certain intensity of expression, which shows them, even when not uncommon in themselves, to be the offspring of a superior genius. As the production of a blind man, they present a study of the very highest interest, and have frequently been viewed as a problem in the science of mind.—*Abridged from Chambers's Scottish Biographical Dictionary.*

SUNDAY SCHOOLS IN GREAT BRITAIN.

There are at least one million and a quarter of scholars belonging to Sunday schools in the united kingdom; and, taking the population at twenty-one millions, that will give one child to Sunday schools out of every seventeen persons of the population. The average expense of conducting a Sunday school, of two hundred children, is about L.5 per annum for lessons and books, if purchased at the Sunday School Union Depository, and about L.15 per annum for rent: the chief part of which sums are, in most cases, contributed by the teachers themselves, in addition to their gratuitous labour. So that the children can be instructed in the Sunday school for two shillings per annum.—*Imperial Magazine.*

Column for Little Boys and Girls.

MY DEAR LITTLE BOYS,

AGAIN I return with pleasure to the agreeable duty of furnishing for your instructive entertainment a relation of certain remarkable things well worthy of your attention, and which, I have no doubt, your little sisters will be quite as glad to hear something of as yourselves. Run, therefore, to the door, and call Elizabeth, and Mary, and Emma, and all the rest of them, and tell them that the gentleman who puts the nice trustustories into the Journal for boys has just called, and brought a pretty little book in his pocket, containing a variety of delightful pieces, which it will be quite charming to read by the fire-side. Ay, now that is right—there you are all gathered; so sit down in quietness; and see you, Tom, you who are a clever little chap, and are said to be the best reader, take this handsome volume, which you perceive is entitled "ART IN NATURE,"—an ingenious and pleasing production, just published, for the special use of all good boys and girls; and commence reading, in a clear soft voice, the account given by the author of the character and habits of Bees. The chapter, I think, is that called "The Confectioners"—a subject which is prettily introduced.

"Spring walks over the earth clothed in beauty as with a garment, and thousands of lovely flowers arise in her footprints."

There the rose unveils

Her breast of beauty, and each delicate bud
O' the season comes in turn to bloom and perish.
But first of all the violet, with an eye
Blue as the midnight heavens; the frail snow-drop,
Born of the breath of winter, and his own brow
Fixed like a pale and solitary star:
The languid hyacinth, and wild primrose,
And daisy trodden down like modesty;
The fox-glove, in whose drooping bells the bee
Makes her sweet music; the tangled woodbine,
Lilacs, and flowering limes, and scented thorns,
And some from whom the voluptuous winds of June
Catch their perfumings.

How delighted are children with them! See, they come joyously with what they have gathered! but they have loaded themselves too much;—one blue flower, and then a yellow one, and now one of crimson, falls from the pinafore to the ground; and in the meadows, some are bounding about "to gather king-cups," or make of them a little heap, and then sort or bind them together, with many a sly antic and merry gambol.

And this feeling seems sometimes "to grow with the growth, and strengthen with the strength." People of early times and distant spots showed its powers. Flowers were used at banquets, scattered in the temples, presented on the altars, strewed in the path of conquerors, and offered by the young and the aged as the expression of friendship and of love.

With such thoughts as these, Mr and Mrs Elwood were walking, preceded by their two children, one fine morning towards the end of May, when, as they were about to pass a garden in which there was a snug and rose-covered cottage, Mr Elwood desired his children to stop and observe what was going on. A boy, who had been set to watch the hive, had just given notice of the flight of its inmates, and forthwith a ringing commenced with pans and fire-shovels, to "charm them down," as the country people say. Happily, the queen-bee quickly alighted on the end of a bough, and the rest of the bees clustered about her, when the neatly-dressed and healthy-looking cottagers spread a cloth on the table, and holding an empty hive under the swarm, suddenly shook them into it, and placed it, with its captives, on the cloth. Then they were carried to the spot they were to occupy, on the edge of a flower-bed; and in a few hours, Mr E. remarked, they would be perfectly contented with their new home.

Frederick and Emma wished to know all about these wonderful little creatures at once; but their father said he could give the best account of the hive bee when he was at home, because he had some books there from which he should like to read the remarks of those who had attentively studied the subject; and, as they were about to return, their patience would not long be exercised.

Accordingly, Mrs E. had no sooner taken off her bonnet and shawl, and entered the parlour where Mr E. and his son were seated, than Emma came bounding in, saying, "Now, dear papa, for the bees!"

"Or suppose we call them the confectioners," said her father. "We passed Mr Duncombe's shop just now, so full of candles, jellies, and preserves; but these little creatures were wholesale manufacturers of sweets even before the flood. In many parts of the east, honey may still be drank from the rock, in cavities of which it is frequently deposited; and doubtless it was often received from thence by the patriarchs themselves. But shall I tell you, my dears, about their making honey only, or shall I connect with this some other curious things?"

E. Perhaps, papa, making honey would be a very short story; and the longer one of yours is, the better we like it.

Mr E. Then I will begin with reading what Reaumur says about dividing a swarm—a process like that which you have just seen!—After the tumult excited by their removal into a little glass hive was calmed, and I had looked at it for ten minutes, for the first time in my life I succeeded in seeing a queen bee, which was walking at the bottom of the case. For the first few minutes in which I followed her with my eyes, I was tempted to believe that the stories of the respect paid her by the other bees, the train by which she was attended, were fables rather than facts. She was alone, and walking, perhaps, at a slower pace than the rest. The friends who were with me were pleased to discover in her gait something of gravity and majesty. She advanced unattended to one of the squares of the hive, up which she mounted to join a group of her subjects perched at the top. In a little time she appeared at the bottom, but still sadly neglected. She ascended a second time, and I lost sight of her for a few instants; she then appeared for the third time at the bottom of the hive. Now, however, twelve or fifteen bees were ranged around her, and seemed to form her train. In the first moments of trouble and confusion we think only of ourselves. If we were in a large saloon, and it had suddenly broken down, in the confusion we should forget that others dearer than ourselves were in the room. Thus it was with these bees; for, being huddled into the little glass hive, turned topsy-turvy, the first impulse of each seemed self-preservation; and it was only when they had recovered their composure that they began to recollect the mother, which, in their fright, they had forgotten and neglected.

In spite of my inclination to believe that the first train

which I had perceived was the effect of chance—in spite of my disposition to think that a big bee would be followed precisely because it was big—I was forced to acknowledge that there was some other foundation for the homage, the cares, and attentions, which the rest paid to her who was destined to be the mother of a numerous progeny. The queen, with her little suite, disappeared for a moment among a cluster of bees. In a short time she re-appeared at the bottom of the hive, when a dozen others hastened to join the train. A row flanked her on each side as she walked; others met her before, and made way as she advanced; and in a very short time she was surrounded by a circle of upwards of thirty bees. Some of these, approaching nearer than others, licked her with their trunks; others extended their organ, filled with honey, for her to sip sometimes I saw her stop to partake of the food; at other times she sucked when in motion.

E. But what are the other bees in a swarm?

Mr E. It consists, first, of *workers*, amounting generally to many thousands in number, and easily recognised by their smallness and their industry; and, secondly, of *males*, of which several hundreds belong to each community; these are larger than the working bee, and live idly.

F. How do they begin to work, papa?

Mr E. By searching for pollen, or yellow dust, which lies loosely in the middle of flowers. As the breast, legs, and many other parts of the bee's body are covered with a fine down or hair, it enters the cup of a flower, rolls itself round, and is soon quite covered with the yellow dust. The last joint but one of each leg is formed exactly like a brush, and these natural brushes are passed one after another over the various parts of its body to secure the treasure, and to collect it into two little heaps. The thighs of the last pair of its legs are furnished with two cavities fringed with hair; and these form a convenient little basket for its use. The dust collected from a thousand flowers is kneaded into small pellets, or balls, and stuck into these hollows, and as soon as the balls are as large as a grain of pepper, away flies the insect to place its store in the hive. On reaching it, it enters one of the cells held foremost, takes out the pellets from the cavities, and these, being moistened and mixed with a small portion of honey, are kneaded into a substance called in the country 'bee-bread,' a proper supply of which is necessary to the health and strength of the bees during the winter season. Without this, they become consumptive and die. Besides this, however, they want propolis,

F. What is that, papa?

Mr E. A resinous gum found in certain trees, such as the birch, the willow, and the poplar. Near the outlet of one of his hives, Huber placed some branches of the latter, out of which comes a transparent juice of the colour of garnet. On these some weaker bees soon perched. Having taken some of the gum, they formed it into pellets, put them into the baskets of their thighs, and, thus loaded, flew to the hive, where some of their fellow-labourers instantly came to help them in laying it down: after which the pellets were laid in a little heap as near as possible to the place where they were to be used. A bee then drew out a thread from the mass, which it cut off with its teeth, and held with the claw of one of its feet; and when he came out, one part of the cell was found by this means to be lined and soldered. Others gave him their aid, proceeding from one cell to another, until all the cells destined for the young had been soldered and strengthened by this substance, which is soft at first, and at length becomes much harder than wax.

E. Wax, papa! what is wax?

Mr E. It is a secretion found in the form of scales under the belly of the bee. Among the workers in a hive, some are architects, who plan and build, and, at the same time, nurse the young; and others only bring the materials, but do not give them shape; the former Huber calls the nurse bees; the latter, wax-workers. The wax-workers, then, having filled themselves at the flowers, hang motionless in festoons—that is, like rows of curtains one above another—and, in four-and-twenty hours, thin white scales appear under the rings of the abdomen. Huber watched some doing this, and, at length, saw a bee come out from the middle of the group, and, clearing a space about an inch round at the top of the hive, applied the pincers of one of its legs to its side, took off a scale of wax, and began to mince it with its tongue, which sometimes appeared like a bricklayer's trowel, then flattened like a spatula, or broad-bladed knife; and at other times, ending in a point like a pencil. The scale, moistened with a frothy fluid, became glutinous, and was drawn out like a ribbon. This bee, which Huber calls 'the founder,' then put all the wax it could make to the vault of the hive, and went its way; a second did the like; a third followed, but, owing to some blunder, did not put the wax in the right line, upon which another bee, as if sensible of the defect, removed the misplaced wax, and, carrying it to the former heap, placed it there exactly in the order and direction pointed out.

F. What was done then, papa?

Mr E. The result of these labours was a little block of wax, fixed to the vault of the hive, running in a straight line, with a rough surface, but round in its edges, half an inch long, a sixth of an inch high, and about the twenty-fourth part of an inch thick. The wax-workers, having got the stock of materials ready, an architect, or nurse-bee, quitted the cluster, examined both sides of the block, felt about with its antennae, or horns, and then, like a skilful mason, began to scoop out, exactly in the centre, as much of the block as equalled the size of a common cell; and, after kneading what it had removed, placed it carefully at the sides of the opening. Having done this it was succeeded by a second bee; and, in this manner, upwards of twenty workers followed each other, each one taking care to push forward the material so as to extend the walls of the cell.

F. But, papa, is not the stock of wax they make soon out?

Mr E. It would be, were not the wax-workers constantly making a fresh supply. Their dispatch is very great. When first settled in a new hive, they will sometimes form a comb twenty-seven inches long, by seven or eight inches wide, in twenty-four hours; and they will half fill the hive in five or six days; thus in the first fifteen days of their possession of a new abode, as much wax is made as they use during the remainder of the year.

E. Of what use are the cells?

Mr E. The first sort are for the larvae, or grubs of workers; the second for those of the males, or drones, which are larger, and usually placed in the middle of the comb; the third are the royal cells. Some might suppose that the various cells composing a cake are little habitations for the workers to rest in, each in his own house after the labours of the day, but it is not so;

some are filled with honey, and others are closed up. Most of the cells, indeed, contain a little worm—the young of the bee, which is an object of the greatest anxiety and care. The mode of rest is singular; four or five cling to a part of the hive, and stretch out their hind legs, to which others cling by their forefeet; these do the same for another line; and thus at all times bunches, or festoons, of bees, may be seen reposing. Huber, however, has seen the workers retire to a cell, and remain motionless for twenty minutes.

F. How long are the bees in growing, papa?

Mr E. I will read what Huber says:—“The worm of the worker takes twenty days, the male twenty-four, the queen sixteen days, in reaching maturity. The worker remains three days in the egg, and five in the grub state, when the bees close up its cell with a waxen covering; it is thirty-six hours in spinning its cocoon; in three days it changes to a nymph, or chrysalis, passes six in that form, and then comes forth a perfect bee. The male passes three days in the egg, six and a half as a worm, and on the twenty-fourth makes its appearance as a winged animal. The royal insect passes three days in the egg; is five a worm, when the bees close its cell, and it immediately begins its cocoon, which is finished in twenty-four hours. During eleven days, and even sixteen hours of the twelfth, it remains in a state of complete repose. Its transformation into a nymph then takes place, in which state four days and a part of a fifth are passed.”

F. Does she lay any eggs?

Mr E. On the fifth day after her appearance, she quits the hive; forty-six hours after she begins to lay eggs, and a hive will often contain forty thousand inhabitants, the most of them her own offspring. The first eggs of the queen always produce workers. She must be at least eleven months old before she begins to lay the eggs of males; the time she and the workers well know, and they take care to provide suitable cells.

F. That is very strange. Are the queen's cells like the others?

Mr E. No; they are like a pear with the stem downwards. When the queen lays in them, they are like an acorn-cup; after this they are quite closed up. Careful as the bees are at other times of materials and of space, when their future queen is concerned, neither is grudging. More wax goes to make the cradle of the infant queen than would build a hundred, or a hundred and fifty common cells, and on them no labour is spared.

F. Does a cell ever tumble, papa?

Mr E. Mr Walond, on looking at his bee-boxes one day, saw that a centre comb, burdened with honey, had separated, and was leaning against another comb, so as to prevent the passing between of the bees. This accident made the bees very active, but Mr W. could not see what was done. But, at the end of a week, he found they had made two horizontal pillars betwixt the two combs, and had taken so much of the honey and wax from the top of each as to allow the passing of a bee; in about ten days more there was a passage quite free.

F. How do the cells look, papa?

Mr E. As to their shape, I must talk to you another time. But, while building, they seem to be soft, not smooth, nor yet transparent, but of a dull white colour; in a few days they become tinged with yellow, and their edges become thicker, less regular, heavier, and so tough that they will bend rather than break. A glutinous substance may be seen round the opening, and threads of this are applied to various parts, as if to bind and strengthen the walls. This appears to be produced from the propolis of which I have told you. Beside painting and varnishing their cells, as I have just described, they strengthen the weaker parts with a peculiar sort of mortar. And it is remarkable, that, while our houses soon fall and decay, those of the bees grow stronger the oftener they change inhabitants. Every bee-grub, before it changes into a nymph, fastens its skin to the partitions of its cell, but without altering, in the least, the regularity of its figure. Accordingly, the same lodging may serve during summer for three or four grubs, one after the other, and next season, it may be used by an equal number. Reaumur found as many as seven or eight skins spread over one another, so that all the cells, being thus covered again and again, and well dried and cemented with propolis, daily become more solid. When, however, by these means the cells become too small, they are sometimes used as storehouses for bee-bread and honey; and, at others, bees are bred in them: these, therefore, are, of necessity, smaller, and form, in fact, the important class of *nurse-bees*.

F. Papa, how do they get the honey? For you said that, like Duncombe, they were makers of sweets.

Mr E. It is obtained from that part of a flower called the nectarium. To collect this, the bee has a trunk or tongue, which it can double up or lengthen at pleasure. It is not like a tube by which the fluid is to be sucked up, but like a tongue to lick away the honied juice, which the bee always knows where to find, though it is only lately that skillful botanists knew where it was. This sweet juice, conveyed by the tongue to the mouth, passes into the first stomach, or honey-bag; and when this is filled, the bee returns to the hive, and taking only a small part for its own use, puts the remainder into one of the cells, or delivers it to another bee at the entrance of the hive, and flies off for a fresh supply. Some honey-combs are always left open for the common use of the workers, but the greater number of cells filled during the summer are carefully stopped up until the internal supply of honey begins to fail. When, however, the honey is very plentiful, the bees lengthen their cells, or build new ones in which to store it.

F. Papa, I have just thought of something; can you tell us what is done when a queen dies?

Mr E. With pleasure, my dear, I answer your question, by relating one of the most astonishing facts in the history of bees. When a queen dies, they proceed to repair the loss. For this purpose they form several of their royal cells, and taking a common worker-worm out of the ordinary ones, they put it into a royal cell, feed it with royal food, and, in a few days, the worker becomes a queen. In many parts of Germany, the peasants, knowing this, shut up a few hundred working bees with a piece of honey-comb, containing common grubs three or four days old; the worker-bees immediately set about destroying some of the common cells, make royal cells instead, place the grubs in these cells, and give them food proper for grubs which are to become queens. This experiment never fails. In due time, a number of young queens is produced, all are destroyed but one, and she governs the hive. Thus hives are multiplied at pleasure. And now, my dears, have you any more questions to ask?

F. Not now, papa.”

THE OLD FAMILIAR FACES.

BY CHARLES LAMB.

I loved a love once, fairest among women;

*Closed all her doors on me, I must not see her—
All, all are gone, the old familiar faces.

I have a friend, a kinder friend has no man;
Like an ingrate, I left my friend abruptly;
Left him, to muse on the old familiar faces.

I have had playmates, I have had companions,
In my days of childhood, in my joyful school days—
All, all are gone, the old familiar faces.

I have been laughing, I have been carousing,
Drinking late, sitting late, with my bosom cronies—
All, all are gone, the old familiar faces.

Ghost-like, I paced round the haunts of my childhood,
Earth seemed a desert I was bound to traverse,
Seeking to find the old familiar faces.

Friend of my bosom, thou more than a brother,
Why wert thou not born in my father's dwelling?
So might we talk of the old familiar faces.

How some they have died, and some they have left me,
And some are taken from me; all are departed;
All, all are gone, the old familiar faces.

EMIGRATION.—UNITED STATES.
